MEDICAL SOCIETIES.
EPIDEMIOLOGICAL :
Diphtheria in Peru, 195
Researches in Historico Geographical Pathology, 195
Vital Statistics of Tasmania in 1861, 195
Yellow Fever, Notes of the Recent Prevalence of, in several of H.M.'S Ships of the West India Squadron upon their arrival at Halifax; with remarks on the Climate and Diseases of that Town, 85

ETHNOLOGICAL, 15
Richardson Dr., on Anomalous Exanthems, 427

JUNIOR MEDICAL :
Cooper, Mr. W. F., on Some Points in the Treatment of Delirium Tremens, 320
Election of Officers, 391

Modifications of Disease induced by the Tissues affected, 392
Tanner, Mr., on Uterine Hæmorrhage, 53
Yeo, Mr., on Ovariotomy, 464

OBSTETRICAL :
Air Expelled from Vagina, case of, 104
Double Uterus with Simultaneous Gestation, 7
Enormous Development of Hydatids in Omentum simulating an Ovarian Tumour, By Dr. Newman (Stamford), 104
Imperforate Rectum, attempt at Relief by Operation, 275
Large Fibrous Tumour Impeding Delivery, Case of a, 7
Medicated Pessaries in Uterine disease, 275
Nipple Shield, a New Description of and the Treatment of Sore Nipples, 7, 365, 444
Ovariotomy, Four cases of, 32
Phlegmasia Dolens, On the Vessels Concerned in the Production of, 33
Polypirite, for Crushing through the Necks of Uterine Polypi, by Dr. Aveling, of Sheffield, 7
Presentation of the Right Arm and Shoulder; Delivery by the Natural Powers, or Spontaneous Evolution, a case of, 32
Puerperal Convulsions Complicated with Mania, 365
Ruptured Vagina During Labour, 275
Spina Bifida Followed by Hydrocephalus, 275
Turning in cases of Disproportion, 156
Twin (?) Abortion, Report on a, Exhibited to the Society, by Dr. Langmore on June 4th 1862, 7, 104
Unsuspected Pregnancy, 275
Vaginal Closure, Five cases, of 365, 444

PATHOLOGICAL :
Adenoma of the Ovary, 319
Cirrhosis of the Liver, in a Child, 400
Diaphragmatic Hernia, 320
Dislocation of the Foot Backwards, 320
Embolism, case of, 399
Epiglottis, Destruction of the, 318
Femoral Artery, Plugging of the, 398
Guinea worm taken from the leg of a European, 399
Horn, as Removed from the Upper Eyelid of an old woman, 318
Leg, Elephantiasis of, 319
Medullary Disease of the Occipital bone, 319
Occipital Bone, Necrosis of, 399
Ovariotomy for the Removal of two Ovarian Tumours, 310
Recurrent Fibroid Tumour, 399
Skull, Punctured Wound of the, 399
Supra-renal from a patient who died of Morbus Addisonii, 319
Verruca Necrogenica, 319
Polypoid growth removed from within the Larynx, 400

ROYAL MEDICAL AND CHIRURGICAL:
Amaurosis Consequent on Acute "Abscess" of the Antrum, Produced by a Carious Tooth, 49
Aneurism of the Internal Iliac and Common Femoral Arteries treated by Digital Pressure, 70
Contributions to the Statistics of Cancer, Mr. James Paget, 89
Extensive Arterial Obstruction from Separated Cardiac Vegetations, followed by Gangrene and Death, Two Cases of, 49
Oil of Worms, Poisoning by, 443
Ovariotomy, Analysis of 162 cases, 389
Rupture of the Left Ventricle of the Heart in an Aged Female, aged Eighty-two, while reclining on her couch, Case of, 50
Scrotal Elephantiasis, Removal of Tumour, 387
Subcutaneous Treatment of Boils and Carbuncles, 50
Suspended Animation report of the Committe on, 50
Syphon-trocar for Ovariotomy and other Purposes, Description of a, 50
Ovariotomy History, and progress of, in Great Britain, 461
Hereditary Transmission, Contributions to the Natural History of, 442
Woman with three hands, Case of, Illustrated by Analagous Malformations with Lower Animals, 460

Art. 6240.

Efficacy of Oxygen Baths in Senile Gangrene.—Practical Value of the Pulverisation of Medicated Fluids.—Imperforate Anus; Mr. Guersant's Procedure.—Abnormal Anus Opening into the Vagina.—Chaps of the Nipple; Local Remedies Injurious to the Infant; Dangers of Nipple-Shields Manufactured with Adulterated Caoutchouc.

In another part of the present number (Art. 6253), our readers will find the particulars of a communication made by Professor Laugier, to the Academy of Sciences, on the Efficacy of Baths of Oxygen-gas in Senile Gangrene. The learned surgeon of the Hôtel-Dieu, after referring to the theoretic data on which the medication is founded, stated that he had resorted to the method in two cases; the subjects were aged respectively seventy-five and seventy-six years, and in neither was any anatomical change in the circulating system apparent on the closest examination. The pulsation of the *dorsalis pedis* artery was perfectly distinct in both instances, and there was no reason to suspect disease of the coats of this blood-vessel. The mortification was for two years and a half preceded by considerable pain in the foot, especially at the instep, and beneath the second toe,

The only treatment adopted consisted in placing the foot for one hour every day in a bath of oxygen gas, by means of a very simple and easily-constructed apparatus.

The gas was generated in a retort, containing chlorate of potash, and communicating by a bent tube, with a phial in which it passed through water; thence another tube, safely luted, conducted the oxygen into an ox-bladder. The latter was supplied with two other orifices, one for the admission of the foot, the other for the escape of the superfluous gas. An India-rubber band tightly fixed the bladder to the ankle, and the heating apparatus was a common spirit-lamp.

After five or six days' treatment, the pains decreased, the gangrenous patches contracted and assumed a roseate hue, and in a very short time, all pain and tenderness entirely disappeared. The second patient is still under treatment, but the first, who was admitted into the Hôtel-Dieu on the 17th of March, has left the Hospital. At the beginning of April, the eliminative process was far advanced. On the 10th, the eschar fell away, exposing a superficial and healthy-looking wound. The oxygen baths were persevered in, and complete cicatrisation was effected on the 24th of April.

— The inhalation of pulverised fluids, a question on which Mr. Poggiale presented four months ago to the Academy of Medicine a report, of which we published an abstract, has again given rise to a brief discussion.

After complimenting the learned reporter on the precision and perfect fairness of his statement of the facts, Mr. Durand-Fardel examined the principles which regulate the various procedures of inhalation; comparing pulverisation with the latter, he endeavoured to establish the amount of utility of the method in the treatment of thoracic disease. M. Démarquay's experiments tending to show the penetration, in animals, of a pulverised solution of sesquichloride of iron into the minutest divisions of the bronchi, and into the intimate texture of the lung, are, in Mr. Durand-Fardel's opinion, far from conclusive. What is true for the rabbit may not be equally true for the human subject; and if pulverised fluids do actually penetrate beyond the trachea, it is probable that they undergo changes of temperature and of composition, calculated materially to affect their curative properties. The orator further remarked, in confirmation of this view of the matter, that from all the clinical experiments on record, the benefits of the method would appear to be limited to affections of the mouth, fauces, larynx, and trachea. Hence, Mr. Durand-Fardel concludes, that, for the deeper seated-organs, it is more rational to have recourse to the inspiration of vapours and gases, which alone can be placed in immediate contact with the mucous lining of the bronchi.

The inhalation of pulverised fluids, even confined within these bounds, is a most valuable resource, highly creditable to the inventor, Mr. Sales-Girons, but further experiment will, perhaps, extend the range of its applications. We indulged for a moment in the hope that Mr. Trousseau would adduce in support of this anticipation, some instances of a nature to show that although medicated spray does not, perhaps, actually reach the bronchial divisions without loss of heat or chemical change, it may possibly exercise on the more deep-seated parts of the respiratory organs, an indirect action of a beneficial description. To our great regret, the learned Professor did not entertain this aspect of the question. He addressed the Academy after Mr. Durand-Fardel, merely confirming that gentleman's observations, and briefly alluded to the good effects of Mr. Sales-Girons' method in granular angina, œdema glottidis, specific laryngitis, but refrained from expatiating more at large on the pathology of diseases of the organs of respiration.

"The inhalation of pulverised mineral waters," said the Professor, "is productive of most remarkable therapeutic effects. I have, for my part, found it especially beneficial in granular angina, a disease termed in England *Clergyman's sore-throat*, frequently observed in singers, public speakers, and in all professions which require active vocal exertions. An eminent singer, who has bestowed much attention on scientific inquiries on the functions of the larynx, Mr. Bataille, has availed himself of this mode of treatment with the greatest success, and it has enabled him to resume a distinguished and profitable career, which he had for a time been compelled to interrupt.

"Twelve months ago, a woman who had been admitted into the Hôtel-Dieu, for small-pox, was suddenly seized with œdema of the glottis; the symptoms were so urgent that life was immediately imperilled, and I requested Mr. Robert to perform tracheotomy; before resorting to the knife, I thought it advisable, however, to give a trial to the inhalation of a pulverised solution of tannin; the relief was so instantaneous that the operation was postponed; the inspiration of the pulverised fluid was repeated at short intervals, and on the very same evening a perfect cure was effected.

"I was enabled quite recently to prolong, by the same procedure, the life of another patient suffering from tuberculosis, who also was attacked with œdema of the glottis; she was a pregnant woman on the eve of labour; the method referred to saved her for the time, and enabled her to reach the period of parturition.

"In syphilitic disease of the larynx, I have also found this medication most beneficial."

We may now, therefore, positively assert that the pulverisation of medicated fluids supplies the practitioner with a perfectly original and efficacious method of treatment, in laryngeal and pharyngeal affections. With regard to the bronchi and lungs, the effectual agency of the medication requires further experimental demonstration, and if it is confirmed by facts, it will become the duty of clinical observers, to describe with all desirable precision, its mode of action, effects, indications, and disadvantages, and to compare its power in the treatment of thoracic disease, with that of the other methods of exhibition of mineral waters.

— At the Society of Surgery, Mr. Depaul presented an infant, who supplies an illustration of the good effects of simple incision in cases of occlusion of the anus. When the operation was performed the child was three days old, the abdomen was distended and sonorous in front, but dull on percussion at the sides, especially in the left iliac fossa. On introduction of the finger into the *cul-de-sac*, which occupied the place of the natural orifice of the intestine, a membrane about five lines in thickness was felt, protruding slightly; during the screams of the infant it was the seat of obscure fluctuation. The operation consisted in puncture with a

narrow bistoury guided along the finger. Mr. Depaul then enlarged the aperture on the sides and at the back. The immediate escape of gas, and subsequently of meconium testified to the success of the procedure.

In the discussion which ensued, Mr. Trélat commended the diagnostic measures adopted by Mr. Depaul; percussion of the colon may supply useful information as to the extent of the occlusion. With regard to the operation itself, the results would, in his opinion, have been even more satisfactory, had the intestine been brought down, and attached to the skin.

Mr. Guersant next addressed the meeting, and described as follows the procedure he recommends, and the instruments he has used in similar cases.

After ascertaining the degree of protrusion at the perineum, the surgeon, if the infant is of the male sex, removes the contents of the bladder, and leaves the catheter in the urethra, in order to use it for the purpose of separating the urinary reservoir from the rectum. In little girls, the urine should also be drawn off, and the catheter inserted into the vagina, in order to increase the distance between the intestine and uterus, which is thus raised in the direction of the symphysis pubis. These preliminary measures having been completed, the actual operation should be proceeded with, and a small grooved trochar, incurvated so as to correspond with the concavity of the sacrum, should be inserted in front of the os coccygis, along the curvilinear course of the bones. When the intestine is supposed to have been reached, the blade is withdrawn, and if meconium escapes through the canula, a rod bearing a screw at its distal extremity, is adapted to the latter. The rod and canula, thus connected, form a convenient conductor in case further incision be required, or may be used for the purpose of placing an India-rubber tube in the rectum.

This procedure enables the surgeon, if he thinks fit, to introduce, after the removal of the canula, an instrument which Messrs. Bonnafont and Guersant have both been long in the habit of using to stretch the foreskin in the operation of phymosis, in order to grasp and draw down the extremity of the intestine, in case it should be desirable to secure it, after careful dissection, to the skin. The enlargement of the aperture made by the trochar, should be proceeded with as follows: The knife should be passed along the groove existing on the concavity of the trochar, which can readily be turned to the sides or back.

Finally, the operator should be provided with a small syringe, fitting into the canula; an injection can thus be made, and the inspissated meconium diluted in such a manner as to allow of its free egress.

This injection should never be attempted without the assistance of the canula, because, as Mr. Richet remarked, the fluid might otherwise pass into the cellular structures of the pelvis.

Mr. Morel-Lavallée, the president, having inquired if Mr. Guersant had often resorted to this *modus operandi*, was informed by the learned member, that he had frequently and successfully operated in this manner. When the puncture has thus been performed, said the Professor of the Hospital for Infancy, it is much easier to dissect the rectum and bring it down so as to fix it to the skin and prevent contraction. The freedom of the orifice should be further insured by the daily introduction of the little finger, a proceeding of obvious utility.

— We may also notice an interesting case, in which the intestine opened by a narrow sinus in front of the hymen, at the lower part of the vulva. The particulars were related to the Society of Surgery, and we extract the following details from the minutes of the proceedings of that Association, published in the *Union Médicale*.

The subject was an infant, born on the 7th of May, 1860, to visit whom Dr. Berrut was summoned to Marseilles on the 11th of the same month. The meconium oozed through the narrow aperture we have mentioned, and its escape had been facilitated by injections of warm water.

A grooved conductor was inserted into the tract, and its extremity was distinctly felt at the perineum; the surgeon performed an incision on the mesial line, in an extent of two-thirds of an inch, terminating at the spot usually occupied by the anus, and a transverse cut was also made at the anterior part of the longitudinal division. Mr. Berrut ascertained that, by this operation, he had exposed the intestine, which deviating from its natural course, was incurvated forwards. At a few lines from the aperture of the tract, he opened the intestine in four-fifths of its circumference, and drawing it down, secured it by five sutures, to the section of the skin.

These proceedings occupied a considerable time, and were interrupted by violent convulsions. Primary union was, however, safely effected between the rectum and the integument, and the ligatures were withdrawn on the sixth or seventh day. The intestine discharged its contents freely and frequently; the mucous membrane protruded slightly, and on the most superficial contact, fæcal matter escaped, a part of the liquid excrement making its way at the same time through the vulvar sinus.

After an interval of four months, as the child was progressing favourably, Mr. Berrut divided transversely the portion of the rectum attached to the fistular orifice; he performed a mere section, without resorting to suture, and also incised the remaining portion of the tract, from the recently separated region of the rectum to the vulvar aperture. The wound healed without difficulty.

In the course of a month, however, the anus contracted in so powerful a manner, that the functions of the bowel became again imperilled. Large tents were introduced, but caused such evident distress, that they were perforce abandoned. Mr. Berrut then had recourse to polished wooden rods, which he himself inserted twice a day for a minute at a time. Subsequently the father of the infant undertook this little operation, and passed three times a day the dilator, gradually increasing its size, and lengthening the time of its application. This method in the space of four months, completely overcame the constriction, and the motions became easy and regular. The contents of the intestine are now retained by the natural contraction of the sphincter, and escape only under the influence of expulsive efforts.

— Public attention has of late been called to a point of some interest connected with the welfare of new-born infants, namely, to the poisonous action exercised on the nursling by various local remedies employed for chaps of the nipple, and to feeding-bottles and nipple shields of india-rubber containing metallic oxides.

At a recent meeting of the medical society of the hospitals, Mr. Guérard pointed out the dangers for the infant of a popular method adopted for the cure of sore breast. The remedy consists in embrocations over the nipple with a fluid of unknown composition, the part being afterwards covered with a thin cap of lead, which is left as long as possible *in situ*, the patient carefully abstaining at the same time from any lotion of the breast. Mr. Guérard has remarked that the metallic plate shortly becomes covered with a layer of carbonate or acetate of lead, due to its contact with the acidified milk, and as very minute doses of any preparation of lead may occasion colics or cerebral symptoms, the danger to the child is obvious, if it takes the breast under these circumstances.

Teats, nipple-shields, the stoppers of feeding-bottles in vulcanised india-rubber, are in certain cases objectionable for the same reason. Dr. Eulemberg, a german hygienist of considerable celebrity, was the first who invited attention to the fact. Having noticed that some infants seemed reluctant to take these appliances into their mouths, that others, after having been nursed in this manner, suffered from vomiting, or other disturbances of the digestive organs, Mr. Eulemberg caused the caoutchouc employed in the fabrication of these instruments to be analysed by an able chemist, Mr. Richter, who demonstrated the presence of twenty per cent. of oxide of zinc in the india-rubber submitted to his inspection. The *Annales d'Hygiène*, on the other hand, supply us with the results of experiments performed at Duisbourg on the same substance, which fully confirm Mr. Richter's statement. Certain nipple-shields yielded as much as fifty per cent. of a mixture of chalk and oxide of zinc, in others, thirty-eight and thirty-five per cent. was discovered, and in some eighteen per cent. of *carbonate of lead*. The Royal Medical College

of the Rhenish provinces reported accordingly, and denounced the use of vulcanised caoutchouc containing oxides of lead or of zinc as extremely dangerous. At Dusseldorf and Berlin (July and August, 1861), the authorities ordered the shops where these objects are exposed for sale, to be visited by inspectors, and threatened the persons engaged in the trade with severe penalties in case commodities of this description, manufactured with *adulterated* india-rubber, were in future offered to the public.

Vulcanised caoutchouc, *i. e.*, caoutchouc combined with various proportions of sulphur, requires the addition of no other ingredient for the development of the properties that make it valuable. But, as it is sold by weight, some manufacturers do not scruple to add, besides the sulphuret of carbon and chloride of sulphur used in the preparation, other less innocent compounds, such as oxide of zinc, carbonate of lead, sulphuret of antimony, and even a mixture of sulphur and sulphuret of arsenic.

After pointing out the evil, the decrees promulgated on the subject indicate the remedy by describing the physical characteristics of teats made of *pure* caoutchouc. The latter present one or two visible sutures; their section is even, brown and shining; they are thin and elastic, and their texture is semi-transparent and brownish. The teats manufactured with adulterated caoutchouc have no joining; their section is dull, greyish, and dotted with white specks; they are thicker, unelastic and perfectly opaque. Another important difference is that the former float, and the latter sink when placed in water.

It is not impossible that Mr. Guérard's apprehensions with regard to the secret remedy he has denounced, or that the accusations brought forward against adulterated india-rubber, may be somewhat exaggerated. But when competent, sagacious, and experienced men warn us of a peril, it is but proper to take note of their suggestions, and to act with caution. With regard to teats and nipple-shields, the discrimination between those that are innocuous, and those which may be injurious is easy. As to the leaden cap, although it is left *in situ* forty-eight hours only, it is safer to prohibit its use altogether, and to resort to Mr. Legroux's excellent protective appliance, consisting in the formation of an artificial epidermis, calculated to resist all the efforts of suction, and which may be termed the true antidote of chaps of the nipple. (*a*)

LA CHARITE.

(mr. beau's wards.)

Favourable Influence of Antimonial Cholera on the Progress of Typhoid.—Acrodynia; Sulphurous Baths.—Stercoral Collection; Deceptive Appearances resembling Hematocele.

Although Mr. Beau prescribes medicine with a very sparing hand in general, those who attend his visits at La Charité, cannot fail to remark how frequently he takes advantage of the therapeutic effects of the tartar-emetic and ipecacuanha mixture.

The diseases observed in hospital, being in great part developed under the influence of the physical and moral destitution too common among the working classes, often present, as a prominent or secondary element, a dyspeptic condition which often assumes the characters of gastric disturbance, and imperatively calls for the exhibition of emetics. The therapeutic action of this class of remedies is proportionate to the amount of bilious matter rejected by the stomach, and copious emesis always relieves, when it does not entirely cure, the symptoms. Even without interrogating the patient, the physician can perceive, by the improvement in his countenance, that the emetic was the proper medicine to prescribe. This method speedily restores appetite, when the drug has acted with sufficient energy; in the contrary case, the results are less gratifying. When a sufficient quantity of bile has not been rejected, the object of treatment is defeated.

It sometimes happens, on the other hand, that the emetic action has been powerful, and yet amelioration does not follow; indeed, the drawn face, and sunken eyes of the patient clearly indicate an aggravation of his condition. In these cases, the physician is usually informed that after copious emesis, frequent stools have been passed. This is a most interesting form of artificial cholera, which may be called *antimonial* doubtless unimportant; when compared to the Asiatic form of the complaint, but which would rapidly assumed the gravity of the latter, if the use of emetics was persevered in. Symptoms of this description speedily subside when the medicine is discontinued.

This variety of cholera yields spontaneously, an assertion illustrated once more by the history of a patient recently admitted into the wards, of which the following is a brief abstract:

The subject of the case was a man suffering from feverishness, loss of appetite, and erratic pains in the joints; it was difficult to say whether these were the premonitory symptoms of eruptive, typhoid, or rheumatic fever, but, as the principal morbid manifestations were fever and articular pain, Mr. Beau exhibited sulphate of quinine as an arterial sedative. No improvement whatever followed in the course of the next twenty-four hours, and as the signs of gastric disturbance were then, on the contrary, better marked, Mr. Beau prescribed the following antimonial mixture:

℞ Antimonii potassio-tartratis, gr. ij.;
Pulv. Ipecacuanhæ, ℈j.;
Aquæ, ℥iv.

To be taken in two doses, with an interval of ten minutes. This medicine, exhibited on the 3rd of May, brought on severe symptoms of antimonial cholera, but on the morrow, spontaneous improvement took place. On the 5th, appetite was, in some measure, restored, and an eruption of varioloid made its appearance.

This is a singular and interesting form of cholera. It never proves fatal, but is especially deserving of attention, inasmuch as it occasionally checks suddenly the development of diseases which might have an unfavourable issue. Thus, Mr. Beau has, on several occasions, remarked at hospital Cochin, that it arrested at once the progress of incipient typhoid. Direct incompatibility of the two diseases with each other is not, of course, susceptible of positive demonstration, but it is an instructive and important fact that in cases in which typhoid fever was undeniably present that pyrexia was *entirely suppressed*, by the violent commotion consequent on the exhibition of powerful emetics.

— We noticed, among other interesting cases in Mr. Beau's wards, a patient, aged thirty, who suffers from *acrodynia*.

Outwardly, this woman presents no signs of ill-health; she appears even inclined to stoutness, but to estimate at its proper value this external characteristic of a sound condition, it should always be compared with the former state of the individual, a method which sometimes leads to the discovery that the apparent embonpoint is in fact but an attenuation of the system. Such was the case in this instance.

Two years ago, the subject of the present remarks, enjoyed perfect health, *and was stouter than at present*. At the age of twenty-one, she underwent much mental suffering, which,

(*a*) Gold-beater's skin, says Mr. Bouchut in his *Hygiene de la Première Enfance*, is a substance well calculated to answer the required purpose, but it must be agglutinated with a substance insoluble in saliva, milk, or perspiration. Collodion rendered elastic by the addition of ten drops of castor-oil, and twenty-two drops of essence of turpentine to the ounce, is an appropriate agglutinant.

Mr. Bouchut then reproduces *verbatim* Mr. Legroux's description of his plan of operation.

"A thin layer of elastic collodion should be spread in a radius of about fifteen lines around the nipple, and a piece of gold-beater's skin, perforated in several places with a pin, should be laid over. The collodion must not be applied over the nipple, as its contact would be productive of considerable pain.

"When it is necessary to nurse the child, the appliance should first be moistened with a little sugar and water, in order to restore its softness; the gold-beater's skin accommodates itself to the enlargement of the organ to which it continues to afford effective protection, and the sores and chaps generally heal in a few days."

Legroux further remarked, that in several cases of inflammatory swelling consequent on the disease of the nipples, this plan, by permitting lactation to be continued, had brought about a cure in a very short time.—The Editor

as usual, exercised an immediately unfavourable influence on the stomach. Dyspeptic symptoms, of various forms, set in, such as gastralgia, flatulence, pyrosis, yawning, uncertainty of appetite, a sense of epigastric weight, etc. In a secondary manner, she became subject to intercostal neuralgia, sharp lancing pains being experienced in the sides, and the intercostal nerves being especially tender between the shoulders in the spinal region. Gastric dyspnœa and guttural dysphagia followed, a combination of symptoms fairly representing hysteria, although no convulsive attacks supervened. She ultimately lost both flesh and colour, and became anæmic.

This is the history of many patients, and under similar circumstances, various forms of diathesis are readily developed, either from the agency of causes inherent in the individual himself, or extraneous and hostile in their nature. If a predisposition to tuberculosis had lurked in the system in the present case, this woman would most probably have become consumptive. She escaped this contingency, and may be considered fortunate in having passed unscathed through so dangerous an ordeal; but an affection of a different order lay in wait for her. In consequence of the dyspeptic and debilitated state gradually induced, doubtless assisted by a special idiosyncrasy, a spasmodic and rheumatic affection of the interossei muscles set in. Contraction of these structures first began in the hand, but has since yielded, and for the last three months, the patient has complained of pain in the legs and feet. She at first found it impossible to stand, the plantar region became exquisitely tender, and the skin of that part was found, on inspection, of a pale roseate hue, and covered with myriads of droplets of perspiration.

At first, the case might have been mistaken for one of mere cutaneous neuralgia, but further examination established its true nature, and showed it to be an instance of a well-specified disease, known under the denomination of *acrodynia*.

This complaint, which had doubtless existed before in a sporadic form, suddenly assumed the characters of an epidemic in the year 1828. It appeared in schools, asylums, and barracks, and isolated cases were likewise observed in Paris. It occupied the hands, feet, or shoulders, lasted four or five months and more, and, occasionally, induced permanent paralysis. It was sometimes complicated by the presence of œdema or erythema. In many patients, it co-existed with gastric disturbance, and yielded to measures calculated to relieve the latter. Seven years since, Mr. Beau had an opportunity of observing the disease in a cattle-driver, who, at night, suffered so violently from acrodynia of the feet, that his rest was utterly broken, and his screams were unappeasable; appetite was entirely destroyed, delirium and death followed, but dissection failed in pointing out any appreciable anatomical change.

This termination is fortunately unusual; acrodynia, when uncomplicated, has seldom a fatal issue. In the patient now alluded to, the intensity of the symptoms is moderate, and their persistency is perhaps due to the unsatisfactory general condition of her system. The local sedative applications which habitually give relief in similar cases have, however, here entirely failed, and sulphurous baths have, on the contrary, been productive of benefit. They will, therefore, be persevered in, but in this disease the practitioner must cautiously feel his way, and test the efficacy of various modes of treatment; electricity, chloroform, *baume tranquille* (vide p. 146, vol. 1. Engl. Edit.), or sulphurous baths must be tried in succession, until the remedy most appropriate to the requirements of each case has been discovered.

— A girl, aged twenty, was also admitted into the same wards for symptoms of an obscure character, which she had suffered from for a month. On examination, dyspepsia and amenorrhœa, together with extreme constipation, were ascertained to exist. Her bowels had not been relieved for upwards of thirty days. Mr. Beau, by attentive percussion, detected considerable dulness in the left iliac region, and the tenderness of the abdomen, on pressure, was such as to suggest at first the idea of hæmatocele. The symptoms, however, being also indicative of stercoral accumulation, the Professor at once prescribed aperients, which were rejected by the stomach. Enemas containing croton-oil were then resorted to, and some slight relief having followed the first injection, the treatment was continued with sustained good effects. In the course of a week the tumour gradually decreased, and finally disappeared almost entirely. A laxative was then exhibited, which met with no obstruction, and a complete cure was effected in a few days.

We shall revert to this subject on another occasion. Our object at present is merely to illustrate the utility of at once meeting the urgent indication arising from protracted constipation, in cases of abdominal disease of a dubious character.

The Medical Circular.

CLINICAL LECTURE.

ON INJURIES OF THE NOSE.

By ALEXANDER URE, Esq.,
Surgeon to St. Mary's Hospital, and Lecturer on Clinical Surgery.

Wounds of the nose heal readily. Your aim should always be to procure direct union. When the wound is extensive, and presents a flap, it will be expedient to introduce a few points of suture with fine silver wire, in order to secure exact coaptation of the cut edges, and thus prevent an unseemly scar. You have recently had the opportunity of seeing a patient under my care in the Accident Ward, who met with a severe lacerated wound of the nose from a fall. The edges of the wound were held together by means of sutures, and cloths dipped in cold water were sedulously applied. He had an attack of erysipelas of the face, which speedily subsided, and the wound healed nicely and without deformity. It seems hardly necessary to allude to the unlikelihood of reuniting a nose which has been completely severed. The annals of surgery, however, are not wanting in the records of cases where accidents of this kind have resulted favourably. The most remarkable instance is that detailed by Garengeot ('Oeuvres de Chirurgie,' tom. iii., p. 55) where the nose of a man, bitten off in a fight, and thrown in the dirt, was, after the lapse of half an hour, replaced, and eventually adhered. Should the wound be caused by a sharp pointed instrument, which has penetrated near the root of the nose, taking the direction of the base of the skull, and perforating the cribriform plate, it may readily enter the brain. Accordingly, under such circumstances, it behoves you to watch the patient assiduously, and to prescribe suitable measures for warding off, or allaying cerebral disturbance. Penetrating wounds of the nose sometimes take the course of the orbit. Here emphysema of the eyelids will ensue, should the patient make a forcible expiration.

Contusions of the nose occasion more or less effusion of blood, and ecchymosis, which may extend to the eyelids. They are often attended with fracture and displacement of the bones. It deserves notice, moreover, that they often determine accumulation of blood and the formation of abscess under the mucous membrane, which may induce headache and febrile symptoms.

Fractures.—Under this head are included fractures of the nasal bones, and, also, of the ascending process of the superior maxillary bone. These fractures are not very common, but are the most frequent of any of the fractures implicating the upper jaw. Owing to their small size, the bones of the nose are very strong, and are, moreover, firmly connected with the frontal and superior maxillary bones; and, being fashioned like a vault, are capable of resisting a considerable amount of external violence. Fractures are met with at all ages, except, perhaps, in early infancy. They result from falling on the face, or from severe blows inflicted in front or on one side, or from a projectile traversing the orbit or the mouth. Sometimes the fracture is slight, and attended with little or no displacement; at other times it is comminuted, and the fragments are pushed to the side, or driven into the nasal fossæ, producing notable disfigurement from the flattening or obliquity of the nose which necessarily follows. Fractures of the latter description are accompanied with severe bruising, and occasionally laceration of the integuments, and considerable swelling, which tend to conceal the displacement unless a searching examination be made immediately after the occurrence of the accident. The importance of instituting a narrow scrutiny in such instances cannot be too strongly urged; for if the displacement be overlooked, irremediable deformity will, in all likelihood, result. Bleeding from the nose is an ordinary concomitant, and in a case instanced by Rossi, the hæmorrhage proved rapidly fatal. Emphysema now and then supervenes in the face

and eyelids, especially when there is laceration of the pituitary membrane, and the patient happens to blow his nose in order to clear it of any loose fragments.

Where the lachrymal passages have been rendered impervious by impacted fragments, they may suffer inflammation and suppuration, and intractable lachrymal fistula may ensue. In like manner, contracted condition of the nasal fossæ may result from ill-united fractures of this organ.

The consecutive inflammation may occasionally induce abscess under the integument, or between the mucous membrane and bone, and if the suppuration be prolonged, partial necrosis may take place.

The nasal process of the superior maxillary bone with the nasal bones form, so to speak, the arch of the nose. The junction of the two nasal bones is supported by the nasal spine of the frontal bone, and the perpendicular plate of the ethmoid bone. Hence fracture of the nasal bones with *impaction* cannot happen without fracture of the perpendicular plate of the ethmoid.

Alarming symptoms referable to the brain often follow severe fracture of the nose. They have been attributed to displacement of the cribriform plate of the ethmoid bone, in consequence of the perpendicular plate of the same bone having been forced upwards. The cribriform plate, however, is not so prone to give way as many believe. It is the strongest part of the ethmoid, and is firmly connected with the frontal by the margins of the interorbitar fossa. Hence displacement of this plate can scarcely occur without fracture. It is far more rational to ascribe the head symptoms to commotion of the brain, the inevitable sequel of extreme violence, in this situation, and more particularly if the nasal eminence of the frontal bone be at the same time implicated. The following case in point: A man was brought into the Hospital, and came under my care, who had had the bridge of his nose shattered by the kick of a horse. He was stunned at the time, but recovered consciousness. In the course of three days delirium set in, and continued till within a day of his decease. He succumbed from exhaustion. The body was examined after death. There was a large open wound of the nose, from which pus exuded. The bridge of the nose was completely destroyed, a few loose fragments of bone only remaining. The ascending processes of both superior maxillary bones were gone, so that the orbits were opened into. The nasal cavities, ethmoidal cells, and frontal sinuses communicated freely by a large gaping wound. The fracture had not extended to the cranial cavity, and its contents were perfectly natural. We thus find serious head symptoms manifested in the sequel of fracture of the nose, and adjunct parts, without any appreciable lesion of the brain or its membranes, or of the horizontal plate of the ethmoid bone. It cannot be gainsaid that there may be simultaneous fracture of the cribriform plate of the ethmoid together with fracture of the nasal bones. In the event of fracture having damaged the dura mater and arachnoid membrane, the effect will be a serous discharge from the nostrils.

The diagnosis is sometimes difficult, as above stated, on account of the swelling of the soft parts adjoining.

The prognosis is, for the most part, favourable, unless the accident is complicated with mischief elsewhere, as in the above instance. Consolidation takes place in from fourteen to twenty days; according to Hippocrates in ten days only. In a case referred to by M. Malgaigne in his work on 'Fractures,' the vitality of the bones was such that they united, as it were, by first intention; there were no traces, either inside or outside, of any osseous deposit indicating provisional callus, and the fracture healed so as to leave almost no sign of any separation.

With respect to treatment, if the fracture is simple and unattended with displacement, you may leave it entirely to nature, otherwise the depressed portions must be raised without delay from within outwards, and this procedure is materially helped by the liquid effusion which takes place. It consists of carrying into the nostril a finger, a pair of dressing forceps, or some such instrument, to push up the fragments, while with the fingers of the other hand they are righted from without. Any abiding support is seldom required, as there is no muscular action to influence displacement. Should there not be sufficient steadiness, a dossil of lint, or small canula, may be introduced carefully, so as to distend the upper part of the cavity. For lateral deviations, if unyielding adhesive strips are inadequate, resort may be had to a cap of lead, or of gutta percha, exactly fitted to the nose. For an unusually complicated case, a special apparatus may be needed, such as that contrived by Dubois, and described by M. Malgaigne.

It is a singular fact, that the earliest application o the agglutinative bandage was made by Hippocrates, in reference to fracture of this organ. He directed the nose to be covered with a glue made from flour of March wheat, the object seeming to have been to fasten the nose to an exterior mould solid enough to keep it in form. Where the nose had been distorted to either side, it was attempted to keep it in place by means of a thong of leather smeared with *tanrocolla*, or glue.

With regard to the complications above pointed out, little need be said. Hæmorrhage will generally yield to the employment of cold; it has been stanched by simply holding up the arm. A young man was thrown down, with his face to the ground, and sustained a fracture of the nose, from which there was copious bleeding. Cold lotions having failed to check the latter, he was directed to raise his arm perpendicularly; the hæmorrhage ceased immediately, and did not recur. The propelling force of the heart was thus distributed, because, having to urge the column of blood up the arteries of the arm, it would act with less momentum on the carotids.

Emphysema commonly subsides without treatment. Splinters, if quite detached, may be removed, not otherwise. Should abscess form, it ought to be opened through the mucous membrane, as incision of the integument is to be avoided as far as possible, in order to prevent an unseemly scar.

If much deformity remains after the solid union is established in the instance of fracture of the nose, it is impossible to effect improvement in appearance by any surgical interference with the osseous structure. Good may be done, however, by bringing the cartilaginous framework into a suitable direction by means of its subcutaneous separation from the bone. Dieffenbach had a deformity of this kind to deal with, in which the nose lay upon the left cheek, with the right nostril upwards, and the left downwards. He carried a tenotome under the skin outside the nostril, divided the alar and dorsal cartilages at their junction with the bones, did the same on the other side, and in the septum, so that the cartilaginous part of the skeleton of the nose was perfectly moveable, and could be restored to its proper place. The cure is said to have been perfect.

I shall briefly conclude with pointing your attention to luxation of the nasal bones, simply for the purpose of making you cognizant of the fact that "the nose has been put out of joint," although the accident is one of extreme rarity. The possibility of this casualty is, indeed, admitted by Benjamin Bell and by Heister, but there is only one authentic case of complete displacement on record. M. Bourguet, surgeon to the hospital at Aix, has published, in the 'Revue Medicale,' for August, 1851, the remarkable instance in question of luxation of the bones of the nose, without fracture of either of these bones, or of the superior maxillary bone. A young man, twenty-two years of age, fell from a cabriolet; the left side of the nose happened to strike against the angle of the footpath; the nose had deviated to the right in its upper third, while at its lower part it had its natural direction; the skin was raised to the right by the lower margin of the bones of the nose; to the left there was a depression, behind which there was a prominence formed by the ascending process of the superior maxillary bone; above and to the same side there was this prominence formed by the upper margin of the left nasal bone; above that prominence, an empty space, corresponding to the articular surface of the frontal. The finger passed externally over the nasal bones did not detect any sign of fracture.

To obtain reduction, the following plan was resorted to: the litte finger of the right hand was introduced within the left nostril; the thumb of the same hand being applied upon the superior margin of the bone, which was prominent under the skin opposite the tendon of the left orbicularis muscle. A simple swing movement—that is to say, making straight the lower part, and pressing upon the upper part, allowed the left nasal bone to slip into its place; the slight prominence which remained on the right side was effaced by pressing from without inwards. All trace of deformity was thus removed, and the nose could be moved without the displacement being reproduced.

M. Verduc, a French medical man, mentions his being called to see a young surgeon who had luxated *one* of the nasal bones by a fall, as he judged, from the nose being twisted. To replace the bone, a little stick wrapped in a linen rag was introduced into the nostril with the right hand, pushing the bone strongly upward; while the left thumb was pressed upon the root of the nose; reduction was effected with a slight noise, and the cure was accomplished without any mechanical aid.

Diseased Meat.—At a recent meeting of the Police court, Sheriff Hallard presiding, Willian Robb, a flesher, residing in Causewayside, pleaded guilty to a contravention of the Police Act, in so far as on the 7th instant he had in his possessi on, in Lord Cockburn street, the dressed carcase of a cow which had died of disease, and was in a state unfit for human food. Robb was fined 10*l*. or thirty days' imprisonment. The fine was paid. Mr. Linton stated that he understood there was an individual residing not far from Edinburgh who fed pigs on the flesh of diseased cattle, but that when he got a carcase which he thought might pass with a little dressing up, he sent it to the market for human use.—Edinburgh Courant.'

An Indian Medical Graduate.—It is with much pleasure we notice (says the 'Bengal Hurkaru') that Baboo Chunder Coomar Dey, at the late university examination, obtained the degree of Doctor of Medicine, the first ever conferred in this country. The examination was of an exceedingly rigid character, and we congratulate this young man on the distinction he has so honourably gained. He has pursued his medical studies chiefly under the tuition of Dr. Goodeve. He is, we are told, proficient in seven languages, and in 1856 translated a German work into English. We shall always feel pleasure in recording similar instances of ability and its rewards, affording, as they do such example to the young students of India

LECTURES.

NATURAL ONTOLOGY;

OR,

THE SCIENCE OF ANIMATED BEINGS:

In a Series of Lectures first delivered at the Museum of Natural History, but now revised and corrected.

By M. FLOURENS,
Professor of Natural History in the College of France, &c. &c

(Continued from page 420.)

LECTURE XL.

In these paleontologic studies I have confined myself to facts and have not touched on any theories. The theories are chiefly two. The one may be called the theory of *successive creations*, and the other the theory of the *unity of creation.*

The theory of successive creations was that of Cuvier, and is now nearly that of everybody. The theory of the unity of creation was that of M. de Blainville. Let us examine a moment this last theory, which has been but very little discussed, and merits at least the attention of the physiologist. I will endeavour to collect and sum up here, I will not say the *proofs*, for that word would be too strong, but the *reasons* that most seem to militate in favour of the *unity of creation.* I take them from the great work of M. de Blainville. (*a*) These reasons are of three sorts; and may be called—1st, *zoological;* 2nd, *physiological;* and, 3rd, *philosophical* Let us now examine each of these reasons.

1st. The first and principal zoological reason is taken from the *unity of the animal kingdom.* There is not a twofold animal kingdom, a fossil kingdom, and a living kingdom. Each of them, taken separately, is but a part of the other, which, when united, form a perfect whole. They adapt and adjust themselves one to another, exactly as parts severed from a bas-relief fall into their places, when a bas-relief is being restored. In this way it is, as we have said, that the *plesiosaurus* comes between reptiles and the amphibia; that the *pterodactyle* connects birds with reptiles, &c.

Another *zoological* reason: the living group of pachydermata is one of the most mutilated and incomplete, and contains but eight genera, and each of these genera—elephant, horse, pig, &c.—presents a different type. Each of them seems isolated, and without direct relation with its congeners. But when the fossil pachydermata are brought into comparison with the existing pachydermata, the isolation of the latter disappears. The fossil pachydermata, which are very numerous, range themselves by their living congeners, and connect them together, so that the group of pachydermata, thus restored, offers a complete and harmonious whole. Could the naturalist reconstruct and *restore* the animal kingdom with fossils, as M. de Blainville has, in more than one part, so happily attempted, if the latter really belonged to a different kingdom? The unity of *the animal kingdom* being established, M. de Blainville deduces from that the *unity of creation.*

Cuvier said, when commencing his great labours, "Let any one ask why so many remains of unknown animals are found. . . . . and it will be seen how probable it is that they belonged to beings of a world anterior to our own. . . . . beings whose place is filled up by those that exist at the present day, to be, perhaps, some day destroyed in a similar manner, and their place occupied by others."

The theory of *successive creations* was, implicitly, contained in these memorable words. Cuvier's finest work, his *Discourse on the Revolutions of the Surface of the Globe,* seems to have had but one object,—that of developing and commenting on them; and he terminates that discourse by a phrase that may be given as the sum of all that thirty years of meditation and study had most profoundly imprinted on his great mind. "What is certain is this, that we are now at least in the midst of a fourth succession of terrestrial animals, and that after the age of reptiles, after that of paleotheriums, after that of mammoths, mastodons, and megatheriums, an age has now come in which the human species, aided by some domestic animals, peacefully rules and cultivates the earth."

Cuvier, therefore, admitted four epochs in the development of life on the globe—1st, the epoch of molluscs, fishes, and reptiles; 2nd, that of the paleotherinms; 3rd, that of the mammoths and mastodons; and 4th, that of man. Thus much being laid down, we ought not to find any animal of a given epoch mixed with those of another epoch, nor any of the animals of the present age among the animals of the age of the mammoths and mastodons; nor any animal of the mammoths among animals of the paleotheriums; nor any animal of the age of the paleotheriums—that is, any mammal (for, according to Cuvier, there were no mammals before the *paleotheriums*) in the age of the great *reptiles*, &c.

Now, the great reptiles, the plesiasaurus, the megalosaurus, &c., are found in jurassic limestone, where, consequently, no mammals whatever should be discovered. Yet, even in the time of Cuvier, there were found in the oolithic schists of Stonesfield—which are of the jurassic epoch—small inferior maxillæ, which were, by Cuvier himself, recognised as maxillæ of mammals of the order of the didelphs. Richard Owen has, from these débris, established two genera of fossil marsupials—the genus *thylacotherium* and the genus *phascolotherium.* (*a*)

Cuvier, on the other hand, looked on the non-existence, among fossils, of *quadrumanes* as an ascertained fact. According to Cuvier, these animals belong only to the last epoch—that is, to our own. Now, Richard Owen, Lartet, and others, have discovered, in more recent times, bones of quadrumanes, and that, too, in more than one place. Lastly, it is not man alone (to whom Cuvier assigns the exclusive character of the present epoch)—and so far seemingly with reason—that M. de Blainville pretends should exist, and even to have been found among fossil species. "Cuvier," says he, "deduces a final proof of these revolutions from the gratuitous negation of fossil human bones, of which there had been discoveries in his time, and of which there have been many since. To give support to this negation, he makes a distinction—'I say that human bones have never been found among fossils properly so called, or, in other words, in the regular strata of the surface of the earth.' This distinction, purely gratuitous, is contradictory, and cannot be admitted; for human bones have been found with the bones of lost animals discovered in the regular strata, and which have there no other character than in alluvial grounds: in one case the same bones would therefore be fossil, and in the other case they would not, for the mere reason that you would not admit as fossil the human bones with which they are found. But, then, human bones have been found in the regular strata. This last proof, therefore, like all the others, falls to the ground, and with it the theory of successive revolutions and irruptions, and repeated creations, which are a deduction therefrom."

3rd. *Physiological Reasons for the Unity of Creation.*—The great *physiological* reason is, that the sensible physiologist cannot admit the creation of a single *living being* without the direct intervention of God, without a miracle, and that it will always be prudent not to multiply miracles where there is no necessity for them.

We have seen that the elephant now extant, and the fossil elephant (the Indian elephant and the elephas primigenius) differ from one another so slightly, that Blainville, despite the authority of Cuvier, considered them as of one and the same species. But let us suppose that it is Cuvier who is in the right, and that these two elephants in reality form two distinct species; the difference assuredly cannot be great if it escaped the penetration of Blainville. Must it be supposed that the Supreme Creator, for so slender a difference, twice entered on the work of creation—first for the fossil elephant, and again for the elephant of the Indies?

From elephants let us pass on to *horses.* Here Cuvier plainly declares that the fossil horse cannot be distinguished from the living horse. "The genus *horse* was then also in existence. His teeth, in myriads, accompany those of the animals we have just named; . . . but it is impossible to say whether it was or was not one of the existing species, since the skeletons of these species are so much alike that a distinction cannot be formed from isolated fragments."

He says, in reference to the stag and ox—"the bones of stags and oxen, collected in certain caverns and in the clefts of certain rocks, are sometimes, in those situations, especially in the caverns of England, accompanied by bones of elephants, rhinoscerotes, hippotami, and those of the hyena, which are sometimes found in various alluvial strata with the same pachydermata; consequently, they are of the same age; but it is still no less difficult to say in what they differ from the stags and oxen of the present day."

4th. *Philosophic Reasons.*—These are rather an objection against the theory of *successive creations* than a direct argument in favour of the *unity of the creation.* The theory of successive creations rests only on *incomplete facts.* Nothing can be so restricted and imperfect as our explorations hitherto. Where are the localities in which they have been undertaken? To chance we owe the discovery of those rich deposits and vast caverns—the depôt of Sansan, the caverns of the south of France, &c.

How is it possible, with facts so imperfect, to propose views that can be more than provisional? No man was so much alarmed as was Cuvier with his own theory. "When I maintain," says he, "that stormy banks contain the bones of various genera, and alluvial strata those of several species no longer extant, I do not pretend that a new creation could be necessary in order to produce the species now extant; I merely say, that *they did not exist in the places where we at present see them, but must have been brought thither from other localities.*" This is shifting the question in no slight degree, and especially, and most dexterously (or at least very happily) removing from it the enormously embarrassing load of *new creations.* "Let us suppose, for example," continues M. Cuvier, "that some grand irruption of the ocean covered with a mass of sand or other débris the continent of New Holland; it would bury under it the bodies of kangaroos, phascolomes, dasyures, perameles, lizards, and ornithorynchi, and would wholly destroy the species of

(*a*) Ortéographic.

(*a*) Other mammals have been found, since Cuvier, in jurassic grounds, the *spalacotherium*, the *triconodon*, the *plagiaulax*, &c.

all these genera, since none of them now exist in other countries. Let the same revolution leave dry the numberless small straits that separate New Holland from the continent of Asia, a way would be opened up for elephants, rhinosceroses, buffaloes, horses, tigers, and all the other Asiatic quadrupeds, which would now become inhabitants of a country where hitherto they had been unknown. Now, let a naturalist, after having well studied the whole of this living nature, set about excavating the soil on which it treads, and he will there discover the remains of beings that are altogether different. What New Holland would be on the supposition we have made, Europe, Siberia, and a great part of America, are in reality; and it will, perhaps, be some day found, when the various countries of New Holland have themselves been examined, that they have all undergone similar revolutions, if not mutual exchanges, of their productions; for,—let us carry the supposition still farther—after this transportation of Asiatic animals into New Holland, if we admit a second revolution that would destroy Asia, their primitive country, they who should see them in New Holland, their second country, would be no less embarrassed to know whence they came, than we now are to discover the origin of our own."

I am persuaded that the future of the great problem that now occupies us—that of a *unique* creation, or of *manifold* creations—lies altogether in the ingenious and judicious views of Cuvier. They who speak of *new creations*, use an expression which they do not exactly understand. As Cuvier has said, there have been *exchanges;* there have been losses, and many losses; many species have been destroyed; but have there really been new *creations?*

MEDICAL SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

JUNE 4TH, 1862.

DR. TYLER SMITH, PRESIDENT, IN THE CHAIR.

Dr. MADGE related a

CASE OF A LARGE FIBROUS TUMOUR IMPEDING DELIVERY.

Mrs. H——, aged twenty-seven, primipara, well-formed, in good health, and who had gone her full time, was taken with slight labour pains on the morning of May 21st. On making an examination in the after-part of the day, I found the pelvis occupied by a large round tumour, which at first appeared to me to be the child's head. It seemed, however, to be lifting up, as it were, and pushing forwards the posterior wall of the vagina. It was low down, and came lower with every pain, and seemed to fill up every niche in the pelvis. The os uteri could not be found. Next day the tumour was occupying precisely the same position. The pains were still slight, and not frequent; the patient was in her usual health and spirits. With considerable difficulty, and by hooking my finger high up behind the symphysis pubis, I was enabled to reach the os uteri; it was directed forwards, dilated to about the size of a crown-piece, and, as well as I could make out, some part of the breach presented. (Dr. West, Mr. Spencer Wells, and Mr. Newton met me in consultation.) As some parts of the tumour felt soft and yielding, a trocar was introduced, and a small portion of fluid drawn off. Vain attempts had been previously made to push the tumour above the brim of the pelvis. Chloroform having been administered, the opening in the tumour was enlarged. Mr. S. Wells was then enabled to push the tumour upwards, and by means of a blunt hook the buttock was brought down. The child, when born, had some faint signs of life, but could not be made to breathe. In the early part of the following day the patient seemed to be doing well. A few hours afterwards, by fits and starts, she became very excitable, and could not be persuaded to lie still. Peritonitis set in in the afternoon, and she died on the third day after confinement.

Autopsy, eighteen hours after death.—The peritoneum was universally inflamed, and here and there were large dark-red patches; there was but little effused lymph. Some of the small intestines—a good deal distended with gases—were slightly glued together. The tumour was lying above and in a line with the uterus, nearly reaching by its upper border the epigastrium. It was attached to the posterior aspect of the fundus uteri by a large pedicle, and had thus been allowed to drop into the pelvis at or before the commencement of labour. I removed the uterus and tumour together; the whole weighed four pounds, the tumour forming, perhaps, a third of the weight. Involution of the uterus had not proceeded to any extent. The length from the fundus to the os uteri was eight inches, and the width at the widest part of the body seven inches and a half. The lining membrane was reserved for after examination. External surface studded with small fibrous tumours, the size of walnuts. No old adhesions about the broad ligaments, tubes, or ovaries. Diameter of large tumour, six inches and a half; it consists of fibro-cellular tissue, of a dusky-white colour, with irregular channels containing fluid, enclosed in a capsule of apparently uterine substance and fibres. The fibres of the capsule are so intimately blended with the white tendinous fibres of the interior, that enucleation would have been very difficult, if not impossible. (The preparation was accompanied by a drawing.)

TWIN (*I*) ABORTION.

Mr. J. C. LANGMORE showed a twin abortion. One fœtus, apparently of between three and four months, which was flattened, and had been dead some time, was expelled at the fourth catamenial period, after very slight pain, the placenta being retained and the hæmorrhage inconsiderable. After waiting three hours he consulted Dr. Priestley, who removed the placenta; and on again introducing the finger into the uterus to remove the clots, brought away a second and perfect ovum of about four weeks; it was adherent near the fundus; its members were healthy, and the embryo, as seen through the amnion, was fresh and vascular. The whole circumstance seemed to raise a strong presumption in favour of superfœtation having occurred.

A discussion then took place respecting the question as to the existence of superfœtation in this case, Dr. Priestly believing it to be an instance of the kind, but an opposite opinion being expressed by Dr. Routh and Dr. Madge. Dr. Braxton Hicks also remarked no the presence of certain appearances militating against this view of the case. Finally, it was determined that a committee, consisting of Dr. Harley and Dr. Tanner, should be appointed to report on the specimen at the next meeting.

Dr. AVELING, of Sheffield, exhibited his

"POLYPIRITE,"

for crushing through the necks of uterine polypi. It consists of a hook, a slide, and a screw. In using the instrument, the hook alone is first passed over the neck of the polypus; the slide is then pushed up as far as it can be made to go by the hand; and then, by means of the screw, the operation is completed by forcing the blunt blade of the slide into the concavity of the hook, and through the neck of the polypus. Dr. Aveling stated that he and others who had used the polypirite had found its application easy, rapid, and safe, and in no instance had he heard of the slightest hæmorrhage having followed its employment. The present instrument (which may be had from Messrs. Weiss) he considered a great improvement on two other instruments of a similar kind which he had invented in 1849 and 1857.

Dr. ROSE read a paper

ON A NEW DESCRIPTION OF NIPPLE SHIELD, AND ON THE TREATMENT OF SORE NIPPLES

Frequently failing in the successful application of the various mechanical appliances to be found for the protection of sore nipples, the author had had some glass shields made by Messrs. Gilbertson, of Ludgate hill, from a model which he (Dr. Rose) supplied, based upon the following principles:—1st. That the cylindrical portion should be long enough to ensure a space or vacuum between the end of the nipple when fully drawn out, and the end of the shield. 2nd. That the diameter should be sufficiently large to render strangulation of the nipple impossible. 3rd. That the shield should be smooth and unyielding, so as to avoid friction. 4th. That it should be transparent so that the flow of milk may be observed, and the position of the nipple ascertained. 5th. That the substance used for the mouthpiece should, as nearly as possible, resemble the parent's nipple, so arranged that it cannot collapse and allow the child to suck-in air. All these indications were entirely fulfilled by the shields exhibited, and the author stated that he had not met with a single case in which they had failed to answer the purpose for which they were designed. The application of a saturated alcoholic solution of gum benzoin and glycerine in equal proportions in all stages and in every variety of chapped and tender nipples was strongly advocated, together with the use of the shield as long as tenderness existed.

Dr. GRAILY HEWITT communicated a

CASE OF DOUBLE UTERUS, WITH SIMULTANEOUS GESTATION.

Mr. Grace was summoned by his father to see a patient in labour for the fourth time, aged twenty-six. Twice previously there had being premature birth; the third child did not live. When first seen by Mr. Grace, labour had been going on for fifteen hours; the waters had escaped. On examination, a hand was found presenting in the vagina, and the os about half dilated; but lying posterior to this another os was discovered, with the head of a child presenting Septum between the two half an inch thick, and extending up as far as could be reached. The anterior os was dilated, the child turned, and delivery effected. The placenta then followed. The child was dead, and apparently seven months old. The posterior os was next dilated, turning effected, and a live child extracted, which survived only a few hours. The placenta of the second child was expelled without difficulty. Both children were females, equal in development. No flooding or other complication interfered with the perfect recovery of the patient.

Dr. GRAILY HEWITT observed that the case, for the particulars of which the Society was indebted to Mr. Grace, was a very unusual and interesting one. In the elaborate work of Kussmaul on the Malformations of the Uterus, which contained a large collection of cases of various kinds, there were only two specifically recorded precisely similar to that observed by the Author of the paper. The case of Mr. Grace resembled other cases of double uterus recorded by Kussmaul in respect of the feebleness of the uterine pains, said to have been observed. Abortion and premature labour seemed especially liable to occur in cases of double uterus, and this fact was corroborated by the case then before the Society.

THE MEDICAL CIRCULAR.

WEDNESDAY, JULY 2, 1862.

MR. KIERNAN AND THE COLLEGE OF SURGEONS.

Once more we appeal to the Council in behalf of the claims of Mr. Kiernan to a seat at the Board of Examiners. On Thursday last, a meeting of the Council was held to fill up the vacancy, when ten members voted in favour of Mr. Kiernan, and ten against him. After several trials the same result ensued, so that it was necessary to adjourn the meeting.

This is a crisis for the College. Its reputation as a scientific body is at stake in this election. Mr. Kiernan is one of the first anatomists in Europe, and his presence at the Board of Examiners would enhance the dignity of the College in every University and Medical School on the Continent. He is, moreover, we believe, the only member of the Council to whom the honourable distinction of the Copley medal has been awarded. Surely the Council cannot overlook these claims. Mr. Kiernan is not a man of mere conventional status, but an original genius, a scientific anatomist of whom the College feels proud. The Council cannot pass him over without injuring its own good repute. He has had also a long experience as an Examiner, having acted in that capacity, for twenty years, at the University of London. We do hope, when the Council next meets to decide this question, that Mr. Kiernan's claims will be acknowledged in an unhesitating and generous spirit.

RED TAPE.

The 'American Medical Times' expatiates with a scorching wrath on the shortcomings of the American Government in failing to provide proper succour for the sick and wounded soldiers, now fighting the battles of the Union. This topic, unfortunately, is too familar to the English eye. The Crimean campaign made us acquainted with the horrors of war in all their ghastliness, and of the inefficiency of an unprepared government in all its hopeless and embarrassing ineptitude. The English heart groaned over the sufferings it was unable to alleviate, and resolved that no more, in this generation at least, should such avoidable woes disgrace the humanity of the national administration. The consequence has been that in our subsequent expeditions our troops have been provided with every necessary comfort, and they have retained their health as well in camp on a foreign soil as in barracks at home. On the march in the depth of a Canadian winter last year, our troops maintained their bodily vigour and mental cheerfulness, in a degree that exceeded our liveliest anticipations; and the nation felt deeply gratified that its efforts to protect the lives of its defenders had been eminently successful. On the same continent south of the Potamac, where the divided hosts of America are now contending with all the fierceness of civil hatred, and making the rank soil sweat with brothers' blood, a very different tale has reached our ears. Here the privations and mortality of the Crimean campaign are renewed, but on a scale far greater, and amid circumstances that forbid us to hope for effectual amelioration.

The public journals of America do not appear to deal frankly with this dreadful topic, being moved to secrecy either by fear of the government or from the apprehension of discouraging the people's zeal for this calamitous war. The 'American Medical Times,' however, does not recognise these influences, and has given us a peep behind the scenes which may make us all pray that this fratricidal contest may speedily be brought to a close. In the article to which we have alluded, the editor of that journal remarks:

"But when we pass from the free, spontaneous activity of our voluntary organisations to the sphere of official duties, we pass, as it were, from the tropical to the polar regions. All is now formality and frigidity. If there is a heart to feel, the features are stiffened, and cannot relax with sympathy; the hand is paralysed, and can give no aid. The power to relieve human suffering, sorrow, and death, are idle incentives to exertion. The official moves in a circle, his feet bound, and his eyes blindfolded. He seems deaf to all entreaties, and insensible to every appeal. He sees nothing, hears nothing, knows nothing beyond the limits of the official seat on which he has grown callous by long and undisturbed sitting. Red tape, official routine, dull and insensible formalism, are the curse of our government, and but for the generous activity of voluntary societies, would be the ruin of our armies. From every quarter we hear the same universal complaint of want of preparation, of tardiness to meet the exigencies of battles, and, in consequence of the sacrifice of human life, with a vast amount of needless suffering. The horrors of the battle-fields of Bull Run, Fort Donaldson, Pittsburgh Landing, Williamsburgh, &c., can never be written, and yet all occurred under circumstances which allowed of more or less complete preparation. The battle of Bull Run took place under the immediate inspection of the official head of the Medical bureau; it was planned weeks beforehand, and admitted the most ample medical provision; yet the nation has not and never will cease to thrill with horror at the mention of its name, and the recollections of the terrible sufferings which followed the disaster. At Fort Donaldson the poor sufferers remained for days uncared for, lying on the snow; not because succour was not at hand, for private bounty had furnished an ample supply and freely offered it; but because an official, rejoicing in the glittering bauble 'U.S.,' could not unwind the red-tape which bound his official legs, in forty-eight to sixty hours. Pittsburgh Landing found the same army utterly unprepared in its Medical Department for battle, and the first assistance that reached the sufferers came from Chicago, hundreds of miles distant, by private hands, after the news of the battle was received. Here was exhibited 'blood-red-tape' in its brightest colours. Tardiness and tedious formality marked every movement for days, while hundreds of wounded were weltering in their blood, unable to move a step from the spot where they fell. The recent battle of Williamsburgh was but a repetition of the same scenes, with all their sad and harrowing consequences. The wounded were left unprovided with attendants, shelter, or means of transportation, except of the rudest character. The principal provisions for the immediate care of the sick and wounded were, as in nearly every instance, made by the Sanitary Commission or charitable associations.

"In our military hospitals we find the same want of earnest and systematic labour. The sick and wounded are waiting at the threshold before the building is in readiness to receive them, though the emergency was long foretold; many of the hospitals are poorly provided with the necessary stores, though there is an abundance bound up in red-tape, near at hand. The removal of convalescents to distant localities is attended with the same delays, disappointments, and often-repeated failures. The difficulties attending transportation often seem insurmountable, so circuitous is the channel through which the proper authority makes known its behests.

"We recur to these facts with sorrow and shame. The genius of our government should make its official acts as free and prompt as are the sympathies of the people. War has its exigencies, and one of the most notable will be, we trust, the rejuvenation of every department of government. Already has it purged the Medical Bureau of much of its dulness, and energised its decrepid members with younger blood, and a more elastic spirit. This work of reform should not cease until every department is purified, and energy and efficiency supplant dulness and stupidity."

What is this but the cry of our own press reverberating from the Potamac,—Routine, red-tape and unpreparedness causing the disorganisation and ruin of armies, and impoverishing the state of its men, material, and money? There may be something of our Anglo-Saxon *laissez faire* in this muddle of incompetency; if so, let us not fail to profit by the lesson, and for the future, set a better example.

THE KING OF THE BELGIANS.—The last bulletin of the health of his Majesty, posted up at the Palace, but not published by the Belgian 'Moniteur,' announces that he continued to improve slowly. The improvement only applies to the pulmonary affection, as the medical men agree in declaring that the extraction of the calculous matter still remaining in the bladder can alone put an end to his Majesty's sufferngs. A fresh operation is to take place in a few days.

SUMMARY OF THE WEEK.

THE CORONERSHIPS.

The writ for the election in the Central District has been issued. The nomination will take place on Friday, the 4th July, and the polling on the following Monday. Since our last issue Dr. Challice has most properly retired and left the field free to Dr. Lankester, who is now the sole Medical Candidate for that District. Dr. Gwyn has also heeded our advice and withdrawn his pretensions, but we are sorry to say he has done so in behalf of the legal candidate—Mr. Bird. So much for *esprit de corps*. Dr. Mushet is now *the* Medical Candidate for the Western District, and will, we hope, have the support of every Medical Practitioner. It is much to be regretted that these contests cannot be conducted in a fair and open manner; but that men should come into the arena who have no serious intention of abiding the great issue. They play out a little plot of their own. We have already shown how these minor interests traverse the course of the more important drama. These manœuvres and undercurrents are rarely deemed deserving of notice, and it is not worth our while to dilate upon them in the present instance, as they are not likely to do any harm. Let them, therefore, remain in the darkness where they have been transacted.

THE SURREY COUNTY HOSPITAL.

The promoters of this Institution are going a-begging for a plan; they wish to establish a model hospital, and desire to be informed of the best method of construction. The Rev. Mr. Hatchard is particularly anxious to be helped to the formation of a correct judgment on the point. We can scarcely believe that this gentleman has not heard of the "Cottage" plan; but if he have not, we now tell him that this is the only one that will give him such a hospital as he desires. We know the timidity of men in dealing with new principles which they have not originated; but surely enough has been written and said about the Cottage plan, to justify the Rev. Mr. Hatchard and his colleagues in founding their proposed institution on this principle. Should they fail to do so, they may be assured that theirs will not be the "Model" institution they are ambitious of making it.

HANDCOCK *v.* WEBB.

It is with much satisfaction we find that Mr. Webb, of Pimlico, has been acquitted of a charge of indecently assaulting the plaintiff, one of his serving maids. The girl, being disobedient, was ordered to leave the defendant's service; this she resented, and raised a dispute about her wages, the result of which was a scuffle; a mob collected, and the girl charged Mr. Webb for an indecent assault. It is unnecessary to recapitulate the details of the case; the Jury were satisfied of Mr. Webb's innocence, and acquitted him. Mr. Webb is a general practitioner of much respectability, and has probably suffered deeply, both in mind and professional position, from such a cruel charge.

LONDON PUMPS.

Some time ago there was a formidable attack made upon the dignity and usefulness of the London pumps; and as the pumps are venerable institutions, they found many friends to defend their vested interests. Recently, indeed, under the joint protection of Dr. Lionel Beale and the City Chamberlain, the Pumps have shown a determination to carry the tide of battle into the ranks of their opponents. The City Chamberlain denies that the surface sewage of London penetrates to the wells that supply the pumps; and Dr. Lionel Beale maintains that the salines in well-water do not injure its quality, though he admits that decomposing animal matter entering the wells has poisoned many people, and might do so again; but this is an accident. He thinks that it would be beneficial "if we could supply the public with good spring-water instead of the mawkish stuff supplied by our present water companies;" and he points out means of effecting this object. We are very much of Dr. Beale's opinion, and are not sorry to find that the pumps have so respectable an apologist.

LADY DOCTORS.

It might seem selfish on our part to discountenance the attempts made by certain ladies to become Medical practitioners. In the metropolis they have managed to obtain a footing in some of the schools; but an attempt which they have recently made in Edinburgh to be admitted to the College of Physicians has met with a repulse. It is true the claims of the ladies were rejected by only two votes; and it is not improbable, therefore, that they may succeed on another occasion. What of that? Ladies never can succeed in the general service of the Profession. They may act with efficiency in purely medical cases; but in surgery, operations, and midwifery, their success would be only exceptional. Women, as a rule, have not that coolness and firmness necessary to encounter the severe accidents incidental to these branches of practice. They may act the part of midwives as they do already, but beyond that we do not expect much from their assumption of Medical duties.

We tell them, too, we cannot do without them in their domestic capacity; we prize them too much as amiable attendants, sympathising nurses, cosy comforters, and not always bad cooks and bed-makers, to be satisfied with their desire to turn off to other departments of duty. What shall we do if the ladies turn doctors, and lawyers, and printers, and we know not what besides? Let the dear souls be content to chronicle grocery bills and crochet cotton nightcaps; what can they desire to do that can contribute more to *our* happiness? For surely they are not so selfish as to think only of their own! And how can *they* be happy if *we* are not? Let them re-consider the case, and remain the good wives and daughters they are, and were from the beginning intended to be; though, we must confess, Eve was not half so good a wife as she ought to have been, and has left a bad example.

Association of Medical Officers of Asylums and Hospitals for the Insane.—Agenda for the Annual Meeting, to be held at the Royal College of Physicians, Pallmall East, on Thursday, July, 3, 1862.—12 noon. The Committee of Management meet at the Royal College of Physicians. 1 p.m. Annual General Meeting of the Association at the Royal College of Physicians. 1. Dr. Lator will resign the chair to Dr. Kirkman, the President elect; 2. Dr. Kirkman's address from the chair; 3. Receive the report of the Treasurer; 4. Election of President (and place of meeting) for 1863; 5. Annual election of officers—viz., Treas., Editor of the Journal, General Sec., Secretaries for Scotland and Ireland, two Auditors; 6. Election of new members; 7. The following communications will be read:—*a.* 'On the Cottage Asylum System,' by Dr. Mundy, of Moravia; *b.* 'On Middle-Class Hospitals for the Insane,' by Dr. Maudesley; *c.* 'On the Modes of Death among the Insane,' by Dr. Bucknill; *d.* 'On the Special Utilisation of Asylum Sewage,' by Dr. Robertson (with a ground plan of eighteen acres of meadow land thus irrigated at the Sussex Lunatic Asylum). The annual dinner will be held at the Star and Garter, Richmond, at 6 p.m. precisely; tickets, 1*l.* 1s., inclusive. Members proposing to dine are particularly requested to send their names to Dr. Robertson. Trains leave Waterloo Station (ten minutes' walk from the College of Physicians) for Richmond at 4.50 and 5.15, returning from Richmond at 10.35, due at Waterloo at 11.10.

The Botanic Gardens at Chelsea.—Some time ago the Apothecaries' Society, complaining of the burden of maintaining the gardens, offered to the College of Physicians, who stand next in rotation as trustees, to surrender the charge. The Society we understand, has recently rescinded their former resolution, and have announced their intention of keeping up the garded as a School of Botany. It is, however, surmised that some arrangement relative to another disposition of the property in contemplated in concurrence with the heirs-at-law of Sir Hans Sloane.

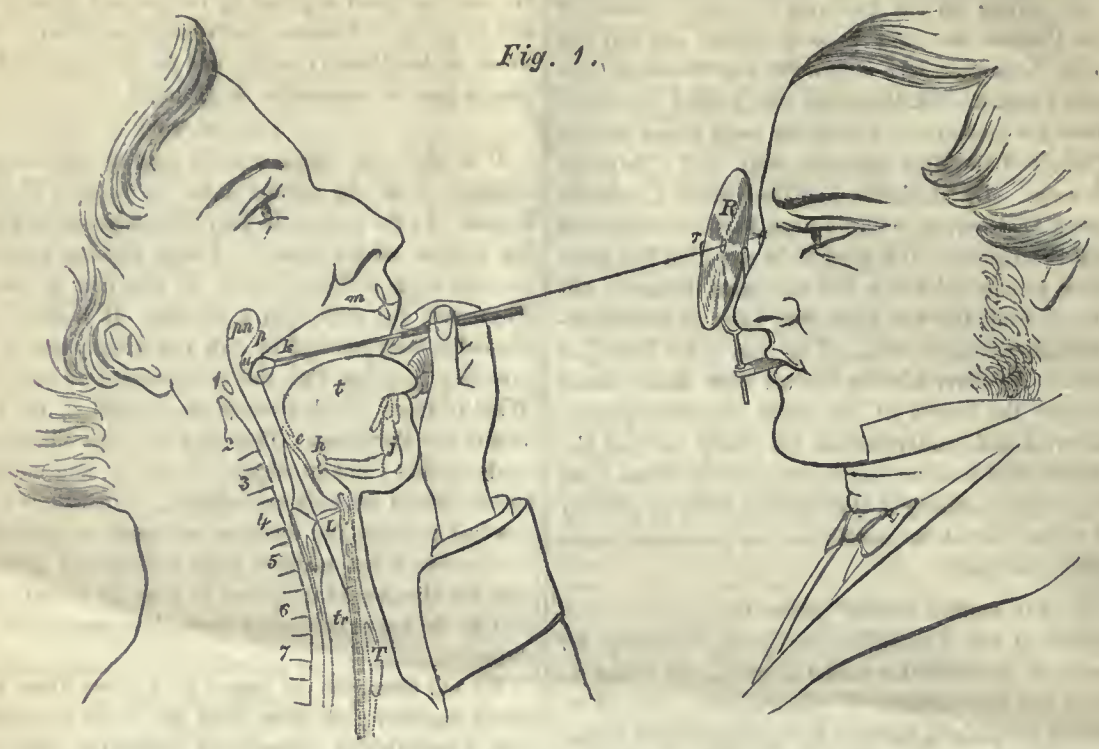
THE HISTORY OF THE LARYNGOSCOPE.

By JAMES YEARSLEY, Esq.,

Surgeon to the Metropolitan Ear Infirmary, Sackville street.

(Continued from page 454, vol. xx.)

Fig. 1.



Just as Professor Czermak has traced in the above woodcut his means by which an observer can explore the larynx at the present day, did Avery perform the experiment with his own apparatus in 1846. This point being established, we have now to consider what have been the results hitherto obtained, and how far such means are available in the ordinary practice of a surgeon or physician. I am afraid I must answer the latter question at once negatively, not only as the result of my own experience, but from observations here and there to be found in the works of Czermak, and others.

Notwithstanding the very commendable efforts of Dr. Czermak to stimulate others to practise the art in which he is himself so great an adept, we find him candidly saying that "the introduction of the mirror with facility and confidence, and, consequently, without any unusual excitement of the back part of the mouth; its prompt application to the most favourable and least sensitive spot; the habit of detecting and recognising the reflected image, particularly of those regions but little known and when the parts are moveable; the directions to be given to the individual undergoing examination to perform certain movements and to assume the attitude necessary to the most favourable arrangements of the various parts of the mouth and pharynx; in fine, the regulation of the light and of the visual direction—all these circumstances require a degree of practice and dexterity which can be attained only by *great perseverance*, conjoined with some preliminary knowledge, and some amount of natural skill.

"Those circumstances will always be very grave obstacles for the beginner, and will cause those physicians to hesitate in the employment of the laryngoscope, who do not intend to make a *specialty* of laryngoscopy."

But there is another element in the question which would militate more than all in limiting the practice of the art to a few—namely, the amount of time required for the successful exploration of any one individual case. It is not that there may be many Czermaks, many practised manipulators, but the misfortune is that every new patient requires a certain amount of training before you can apply your means of exploration satisfactorily—each throat must be coaxed into quiet submission; that watchful sentinel, the epiglottis, must be conciliated before he will permit you to peep over his shoulder into the depths of the passage it is his province to protect. Notwithstanding all these difficulties—these impediments to a general adoption of the method—it must be admitted that the value of the proceeding is not lessened by the exclusiveness of application.

There is already too much recorded in its favour to leave a doubt in the mind of anyone that in every large city one practitioner, at least, should be expert in the use of the laryngoscope.

By any determined student these difficulties may be surmounted; and when he has obtained confidence in himself, which experience and practice will give him, he will also know that by patience and *education* the most irritable throat in the most awkward of patients will be brought to submit readily to his manipulations.

In the few weeks I have myself applied the instrument, *secundum artem*, I have, on more than one occasion, been greatly aided by it in my diagnosis and treatment. My own personal experience of its use will be given in detail at no very distant period. My present purpose is limited to a mere historical account of these new means of exploration, and a reference to cases in which its utility has been plainly demonstrated. Thus do I hope to second the efforts of Professor Czermak in inducing others to test its capabilities. (*a*)

In the course of a long practice, I have never yet met with a throat, however irritable at first, in which I could not by tact, by coaxing, or by educating it, and biding my time, accomplish all I may have desired in the way of operations. So with laryngoscopy and rhinoscopy; by patience, perseverance, tact, and the necessary practice, the most intractable of throats may be made subservient to the required manipulations.

The following directions are given by Dr. Czermak for the examination of a patient's larynx by means of the laryngoscope:—

"The person examined places his hands upon his knees, the upper part of the body is advanced forwards, the neck bent onward, the nape slightly inclined backward, the mouth widely opened, the tongue flattened and held a little without.

"The observer is seated in front of the person to be examined; he places in his mouth the handle which supports the illuminating mirror, and looks through the central opening. The laryngeal mirror, introduced into the back part of the mouth with the right hand, is illuminated by the light which is projected from the illuminating mirror; the left hand can be placed upon the shoulder of the person examined, and steadies the chin and the nape, or in holding a tongue depressor, which we can often trust to the patient himself.

"In the first place, the illumination of the back part of the mouth and the mutual position are regulated; then the laryngoscope is heated, and its temperature regulated by the touch. After these preliminaries are gone through, we request the patient to open the mouth wide, and alternately to inspire deeply and to pronounce the sound *ah;* during this we endeavour to place the back of the laryngoscope against the uvula and the velum palati, to sustain these parts a little, and to give to the mirror a convenient inclination; at times it is impossible to avoid touching the posterior wall of the pharynx; the examination is directed by the image we thus obtain."

(*a*) I have been taken to task for acting contrary to the sentiments expressed in this Journal in an editorial article published June 18, headed 'Foreign Medical Interlopers.' I am as adverse as the writer of that article to foreigners engaging in practice in this country, and consider every man a traitor to his brethren who encourages them to do so; but, in upholding Professor Czermak, I am guilty of no such treachery. This gentleman is Professor of Physiology, and I have his authority for stating that, in no case does he prescribe. His vocation is simply to aid by the laryngoscope in diagnosis, and here his mission ends.

Since the publication of the foregoing directions, Dr. Czermak at the suggestion of Dr. Stoerk, of Vienna, is in the habit of holding the tip of the tongue in many cases, instead of using the tongue depressor.

The Woodcut, Fig. 1, in the foregoing page, represents CZERMAK'S LARYNGOSCOPE in its application, with a section of the throat and neck of the person examined.

1 to 7—the bodies of the Seven Cervical vertebræ.
p—the Soft Palate.
u—the Uvula.
pn—the Superior or Nasal Portion of the Pharynx.
m—the Palate Process of the Superior Maxillary Bone.
t—the Tongue.
h—a Section of the Hyoid Bone.
j—the Inferior Maxillary Bone.
e L—the Epiglottis and the Larynx, with a Section of the Cartilages.
tr—the Trachea.
T—the Thyroid Body.
k—the Laryngeal Mirror.
R—the Large Reflector, perforated by a Round Hole in the centre.
r—the Axis on which the Reflector moves.

The mouth-piece of the large Reflector *R* is held by the observer between the molar teeth.

The Reflector may also be held by means of a forehead frame, which adjusts itself like a pair of spectacles.

The rays of the sun or a good moderate lamp are concentrated by means of the Reflector on the Laryngeal Mirror, which is placed against the soft palate and uvula, *p u*.

The Laryngeal Mirror, *k*, introduced with the right hand, which supports itself on two fingers resting on the jaw, as represented in the engraving, is maintained at such an inclination, that it throws the light downwards, and illuminates the parts to be examined, and, at the same time, reflects the images of these parts into the eye of the observer. If, for instance, everything is disposed as the woodcut shows, the observer can look through the Larynx into the Trachea.

In order not to complicate the drawing, the observer's left hand is omitted; it may either be used to support the head in its position, or to depress the tongue with a Spatula, &c.

(To be continued.)

REVIEW OF BOOKS.

Manual of Midwifery. By Alfred Meadows, M.D.

There is no lack of handbooks on the obstetrical branch of Medical practice; but most of those, on a small scale, are limited to the purely practical points that present in the various emergencies of parturition. This little book comprises every branch of the subject, is clearly written, and is equally valuable to the student and the practitioner.

On Mammary Signs of Pregnancy. By J. Lumley Earle, M.D.

This little monograph is dedicated to the physician whose book on midwifery we have just noticed. The evidence of pregnancy derived from the state of the mammæ is no doubt liable to fallacy. Dr. Earle properly observes:

"It is only after the careful and minute examination of a large number of breasts, that we can attain sufficient confidence to form an opinion from the mammary changes. If the breasts of a dozen women were to be examined successively, they would probably be found to differ very much from each other; for example, the breast of one woman who was in the third month of pregnancy might present an areola an inch and a half in diameter; while another presented an areola only an inch wide in the last month of gestation; then the next two, one pregnant and the other not, might possess follicles on the areola; while another *enceinte* presented none, and so on."

The author notices the various elements of a diagnosis, such as size, pain, venous enlargement, white streaks or scars, areola, state of the nipple, &c., &c., and points out the circumstances in which these signs may give either deceptive or reliable evidence. We need go over these details, but we quote the conclusions to which Dr. Earle has arrived:

"The following is a summary of the most important points connected with the mammary signs of pregnancy, and the relative value of each sign.

"1. Both breasts should be examined.

"2. Any of the mammary signs may be found absent in an individual case; but the instances are rare in which all the mammary signs are absent at the same time.

"3. The mere enlargement of the breast as apparent to the eye is of no value in the diagnosis of pregnancy, while the sensation imparted to the finger by the hypertrophied condition of the proper gland structure is of considerable importance.

"4. The pain is the least valuable of all the mammary signs.

"5. The enlargement of the veins is a very important sign, especially when the enlargement is considerable, and above all when the veins traverse the areola; as far as I have at present noticed, venous branches traversing the areola are characteristic of pregnancy.

"6. The white streaks or scars are conclusive evidence of a present or former pregnancy, and, in the generality of cases, it is an easy matter to distinguish whether they are the products of a previous or present gestation.

"7. The increase of the diameter is most important in primiparæ.

"8. The increase of the colour of the areola is most important in the latter months of pregnancy and in primiparæ.

"9. The raised condition of the areola is characteristic of pregnancy, and is most frequently present in primiparæ.

"10. A shining appearance of the areola like polished wood is very characteristic of pregnancy.

"11. The secondary areola is a conclusive sign, and is generally most distinctly marked in primiparæ.

"12. The nipple is of no, or very slight, importance in questions of pregnancy.

"13. The branny scales on the apex of the nipple, though not characteristic of pregnancy, are of great value if they exist in large quantities, and if a small amount of fluid can also be expressed from the nipple.

"14. The mere projection of the follicles is of no importance unless they are present in a large number; but are conclusive evidence of pregnancy if they contain sebaceous material.

"15. The areola should be placed on the stretch in doubtful cases; (*a*) because if no follicles are present, those depicted in Fig. 3 may be brought into view by this means; (*b*) if follicles are present with an apparent absence of the sebaceous matter, the artificial extension of the areola may make that secretion visible.

"16. The follicles are seldom present in primiparæ.

"17. In multiparæ, the most important mammary signs during the early months of pregnancy is the sebaceous-containing follicle.

"18. In primiparæ, the most important mammary signs during the early months are the presence of milk in the breasts, and the raised condition of the areola.

"19. The mammary signs do not assist us much in determining the period of pregnancy at which a woman has arrived."

We must add that the author exhibits considerable power of discrimination, and has treated this subject in a sensible manner, and without any unnecessary pretence.

REVIEW OF THE PERIODICALS.

The 'American Medical Monthly.' *The Domain of Medical Police* in this journal, is a good summary of the objects and purposes of sanitary science. Of course, sanitary science means the annihilation of the causes of disease, to express which idea a new name has been invented—*Nosophthory!* The following paragraph reports a telling fact:

"The fertile and abused subject of Quarantine I must pass by. Good in its place, how bad is it out of place!

"In the protection of localities, it is believed that the most desirable quarantine is a dirt quarantine. 'Annihilate or exclude dirt, *i.e.*, putrefiable animal and vegetable detritus, and no migratory or malignant morbific poison can sustain its existence even if its cause be imported to the spot!' Thus, it is maintained that, by sanitary reform, all malignant epidemics are preventable; and it is interesting to know that this has been proved, even as regards plague, once the most destructive of all pestilences, and looked upon as the very type of contagion! It has now, so to speak, died out in those cities of the East to which it was formerly a frequent visitant, if not an endemic. Long ago it was finally excluded from all the parts of Western Europe, not by quarantine, but by improved local sanitary arrangements! Its fountain-head, the great Oriental capital, Cairo, before the time of Mehemed Ali, many times lost tens of thousands of inhabitants by its visitations. From here it spread, devastating over Egypt and the world! The viceroy named, and his son, Ibrahim Pasha (though unaware of the stupendously beneficial results of the undertaking), removed the hills between Boulâq and the mouth of the Nile, and transformed an immense swamp in the heart of the city, and the *recepticle* of all its filth, into a park, (or olive and fruit-bearing pleasure garden—the 'Esbekiah.') Other local sanitary arrangements were enforced, and now Cairo *(and with it, all humanity)* is free from plague!"

Dr. PETERS continues his observations on *Cainca* in the same journal.

The 'American Medical Times' contains a lecture by Dr. JACOB on *Dentition and its Derangements*, which exhibits a good grasp of his subject. Dr. A. CLARK, Professor of Pathology, contributes some *Remarks on Albuminuria*, made before the New York Academy

of Medicine. The Author does not agree with Dr. Wilks and others who think that the term "Bright's Disease" includes two or three different affections—observing :

"Now, Sir, with reference to this matter, it seems to me that the large white kidney, which is exceedingly well characterised in its appearance, and which has its own particular symptoms, is after all, but the result of a diseased action, which, by a little modification, can produce the small and contracted kidney, and that Wilk's additions are intermediate forms, and really the preparations in the kidney for one or other of these two characteristic conditions. I suppose it is proper to say, that Dr. Bright himself, in the paper which he published in 'Guy's Hospital Reports,' in the year 1836, page 381, while he seems to prefer the opinion that these different forms are really different stages of one disease, still holds the following language : 'There may, however, be some reason to doubt whether the different states of the organ are not rather evidence of modifications in the diseased action, than correct indications of the duration of the disease.' That, I believe, is the true view, Sir."

There is also a reprint in this journal of a paper on *Vaginismus with the method of Treatment*, by Dr. J. Marion Sims. We extract the following :

"In a case of vaginismus, the gentlest touch with the finger, a probe, or even a feather, produces the most extraordinary agony. The sensitiveness is at all parts of the vaginal outlet, is very great at the meatus urianus, and on each side of it, just where the hymen takes its origin ; is greater still on the vulvul or outer face of the hymen, near the orifice of the vulvo-vaginal gland, and greatest at the sulcus or reduplication from the vulval orifice. Often, the most sensitive point of all is at the fourchette, where the hymen projects upwards. I have often heard patients shriek with terror and agony, exclaiming that I was thrusting a dagger into the body, when I merely touched the sensitive points with a camel's hair pencil or a soft feather ; and again these same patients have declared that they felt comparatively nothing when I have had the parts held asunder, so as to pass a probe into the vagina, making forcible pressure against the internal or vaginal surface of the hymen, thus proving that, while the outer face of the hymen was supersensitive, its inner surface was normal. In all cases, the mere spasm of the sphincter is painful, and in many cases the sphincter ani feels almost as hard as a ball of ivory. Indeed, one of my patients supposed it to be a tumour to be cut out before she could be cured. The spasm of the sphincter is pathognomonic of the disease ; the supersensitiveness, diagnostic. The fact is more delicately shown by touching the outer surface of the hymen, particularly at its reduplication, with a soft camel's hair pencil.

"*Treatment.*—I shall not detain you with a rehearsal of the steps by which the proper treatment was finally determined ; enough has been said already to show that it was not accidental, as my observations extended from May, 1857, to August, 1859. The treatment consists in the removal of the hymen, the incision of the vaginal orifice, and subsequent dilatation. The last is utterly useless without the others, but is essential to easy and perfect success with them.

"I usually make two operations, though all may be done in one. Placing the patient, etherized, on the left side, I seize the hymeneal membrane with a pair of forceps, just at its junction with the urethra on the left side, and, putting it on the stretch, clip it with properly-curved scissors till the whole of it is removed in one continuous piece. In some cases the hæmorrhage is sufficient to require a compress of lint, thrust into the mouth of the vagina, while in others it is unimportant. In two cases the bleeding was excessive, but was easily controlled by the liquor ferri persulphatis. The cut usually heals in three or four days, after which the operation for radical cure may be performed.

"Notwithstanding the removal of the thick, sensitive hymen, the cicatrix marking the original place at the mouth of the vagina is excessively sensitive, and, in some instances, feels hard and tense, as if a small cord were constricting the outlet. This I formerly divided at different points, and in divers ways, during the course of experiments, and finally arrived at the following method as being the surest and best :

"Place the patient, fully etherized, on the back, as in the position for lithotomy, pass the index and middle fingers of the left hand into the vagina, separate them laterally so as to open the vagina as widely as possible, putting the fourchette well on the stretch. Then make a deep cut with a common scalpel through the vaginal tissue on the right of the mesial line, bringing it from above downwards, and terminating at the raphe of the perineum. This cut

forms one side, the left, *d*, *b*, of a . Then pass the knife again into the vagina, still dilating with the fingers as before, and cut in like manner on the opposite side from above downwards, uniting the two incisions at the raphe as shown by the line *d b*, which is to be extended quite to the perineal integument, and through its upper border, as shown by the dotted line *b c*. Each cut will be nearly two inches long, extending from about half an inch above the upper border of the sphincter vaginæ, across the sphincter for about half an inch, and down to the perineal raphe for nearly an inch more. Of course, this will vary in different subjects according to the development of the tissue in each. To perfect the cure, the patient will wear for a time a properly-adapted vaginal dilator. I use an instrument usually made of glass, sometimes of silver, or other metal silvered or gilt. I prefer glass, because it is cheap and easily kept clean, while, being transparent, it is easy to see how the wound is progressing without removing the instrument. Moreover, some patients have insisted that a glass instrument is more comfortable and less irritating than one of metal. I am not prepared to say whether this be true, yet there may be both truth and philosophy in the assertion, as one substance is the worst conductor of heat, and the other among the best. The dilator is sometimes introduced as soon as the operation is finished, especially if there be much hæmorrhage, which always ceases immediately in consequence of the pressure of the instrument. But most generally I do not order it for twenty-four hours after the operation, when it is worn two, three, or four hours. Its introduction is attended with a sense of soreness, but with none of the peculiar, agonising suffering, characteristic of the original disease. The instrument is usually worn for two hours in the morning, and two or three hours in the evening, more or less, according to the tolerance of the patient. I have been often astonished at the rapidity with which the cuts heal, the process being seemingly facilitated by the pressure of the glass dilator, which is to be worn daily for two or three hours, or until the parts being entirely cured, and all sensitiveness removed, the patient may be pronounced competent to fulfil comfortably and pleasantly the duty of a wife.

"The dilator is about three inches long, sometimes a little more, slightly conical, open at one end and closed at the other, and of different sizes, varying from an inch to an inch and a nalf in diameter. At the largest part near the outer extremity, there is a depression on one side for the urethra and neck of the bladder. It is open at the outer end to allow the pressure of the atmosphere to hold it in the vagina, which it does very effectively. When closed at both ends, a T bandage is necessary, and the instrument often slips. I found that a perfectly round cylinder, on being worn for three or four hours, always irritated the urethra and neck of the bladder ; hence, the urethral depression on one side, which also materially aids its self-retaining power."

The 'British American Journal.' Dr. De Bonald contributes a paper to this journal on the *Philosophy of Respiration and the Pneometer*. The author considers the effects of a sufficient, an insufficient, and an abnormal respiration on the various functions of life and the production of disease ; he then describes his new instrument the *pneometer*, which is intended to determine the expansibility of the lungs in all directions. The result ascertained from the use of this instrument conjointly, with the observations of others, are thus stated :

"From the conclusions we have drawn from the labours of authors who have written on respiration, conjoined with our own observations, the succeeding laws would appear to be established ; 1, That the quantity of air respired governs the quantity of blood ; 2, That the quantity of blood governs the weight, size, and height of the body ; 3, That every cubic inch of air respired represents very nearly a pound of blood ; 4, That every pound of blood in the body is equivalent to eight or ten pounds of the weight of the body ; and 5, That twenty-four pounds in weight of the body are about equivalent to an English foot in the height of the body."

The 'Medical Times and Gazette' commences with a report, by Dr. Wilde, of Dublin, on the *Number, Sexes, and Condition of the Blind*, with a narration of the means used for the maintenance and education of the blind in Ireland. The following paragraphs give us the leading statistics of the malady :

"In 1851 an attempt was made in Ireland (and, I believe, for the first time in the British Isles, or in any part of Europe) to note and classify the total number of persons labouring under diseases of either a permanent or temporary nature on a particular day. Among the former were enumerated the blind, of those who were, as expressed by the Census forms, 'quite destitute of sight.' From the returns so obtained we learned that upon the night of March 30, 1851, no less than 3,883 persons—1,426 males, and 2,427 females—were labouring under ophthalmia, of whom 3,465 were in the workhouses, auxiliary workhouses, and workhouse hospitals ; 236 were in Infirmaries, Fever, and General Hospitals, &c., and the remainder at their own homes. At that time the disease prevailed most in the County Cork, where as many as 1,133, or 1 in every 50 of the population on a particular day were affected. Taken in quinquennial periods, the ages at which the greatest number of

persons were effected with ophthalmia were '10 and under 15,' and from 5 to 10. Of the entire number affected, 84,136 were under 15 years of age.

"In the analysis of the potato failure, and the great famine and pestilence of 1846 to 1852, the Census Commissioners reported as follows upon the ophthalmia :—'As the sequel to the great pestilential period described in the report upon the tables of pestilence, &c., epidemic ophthalmia burst forth, and from the year 1849 to 1852, both inclusive, as many as 118,805 cases occurred in the Union Workhouses of Ireland alone, besides vast numbers in the rural districts, as well as in the different cities and towns. The disease prevailed most during the warm weather of June, July, August, and September. In the June of 1851 no less than 5,244 cases occurred.'

"According to the account of the Poor-law Commissioners, who for several years published statistical reports of this disease (as it appeared in the workhouses), sight was partially injured in 1,925 cases; in 1,270 one eye was lost; and in 517 both eyes were destroyed; so that, according to this calculation, 1 in every 35 of those affected suffered more or less. The total numbers who suffered from ophthalmia in the Irish Workhouses during the thirteen years from 1848 to 1861, both inclusive, was 199,773, or little short of *two hundred thousand*. Taking the summary of the months of all these years together, we find the disease at its minimum in December, when the average is 8,978, to July, when it rose to 25,290; after which it gradually decreased to the end of the year.

"With respect to the number of blind, we found from the inquiry instituted in 1851 that they amounted to 7,587, or 1 in every 864 of the population, the sexes being in the proportion of 100 males to 111·45 females. The proportion to the population varied from the town of Drogheda, where there was but one in 1,685, to, the city of Cork, where there was 1 blind in 447 persons. According to the provincial summaries, Connaught presented the least, and Munster the greatest number in relation to their populations. The proportion of the blind in Ireland was, according to the statistics then published, the greatest of any country of Europe except Norway, where, according to the returns made in 1845, the proportion was 1 blind to every 452 inhabitants.

"Of the Irish blind returned in 1851, there were 995 in workhouses; 4,920 in the rural, and 1,672 in the civic districts, or towns and cities composed of 2,000 inhabitants and upwards. Of the total number, 394 were pensioners from the British army."

Dr. Wilde then enumerates the numerous institutions established for the maintenance or relief of the blind.

Dr. Ephraim Cutter, of 3 Lansdowne place, Brunswick square contributes a paper on the *Veratrum Viride* as a physiological and therapeutical agent. This drug is said to be most efficacious in pneumonia, and Dr. Cutter thus explains its action in that disease:

"Compare it with venesection, once so much resorted to in these cases. The effects of depletion may be classed as three-fold :—(1.) It lessens the force of the current of blood, and diminishes its rapidity, thus guarding against its too forcible impulse upon the seat of inflammation; (2.) It exerts a sedative influence upon the nervous system, whose excitability is increased in proportion to the extent of the inflammation; (3.) it impairs the quality of the blood by a direct withdrawal of a portion of its solid and fluid constituents. As the blood soon regains, by endosmosis, its quantity but not its quality, it often renders a second and third depletion necessary, and still further diminishes the powers of life by an abstraction of successive amounts of chemical and histological elements which, at least, it requires time to replace. Now, the Veratrum Viride seems, both from its physiological and therapeutical use, to have the good effects of venesection—namely, the first and second mentioned, while it does not have the third indicated effect, which is the cardinal injurious and objectionable feature in blood-letting. Again, even when bleeding is well borne, it is a remedy that cannot be persisted in—to say nothing of that large class of patients whose easily-impressed nervous systems forbid further depletion, although the primary one has been followed by an increase of organic action even greater than before the operation. On the contrary, the Veratrum Viride may be used for an indefinite period with safety, and having once brought the economy under its influence by full and double doses, if necessary, the impression may be maintained by less doses, keeping the pulse at the desired point as long as the indications remain. (Dr. P. D. L. Baker, Eufala Ala. 'Southern Medical and Surgical Journal,' September, 1859.)

"It is very readily seen that if in pneumonitis, for instance, the pulse is at 120, and it is reduced to 60 or 70 or 80 beats per minute, the benefit gained is this :—'You very greatly diminish both the amount of the blood poured into the lungs in a given time, and the force with which it is ejected from the heart; you diminish the number of respirations, from the fact that you have diminished the functional activity of the lungs, and in this manner afford them such a degree of repose as is most favourable to a speedy resolution of the disease.' (Dr. W. Rogers, Green Island, New York, 'American Medical Monthly,' June, 1828, p. 410.) Whether this theory be accepted or not, the Veratrum Viride has been found practically to act thus."

The mode in which the remedy is administered is thus described :—

"In these cases it is the practice to push on in full doses of eight minims once an hour, till nausea, vomiting, paleness, and coldness of the skin, diaphoresis, diuresis, tingling in the extremities, inability to move the muscles, and a sense of prostration and impending death, observed by patient and friends, ensue. Thirty-two minims once an hour have thus been given in a case of puerperal peritonitis, and with a relief to the alarming symptoms. Having once thus established these effects, they are allowed to subside a little, and then kept up by smaller doses. Should they be too severe, they can be obviated by the free administration of alcoholic stimulants and opiates, as was done about thirty years ago by the subject of Example 3. And here it may be remarked that the writer's father, Mr. Benjamin Cutter, of Woburn, is in the habit of administering the Veratrum Viride to his puerperal fever cases, especially in wine, as a vehicle, and that he is very well satisfied with its results, thus combining a sedative and stimulant.

"*Toxicological Effects.*—No well authenticated case of poisoning has yet come to the knowledge of the committee. No doubt the nervous force could be overwhelmed readily enough, but the vomiting is a great safeguard. An invalid lady took, just as she was getting into her chaise to ride fifteen miles, fℨj. of the tincture by mistake for a preparation of iron she was using for a tonic. In half an hour she vomited it, and experienced the full effects of the drug. Still she prosecuted her journey, and recovered in a day or two. This is the largest dose known by the writer to have been given. Cases occur, once in a while, where patients thinking that if a few doses are doing them so much good, more will cure them entirely; where it has been given in double doses by different nurses not acting in co-operation; and where a child has drank it, not knowing what it was. In these the full effects being produced, both patient and friends are alarmed, and send in haste for the Physician, thinking the patient dying. He finds the case as stated, and on using the stimulants, or without, the bad symptoms soon pass off. The patient's anticipations of a speedy recovery have been known to have been realised in some cases. For this reason the writer would insist upon giving the Veratrum Viride in some simple vehicle, so that a teaspoonful of the mixture will represent the dose, and when nausea or vomiting begin to be felt, to stop and diminish the dose. The Veratrum Viride is given to persons of both sexes and all ages.

"Compared with digitalis the Veratrum Viride is sure, prompt, and not cumulative, according to the gathered experience. Compared with antimony its effects are not as permanent, it does not seem to directly change the character of the blood, and does not purge.

"The Veratrum Viride fails, so does opium and quinine. Our Physicians feel safe in calling it as reliable as any other article of the Materia Medica.

"In closing, the writer would state that he is provided, for testing, with a supply of the tincture, with root, seed, and botanical specimens,—the root having been collected under his own immediate supervision, and the tincture made by himself, being a similar preparation as that tested and employed by both the Middlesex East District and the Massachusetts Medical Societies. Any druggist can be supplied by addressing the writer,—Care of Thomas Morson and Son, 19 Southampton Row, marked "Order." He would be pleased also to give any further information, either by pamphlet or personal address to Medical men collectively or individually."

Dr. Hulford contributes the following *Three Facts in Physiology and their Meaning:*

"Professor Marey has proved by his ingenious experiments, that throughout the whole body all pulsations commence at the same time. This is now an established fact; but how is it to be explained? Only upon the principle of the auriculo-ventricular opening being closed to the mitral valve previous to the contraction of the ventricle. That this, also, is an established fact I have elsewhere shown. But both of these facts—the one based upon observations upon the periphery, the other upon observations upon the centre, are made still more probable by a third, known to most operating Surgeons—viz., that in ligaturing the femoral artery, if the vein be accidentally wounded, the bleeding immediately ceases on the application of a ligature to the artery. Not only are there many cases on record of this accident, but I myself once witnessed it in the hands of one of the most skilful and painstaking Surgeons. It was supposed by some present that only a small branch to the vein had been injured; but the patient dying, the femoral vein was found to have been wounded. To see whether the hæmorrhage from the vein ceased because the force from the heart was cut off, I performed the following experiment fifteen times, and with the same result :—A ligature was placed loosely round the femoral artery of a rabbit, and the vein opened a little lower down; it bled

freely; the ligature around the artery was then tightened, and the hæmorrhage ceased immediately. Here are, then, three facts full of interest to the physiologist—full of interest because they point the same way, saying to us,—Look at the distended left ventricle, with its mitral valve already *in situ*, the arteries of the body also full; the ventricle now propels its blood into the already full but not distended arteries; the larger ones yield immensely, the next in size less so, and the smallest least of all; the whole arterial system is acted upon as a cylinder of fluid, and the blood is propelled by the heart through the capillaries into the veins.

"The thoughtful Physician will gather from this that whenever, from thickening or deposit, the mitral valve cannot be raised by auricular, but requires, in addition, ventricular force, then must we expect retardation and weakness of the arterial current, with consequent sluggishness of the venous stream, local congestions, anarsaca, &c.

"One suggestion as regards ligaturing the femoral artery: Would it not be better to pass the aneurism-needle from the outer side instead of, as I believe is usually done, from the inner side? the vein getting so often external to the artery before the giving off of the profunda."

The 'Lancet.' Mr. WHITE COOPER'S *Memorabilia of Ophthalmic Surgical Practice* are continued in this Journal; and Mr. CONWAY EVANS contributes an article on the *Chlorine and Milk Treatment of Scarlet Fever and the Typhoid Fevers.* Milk is the panacea for fever, according to Mr. Evans; and its peculiar virtue is owing to the fact that it is converted in the stomach into "curds and whey." The author shall speak for himself:

"In giving milk to the fevered system, you have at once this most refreshing fluid generated in the stomach, and an unirritating solid formed, which in a greater or less degree repairs the waste of the living substance. The gastric juice converts the milk into what is popularly termed "curd and whey."

The author describes an epidemic of scarlet fever which came under his notice. The mortality at first was very severe, but Mr. Evans having, it would seem rather by luck than good guidance, prescribed a gargle in a particular case, the patient swallowed it, and unexpectedly recovered. Upon the authority of the nurse, the credit of the cure was given to this remarkable gargle. That our readers may not be in ignorance of this remedy, we extract the following sentence:

"About the fifth day the nurse said: 'She has been better, Sir, since she used that last gargle; the great restlessness is gone, the rambling talk has ceased, all putrid smell from the breath and evacuations has left. I believe,' she continued, 'it was the gargle which did it, for she swallowed the first dose.' This gargle was composed of a solution of the chloride of lime, alum astum, compound tincture of iodine, water, and a little tincture of capsicum.

Again:

"The nurse was so positive as to the cause of this favourable change, that she was directed to add a drachm of the solution of the chloride of lime to two pints of tepid water, with a little lemon-juice and sugar, and give it as a diet-drink to the patient. This, with a gruel and sago diet, an ammoniated effervescent mixture, and an occasional dose of rhubarb and grey powder and James's powder, were given, until it was safe to administer tonics and good diet. The disease spreading, the same diet-drink was adopted, and the use of chlorine extended by directing the body to be sponged, with tepid water containing it, twice a day. After the adoption of this treatment no fatal case occurred."

It is evident that the nurse deserves the credit of this success; but after all it would be difficult to say to what the cures were owing—whether to the chloride of lime, the ammoniated effervescent, the rhubarb, the grey powder, the James's powder, the tepid sponging, and so forth, for it is evident that Mr. Evans carried more than one arrow in his quiver, and shot them all. The administration of chlorines in fever is no therapeutic novelty. Dr. JAMES ARNOTT publishes a paper on *Local Anæsthesia from Cold* in the same journal.

ENTOMOLOGY.—Mr. Drury's entomological cabinet, recently sold in London, contained no less that 11,000 insects. One specimen of Scarabæus Goliathus sold for twelve guineas and a half.

THE NEW COLLEGE OF PHYSICIANS, DUBLIN, from the design of Mr. W. G. Murray, is now in course of erection. It is considered that the building will be extremely well adapted to the uses of the College.

GENERAL CORRESPONDENCE.

POISONING BY SULPHATE OF ZINC.

To the Editor of the Medical Circular.

SIR,—On reading the two cases of poisoning by sulphate of zinc, related by Dr. Fowler, I have been forcibly reminded of a case that once occurred to myself. In the summer of 1858, I went to take charge of the practice of the late Dr. Jackson, of Holytown. Only a few days after landing, happening to be in the laboratory rather late one night, a girl came in and asked for a dose of salts. The drawers in the shop, absurdly and carelessly enough, had no labels, so that I had to guess at the contents. But unfortunately, one of them was open, and thinking it to be the material required, I filled up a paper without weighing, and handed to the girl. The following evening, I received rather a hurried message from the same girl, saying that her mother had been taken suddenly ill. On arriving at the house, I found it almost crowded with people, and my first duty was to cause the majority of them to make a speedy exit. My next care was to turn attention to the patient, who I found to be a middle-aged woman, lying dressed upon the bed. On asking her what was wrong, I received no answer, and on laying my fingers on her pulse, I was not a little alarmed when I found it quite imperceptible. I then directed a few hurried questions to the husband, and he, in rather a savage manner, told me that the "*medicine*" I had given her had produced the whole of this, and ended by saying that he did not believe it was Epsom salts at all, as it had a far bitterer taste, and she had immediately vomited on swallowing the draught. A very small quantity of the solution still remains in the cup, so after testing this, the truth at once flashed across my mind; I had committed a grievous mistake; I had given *sulphate of zinc*, instead of Epsom salts. What was to be done? There my patient lay, pulseless, cold, collapsed, the heart beating feebly, and occasionally cramped in the extremities. Seizure by officers, imprisonment, trial in a court of justice, a verdict of manslaughter, probably penal servitude; these and a thousand reflections fleeted across my cranium in an instant.

Not a moment was to be lost, so I summoned all my presence of mind, and issued certain hurried directions to those in the room, to obtain warm bottles and warm bricks, while I myself seized a teapot by the fire, and poured out a quantity of hot tea, which most fortunately was in it.

This I mixed with a full teaspoonful of aromatic spirit of ammonia, and administered in divided doses. Meanwhile, hot bricks and bottles were procured and applied around her person, while I apportioned a limb to each attendant, and directed them to rub most assiduously with warm flannel. Before I arrived, she had had a most copious evacuation of the bowels, though none afterwards. The first portions of tea were immediately vomited, and she continued to retch for some time after, though gradually the stomach became tranquillised and retained the warm fluid.

Our efforts were continued for nearly two hours, when, at length, I had the ineffable satisfaction and relief of seing her look up and say, "Oh! Doctor, what a shame it was to give me that medicine." Never shall I forget the mental relief I thus obtained. The stomach was now quite quiet, and by the steady administration of the warm tea and aromatic ammonia, her pulse soon regained its normal strength, and the natural temperature returned. For some time she continued to suffer from pains and discomfort in the stomach and bowels, which, however, gradually subsided, and she recovered her wonted health.

Respecting the quantity taken in this case, I should say, certainly not less than ℥j., probably an ℥iss. Not having weighed the drug, I am unable to speak positively, but from the bulk, I should say nearer ℥iss. than ℥j.

The excellent effects of the warm tea seem to bear out the remarks of Dr. Fowler, as to its administration as an antidote.

The above case should, along with others constantly occurring, act as a warning to druggists and surgeons who have laboratories, to keep all their bottles and drawers properly labelled.

Yours, &c., J. BRISBANE, M.D.

Galashiels, 20th June, 1862.

THE CARMICHAEL PRIZES, WITH REMARKS BY THE TESTATOR ON MEDICAL REFORM.

To the Editor of the Medical Circular.

SIR,—Every now and then inquiries are made in the Medical journals respecting those prizes which were offered by bequest for the best and second-best essays on the state of the Medical Profession, "with a view to render it a more respectable and efficient body." Such being the avowed object, the Profession at large is interested in the matter, and in knowing why the benevolent intentions of the testator have not been carried out. No special conditions or programme were imposed upon the writers of the essays, though certain suggestions were made as to the topics to which their attention ought to be more especially directed. The award of the prizes was to rest with the Committee of the College of Surgeons of Ireland, which, however, unwarrantably delegated the

power to three of its members, and it is scarcely necessary to say that so small a junta would be more likely to be biassed in their judgment, or to entertain circumscribed views on the subject, than the larger body. Several essayists responded to the appeal, and having devoted a considerable share of my attention to the medical organisation of this and other countries, I sent in an essay which entered fully into the consideration of the various parts of the question; but although favourably spoken of in the report made on the essays, it was nevertheless stated not to have fulfilled all the conditions of the programme.

A short time ago, I addressed a letter to the President of the College, stating the above-mentioned circumstances, and reminding the Council that competitors were induced to take the trouble of composing essays in the *bonâ fide* expectation that the prizes would be awarded as directed. I further stated that portions of my essay had been published at my own cost, and had been very favourably reviewed in several Medical and other journals in England, America, France, and Germany, but that I could not put myself to any more expense in publishing the remaining parts—treating of medical studies, hospital elections, examinations, private practice, &c.—and that I had reason to believe the real cause of the rejection of my essay was the suggestion I made to substitute for the numerous existing licensing bodies three central Examining Boards—in London, Dublin, and Edinburgh—(which suggestion, as tending to deprive the Dublin College of its licensing privilege, was not likely to be approved by the adjudicators) and I submitted to the Council, as no further steps had been taken with regard to this bequest, whether some compensation from that fund should not be made to those competitors whose essays were highly spoken of, and who used their best endeavours to second the wish of the testator. To this letter I received an answer to the effect that the Council were not empowered to comply with my request.

My chief object in competing, was the anticipation that my essay, if published under the sanction of a Medical body, that showed itself to be actuated by higher motives than a desire to promote its corporate interests, or to retain privileges if proved to be incompatible with the interests of the Profession, would attract more attention, and be likely to do more good than if merely emanating from myself individually. Besides, I think it unjust, that when a sum of money was specially allotted by a wealthy and eminent member, to the purpose of endeavouring to improve the Profession, others less favourably circumstanced should have to make sacrifices, and be left to their own unaided efforts to achieve this object. That no essay superior to mine could be produced, was proved by the fact, that though the amount of the prizes was subsequently doubled, none was forthcoming; and the futility of the excuse, that it did not fulfil the conditions of the programme, is likewise shown by the amount of matter comprised in upwared of 400 folio pages of MS., and by the encomiums of the press upon the parts already published. Moreover, my attention having been just called to the observations made by Mr. Carmichael himself, as President of the Medical Association of Ireland (as reported in the 'Dublin Medical Press' June, 1820), I there find suggestions for improving the state of the Profession very analogous to those offered in my essay. As these observations, so forcibly expressed, are nearly as applicable to the state of matters at the present juncture, as to that existing at the time they were uttered, and as they seem to be especially *à propos* to the results of the recent division in the Medical Council, respecting the regulations promulgated in opposition to its authority, and to the spirit of the Medical act, by the Council of the College of Surgeons—inasmuch as they tend to show the incorrigible nature of some of the corporate bodies, and point out the most efficient remedy for the evil; no apology is needed for making the following extracts from them.

"That men, incompetent to the due performance of this duty (the charge of the health and lives of the community), are everywhere to be met with, is obvious to every one. But it could not be otherwise, since there are eighteen (at the present day many more) chartered corporations or colleges, empowered to grant licenses to practise, which, instead of competing with each other, to supply for the public service, the most highly-qualified and well-informed practitioners exert, a miserable rivalship only in the accumulation of money. This state of the Profession calls loudly for legislative interference to prevent a continuance of the evils which must, in consequence, be inflicted on society.

"If it (Warburton Bill) does not lay the axe to the root of the evil, and deprive the several existing corporate bodies of their licensing power, who thus, in the abandonment of all principle, sell their honours to the highest bidders, but lowest in point of competence, they may as well allow the present system of misrule and abuses to remain unmolested. The people are not judges of the qualifications of a Medical man, therefore the necessity that a paternal government which watches over the health of the people should take special care to provide them with well-educated practitioners in medicine, leaving *then* the market open where the selection can only fall on a *materiel* of good quality. Physic and surgery should in education be combined; and pharmacy encouraged as a science distinct from both. There should be but three licensing bodies, one in each capital of the empire, who should, by frequent communication, preserve uniformity of education, and equality of examination. It is only in this way that the ranks of a Profession, at present crowded to excess, and sadly interfering with each other, can even *in prospectu*, be legitimately thinned. The license thus obtained would permit the possessor to practice either physic or surgery, or both in every part of the empire.

"When the number of licensing bodies is reduced to three, and the qualification to be permitted to practise shall be raised to a much higher standard than at present, the Profession, from this cause alone, will rise in public estimation, for society will no longer be inundated, as it is by unnecessary and struggling hordes of Medical men. There is no thinking or candid man in the circle of our Profession, that does not admit the absolute necessity of Medical Reform. At present, the public are totally destitute of protection against the schemes of interested or ignorant pretenders to Medical science. Not only the health but the life and liberty of any individual is at the mercy of the man who chooses to dub himself doctor. Let not, therefore, secret and underhand manœuvres of interested individuals be permitted to oppose the welfare of the public. Our object is to raise the qualification of candidates to the very highest standard, and thus to elevate the Profession itself, by keeping out the tag-rag-and-bobtail, that unfortunately for its character, and the interests of society, are, from the abuse of the licensing power, every day making their way into its ranks. While I admire the thirst and energy of not a few members of our Profession in seeking for Reform. I cannot but lament the apathy of too many of our brethren respecting the state of Medical practice. If no *esprit de corps*, or feeling of honourable professional pride can excite them, perhaps self-interest may; and let them recollect that must arise from union, which, when better organised, must advance the interests of the Profession, not only collectively but individually."

I am, &c., EDWIN LEE.

London, June 16. 1862.

THE LARYNGOSCOPE AND "PULVERISATION OF FLUIDS."

To the Editor of the Medical Circular.

SIR,—A very interesting addition to, or carrying out of the objects of, the laryngoscope has been recently made in what is termed the apparatus for "pulverisation" of fluids, by means of which a patient with ulcerated larynx, or irritable cough, is enabled to breath a fine spray for hours at a time, as if standing on the side of a ship in a breeze; this apparatus essentially consists of a matter like an ordinary quart syringe, in which certain atmospheric pressure is given to some ounces of fluid which are thrown out in a very fine single graduated column, as fine almost as a hair, with enormous force, but which, impinging on a fragment of gauze, is broken into a beautiful bland, easily respired "spray." This inhalation of spray is so like inhalation of chloroform that it is very deserving of the notice of the Profession; in hæmoptysis or bleeding from the lungs or wind-pipe, by using a solution of acid or tannin, it acts like a charm. Even such medicines as iron or iodide of potassium, or quinine added to the solution, and simply breathed in form of "spray," reach the minutest air-cells, and may be detected at once almost in the urine of an animal exposed to its action. In what is termed clergyman's sore throat, it promises to be most valuable, as also in syphilitic ulcers of the pharynx and larynx, or in those apocryphal cases where it is said the solid nitrate of silver, or sponge charged with the nitrate have been passed through the chink of the glottis. In whooping-cough, if the patient is made to breath a little spray and a few drops of chloroform, the effect is magical, as also in asthma.

The apparatus is rather expensive; Charrière has some as dear as 80 francs, and 100 francs; but I would strongly advise all visitors to the "Exhibition" in passing the French court to ask for Charrière, and he will, if requested, set the apparatus at work; and I need not say oculis subjecta fidelibus, &c., how much more, satisfactory that is than mere description.

The chief surgeons in France are indeed now quite sanguine that the inhalation of this medicated "spray" has already worked such wonders in syphilitic diseases of the throat that tracheotomy in such affections will be entirely abolished. I am, Sir, &c.,

CHARLES KIDD, M.D.

Sackville street, June 21.

P.S.—The Medical Societies are closed, or I had intended to exhibit the apparatus at some of them, as I do not think it is as generally known as it deserves to be.

SINGULAR CASE OF LOSS OF HAIR.

SIR,—I beg to communicate the following singular and, I believe, unique case of the total and persistent loss of hair from the entire of the human body. I am, Sir, &c.,

R. M. FORSAYETH, M.D.

Templemore, June 17, 1862.

"J C., head gardener in the employment of John Carden, Esq

Barnane, about forty-eight years of age, spare, thin, of not very temperate habits, continually labouring under dyspepsia, loss of appetite, and uneasiness in the epigastric region, but otherwise healthy, and from the nature of his employment, of active habit. He was attacked about four months ago with sudden headache and general illness, towards evening with much sickness, pain and uneasiness at pit of stomach, so as to alarm his wife. He went to bed and got some hot drink, when feeling better he fell asleep, and awoke early in the morning well as usual, but on his wife turning round to look at him, she exclaimed, 'what has become of your hair!' He at once discovered that not a vestige of hair existed upon his head, face, or any other part of his body. Eyebrows, eyelashes, whiskers, beard, &c., all having shared alike the same fate, taking place during the brief space of five or six hours.

"The most extraordinary feature in this unique case is, that up to this day, now about four months, I cannot discover any tendency whatever towards the reproduction of the lost hair. The chief inconvenience which he labours under results from motes, &c., flying into his eyes, by reason of the absence of the eyelashes. It is also remarkable that all his former complaints disappeared instanter. Appetite now so keen, he must get food upon rising from bed; he also has gained flesh; his skin is softer, fairer, and fresher than before, and so much altered in appearance, for the better, that although I am acquainted with him for years, yet I did not immediately recognise him when first we met, after this unusual occurrence, upon the terrace at Barnane."—'Dublin Medical Press.

To the Right Honourable Lord Palmerston, M.P., and to Sir Robert Peel, M.P.

The Memorial of the Medical Officers of Dispensaries and Workhouses in the Counties of Sligo and Leitrim,

SHEWETH,—That the application of Medical science to the promotion of the public health, and the prevention and Medical treatment of disease, being an object of national importance, and a public duty of continued toil, responsibility, and peril to the Medical Officers, your Memorialists, therefore, submit these and other grounds in support of their claim to be included in any Bill to be brought before Parliament for the superannuation pensions of Poor-law Medical Officers.

The long course of Medical education and examinations in Medical science and practice required by law to qualify Medical Officers for their special public duties, and also to aid the Crown in criminal prosecutions, and the public and corporate bodies in many matters of Medical, police, and sanitary science, give them claims superior to those of any other officers in the public service for adequate salaries and superannuation pensions from the State; for no other public officers have such onerous, responsible, and dangerous duties to discharge—liable to be called upon every day, Sunday not excepted, at all hours, by night and day, and so exposed to all weathers and forms of contagion, regardless of their own health, that their lives may be said to be a continual sacrifice to their public duties. The Medical Officer of a dispensary cannot calculate upon one hour of his own time—all seems pre-engaged by the very nature of his public duties, which are rigidly exacted by prescribed rules.

Your Memorialists pray that the same amount of public justice that is being afforded by superannuation pensions to assistant barristers, to petty sessions clerks, to county surveyors, and to the Medical Officers of county prisons and lunatic asylums, may be extended to the Medical Officers of dispensaries and workhouses in Ireland. Neither of these officials so provided for by law are required to devote their whole time to the duties of their respective offices; while the Officers of the Poor-law Medical Department are the only class which the State has hitherto neglected to protect by superannuation pensions in return for their immense physical and mental sacrifices, many of whom become disabled by long service, and, in consequence, are liable to be superseded—superannuated without pensions.

Your Memorialists, therefore, pray that, as the salaries of the Poor-law Medical Officers in England are paid in half from the Consolidated Fund, that superannuation pensions be paid from that source to the few Medical Officers in Ireland who may survive twenty years such severe service, their premature mortality being greater than that in the most unhealthy dependencies of the British Crown. (See report by Drs. Stokes and Cusack, 1848.) In the year of famine-fever, 1847, one-fifteenth of the Medical men were cut off by that epidemic, and their lives were refused insurance, except on very hazardous premiums. Your Memorialists respectfully urge the vital interests of the Medical life guards of the nation, and pray that their claims may receive your favourable consideration.

(Signed by)

ROBERT LYNN, A.B., M.B., F.R.C.S.I., Physician, Sligo Gaol and Sligo Dispensary, Chairman.

TRAVERS HOMAN, M.D., F.R.C.S.I., Medical Officer, Sligo Workhouse, Physician, Co. Sligo Fever Hospital.

W. R. HAMILTON, M.D., M.R.C.S. Eng., Medical Officer, Carney Dispensary, Co. Sligo.

THOMAS DAVIS, M.D., M.R.C.S. Eng., Lurganboy Dispensary, Co. Leitrim, and Medical Officer, Manorhamilton Workhouse.

EVONY CARMICHAEL, L.R.C.S.I., Medical Officer, Cliffony Dispensary, Co. Sligo.

THOMAS MURRAY, L.R.C.S.I., Medical Officer, Manorhamilton Dispensary, Co. Leitrim.

JOSEPH LOUGHEED, M.D., M.R.C.S. Eng., Medical Officer, Ballymote Dispensary, Co. Sligo.

THOMAS BURROWS, M.D., L.R.C.S.E., Medical Officer, Riverstown Dispensary, Co. Sligo.

SAMUEL MCNUNN, L.R.C.S.I., Medical Officer, Gurteen Dispensary, Co. Sligo.

THOMAS M. NASH, M.D., L.R.C.S.I., Medical Offier, Drunkeeran Dispensary, Co. Leitrim.

HENRY THOMPSON, L.R.C.S.I., Medical Officer, Dromahair Dispensary, Co. Leitrim.

JAMES MCMUNN, M.D., Medical Officer, Dromore West Workhouse and Dispensary, Co. Sligo.

ROBERT MCMUNN, M.D., Medical Officer, Skreen Dispensary, Co. Sligo.

JAMES D. VERNON, M.D., M.R.C.S. Eng. Medical Officer, Tubercurry Workhouse and Dispensary, Co. Sligo.

OWEN MCMANUS, M.R.C.S. Eng. L.S.A. Medical Officer, Coolang Dispensary.

JAMES TUCKER, M.D., M.R.C.S. Eng. Medical Officer, Sligo Dispensary, Secretary.

At a meeting of the Medical Officers of dispensaries and workhouses of the counties of Sligo and Antrim, held in Sligo 21st June, 1862, Dr. Lynn in the chair (Dr. Tucker, Secretary), it was proposed by Dr. Davis (Manorhamilton), and seconded by Dr. Lougheed (Ballymote)—"That the Memorial now read by Dr. Tucker, our secretary, be adopted, and that copies of it be be addressed to Lord Palmerston and to Sir Robert Peel, as the expression of our united sentiments."

Births, Marriages, and Deaths.

BIRTHS.

ATWOOD.—On the 11th ult., at Clarendon road, Notting hill, the wife of W. A. Atwood, Esq., M.R.C.S., of a daughter.

BUBB.—On the 13th ult., at Welwyn, Herts, the wife of H. Warner Bubb, M.D., of a daughter.

SEABROOK.—On the 18th ult., the wife of T. Seabrook, M.D., of Brompton, Kent, of a daughter.

SMITH.—On the 17th ult., at Upper Belgrave place, the wife of H. M. Duncan Smith, M.D., of a son.

THOMAS.—On the 20th ult., at St. Clear's, Carmarthenshire, the wife of John Little Thomas, Esq., M.R.C.S., of a son.

MARRIAGES.

ADAMS—HALLAM.—On the 18th ult., at Stoke-next-Guildford, Henry Adams, L.R.C.P.E., to Louisa Stott, daughter of Samuel Hallam, Esq., M.R.C.S.

DURHAM—ELLIS.—On the 18th ult., at the Church of St. Stephen-the-Martyr, Marylebone, Arthur Edward Durham, Esq., F.R.C.S., of Brook street, Grosvenor square, and of Trinity square, Southwark, Assistant-Surgeon to Guy's Hospital, to Mary, youngest daughter of William Ellis, Esq., of Lancaster terrace, Regent's park.

GRAY—LEWIS.—On the 24th ult., at Glasgow, Alexander C. Gray, M.D., of Goswell road, London, to Mary, daughter of W. Lewis, Esq., of Glasgow.

DEATHS.

ADAMS.—On the 18th ult., John Adams, of Uttoxeter, Staffordshire, formerly of the Potteries.

BLIGH.—On the 2nd ult., at the Vicarage, Riccall, Yorkshire, Robert Bligh, L.S.A., Lond., aged 62.

DARLING.—On the 13th ult., at Russell square, Jane, daughter of George Darling, M.D., lately deceased.

DAWSON.—On the 15th ult., at Wray Castle, Windermere, Margaret, the wife of James Dawson, Esq., Surgeon.

JESSOP.—On the 21st ult., at 4 Royal crescent, Cheltenham, Walter Jessop, M.R.C.S., Eng., Surgeon to the Cheltenham General Hospital and Dispensary, Cheltenham Dispensary for Diseases of Women and Children, and Cheltenham Ophthalmic Hospital, aged 34.

MACRAE.—On the 23rd ult., at 3 Edwardes place, Kensington, Alexander Macrae, M.D. Univ. King's College, Abern., L.R.C.S. Edin., Surgeon (January 26, 1858) to H.M.'s 97th Regiment of Foot, aged 34.

MAXWELL.—May 8, at Happy Hut, Metcalfe, Jamaica, James Maxwell, M.D., late of Evandale, aged 67.

MCSWINEY.—On the 16th ult., at Charlotte quay, Cork, Valentine McSwiney, M.D. Univ. Edin., L.R.C.S. Edin., of Macroom, co. Cork, aged 55.

MEDICAL NEWS.

Royal College of Physicians of London.—At the Comitia Majora held on the 25th ult., the following gentlemen having undergone the necessary examination, were duly admitted Members of the College:—Philipson, George Hare, M.B., Newcastle-on-Tyne; Taylor, John, M.D., Queen's-road, Bayswater; Willis, Francis, M.B., Braceborough, Stamford;—At this Comitia the following officers were elected for the ensuing year:—*Censors:* Dr. Budd, Dr. A. Farre, Dr., Birkett, and Dr. Monro. *Treasurer:* Dr. Alderson. *Registrar:* Dr. Pitman.

Apothecaries' Hall.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on the 19th inst.:—Anthonisz, James Edmund, Colombo, Ceylon; Badcock, Lewis Carter, Crescent-place, Camberwell-grove; Browne, George, Colchester; King, Thomas, Guy's Hospital; Mahon, George Annesly Derville, Aspley Woburn, Beds; Nelson Samuel, Acomb, near York; Robson, Matthew James, North Shields; Shapland, John Dee, Oakford, North Molton; The following gentlemen also on the same day passed their first examination:—Hayden, William George, Charing-cross Hospital; Jones, William, St. Bartholomew's Hospital.

University of M'Gill College, Montreal.—At a meeting of Convocation, held on May 6th, twenty-three gentlemen received the degree of M.D., C.M. The number included the following graduates, the subject of the Inaugural Dissertation being attached to each name:—Charles Richard Nicolls, Montreal, Surgeon-Major, Grenadeir Guards: "On Rheumatic Fever." John Edward Moffat, Montreal, Staff-Surgeon, Guards: "On Gout." Henry G. H. Lawrence, Montreal, Assistant-Surgeon, Grenadier Guards: "On Typhoid Fever." Arthur G. Elkington, Montreal, Assistant-Surgeon, Scotch Fusilier Guards: "On Pneumonia." Edward Louis Lundy, Montreal, Staff Assistant-Surgeon: "On Syphilis." St. John Killery, Montreal, Staff Assistant-Surgeon: "On Idiopathic Tetanus." Robert Atkinson, Montreal, Staff Assistant-Surgeon: "On Diseases of the Liver." Thomas B. P.O'Brien, Montreal, Staff Assistant-Surgeon: "On Rheumatism."

Queen's University, Ireland, June 25th.—The degree of doctor in Medicine was conferred, at the close of the recent yearly examinations upon thirteen *alumni* of the above University. Of these, two were students in Belfast College, four were from Cork, and seven from Galway.

The Minister of Public Instruction in Italy.—The name of Matteucci is familiar to all scientific men, and we have ourselves given publicity to the Professor's labours in this journal. Matteucci has lately been appointed Minister of Public Instruction, and enlightened must be that Government which places men of learning and experience at the head of such an important department. The Minister is at the present time on a tour through the kingdom of Italy, in order to examine the workings of Schools and Universities.

Testimonial.—On the 18th ult. a handsome clock was presented to Dr. Whitehead, on his resignation of the office of assistant-surgeon to the Kent County Ophthalmic Hospital.

Appointments.—The Board of Medical Studies of the University of Cambridge has nominated Dr. John W. Goodwyn, Physician to the Suffolk General Hospital, Bury St. Edmund's, to be one of the Examiners for Medical Degrees during the academical year commencing October next.—Mr. Herbert F. H. Barham has been appointed Resident Medical Officer to the Kent County Ophthalmic Hospital.—Dr. C. Corbett Blades, of Church row, Kennington, has been appointed by the Drapers' Company Medical Attendant to the inmates of their almshouses, Cross street, Kennington, and Chapter terrace, Walworth.—Dr. Charles P. Ingram, Assistant-Physician to the City of London Hospital for Diseases of the Chest, has been appointed Assistant-Physician to the Hospital for Sick Children, Great Ormond street.—Dr. George T. Jones is President Elect of the North Wales Branch of the British Medical Association, in succession to Mr. Thomas T. Griffith, and not to Dr. Richard L. Williams; the latter gentleman was President in 1851.—Dr. Thomas S. Gray has been elected Surgeon to the Middle District of the Royal Infirmary and Dispensary, Dundee.—Mr. Owen Tucker has been appointed Surgeon to the Bath Lying-in Charity.—Mr. George G. Bothwell has been appointed Resident Medical Officer to the Guildford and West Surrey Dispensary.—Dr. Arthur B. Harris has been elected Surgeon to the Royal Cornwall Sailors' Home, Falmouth.—Dr. Alex. C. Tweedie has been elected Parochial Medical Officer for Galashiels, Selkirkshire.—Mr. Alex. Dyson has been elected Medical Officer for the new workhouse, Deanhouse, Huddersfield.—Dr. Richard Cox has been elected Medical Officer and Public Vaccinator for Districts Nos. 1 and 6, and the workhouse, of the Bradford Union, Berks.—Dr. Henry Dodgson, whose term of office has just expired, has been re-elected Medical Officer for the Cockermouth Union, Cumberland.—Dr. J. M. Hyslop has been appointed to act as Secretary to the Principal Inspector-General, Medical Department, Bombay, during the absence on leave of Surgeon W. C. Coles, M.D., or until further orders; and Mr. W. E. Wood, Assistant-Surgeon of the Bombay Medical Establishment, has been appointed Civil Surgeon at Baghdad, in succession to Dr. Hyslop.—Mr. Robert M. Mann has been elected Medical Officer and Public Vaccinator for the Deansgate District of the Manchester Union, vice Mr. Wm. B. Scott, resigned; and for the London road District of the same union, vice Mr. Robert H. M'Keand, resigned.—The District of the Worcester Union, lately held by Mr. J. Greening, was, after his death, divided into two parts: Dr. W. Woodward has been appointed to that part of it which now forms No. 1; and Mr. J. D. Jeffery to that part now called District No. 2, and to the workhouse. Dr. Woodward has also been appointed Vaccinator for the Parishes of St. Nicholas and St. Martin, and the Tything of Whistones.—Francis Paul Palmer, M.R.C.S. Eng., L.S.A. Lond., has been reappointed one of the Medical Officers for the Walsall Union, Staffordshire.—Frederick Theed, F.R.C.S. Eng., L.S.A. Lond., having now undertaken the whole of the Medical duties to the Rhyl Convalescent Institution, it is not intended to appoint a Physician in the place of Dr. Williams, lately deceased.—George Hughes Whymper, M.R.C.S. Eng., L.S.A. Lond., has been reappointed one of the Medical Officers for the Walsall Union, Staffordshire.

Rokitansky and the Vienna School.—For the last twenty-five years has Professor Rokitansky thrown brilliancy upon the Vienna school, by his well-kown pathological investigations. It would appear that the dead-house attached to the general hospital was quite inadequate to the Professor's labours; but, undismayed by this circumstance, Rokitansky has continued for many years to pursue his valuable researches. Government at last perceived that some improvement in the building just alluded to was imperatively called for, and a very appropriate house was ordered to be constructed. On the 25th ult., this was inaugurated with great pomp, Rokitansky being, of course, the cynosure of the ceremony. The subject of his speech was "Liberty in scientific researches." The Professor has lost none of his powers, and bids fair to render, for a long time to come, valuable services to Medical science.

Royal College of Surgeons.—The Council of this institution have just issued the following as the subjects for the Jacksonion Prize of the ensuing year, 1863, viz.:—"The Pathology and Treatment of Diseases of the Larynx; the diagnostic indications to include the appearances as seen in the living person. The dissertation to be illustrated by drawings and preparations." And "The Normal and Pathological Anatomy of the various Synovial Bursæ connected with the Muscles and Tendons of the Upper extremity, and the treatment of their diseases. The dissertation to be illustrated by preparations and drawings." For the present year, 1862, there are also two prize subjects, viz.:—"The Relative Value of the Treatment of Popliteal Aneurism by Ligature and by Compression; illustrated by a reference to cases." And "The Healthy and Morbid Anatomy of the Tonsils and the appropriate treatment of their diseases; illustrated by preparations and drawings." The Collegial Triennial Prize to be awarded in 1865 is on "The Structural Anatomy and Physiology of the Lymphatic Vessels and Glands (the anatomical distribution not being required); the communications (if any) between the lymphatics and the blood-vessels to be demonstrated; and the influence (if any) which the lymphatic vessels or glands exercise on the fluid they transmit, to be elucidated. The dissertation to be illustrated by preparations and drawings."

The Cholera at Mauritius and the French Medical Practitioners at Reunion.—A very interesting and even affecting correspondence is published in 'L'Union Médicale' between the Medical men of the French Island Réunion and the authorities of Mauritius. It would appear that at the time the cholera was raging in the latter island, the practitioners of Réunion wrote in a body to the authorities of the colony to offer the services of as many of them as would be required to go and assist their English brethren. The disease, however, declined rapidly, and the authorities answered the generous offer in a very appropriate manner, thanking the Medical gentlemen of Réunion, and announcing to them that, although touched by their willingness to assist the authorities, they were, owing to the mitigation of the epidemic, able to cope with the disease.

West Coast of Africa.—A Sickly Season.—Bonny.—Since the departure of the April mail this river and New Calabar have been visited with the worst attack of yellow fever known on the coast for the last thirty-six years. Out of a population of 140 whites 75 have been carried away within the month. The bark *Phrenologist*, in New Calabar, lost master, mate, carpenter, boatswain, and two seamen in two days. Hardly one of those who have been attacked has recovered. The sickness may be partly attributed to the long prevalence of easterly winds which blow directly across the swamps. Among the natives the mortality has been still greater, scores dying daily. As many as twenty corpses have been taken out of one house in a single day. Among those falling victims to this disease are Captain Joseph Thomson, agent to Messrs. Horsfall and Son; and Mr. Michael Hearn, agent to Messrs. Tyson and Richmond, two of the most influential traders on the coast. Trade, owing to the sickness, was almost stopped. The ship *Grand Bonny*, from Bonny for Liverpool, had been spoken. Four of her crew were dead.

Benin.—The river was very unhealthy, and trade almost suspended owing to disturbances among the natives. Rains were setting in. On March 18 Captain Frazer, of the ship *Rattler*, died; on the 25th, Captain M'Kay, agent for Messrs. Harrison and Co., died; and on April 8, Captain Granville, of the *Sunshine*, died. Fernando Po.—Trade was dull. On May 3 Mr. E. G. De Cardona died.

Consanguineous Marriages.—The following summary, as presented n Professor Morris's report in the 'American Medical Times' conveys a kind of practical instruction which every family physician should feel it his duty to enforce by professional counsel.

Class of Relationship.	No. of Families	No. of Children	Perfect	Defective
1. First Cousins	630	2911	955	1956
2. Second Cousins	120	626	360	266

A Tale of Horror.—Mr.——, we'll call him Mr. Vellum, of Melbourne, is blest with the friendship of Mr——, we shall call him Mr. Stockwhip, whose cattle station is not a hundred miles from Echuca. Stock-

whip is in the habit of sending, down tongues, potted butter, rolled beef, and fifty other up-country niceties to his town friend as presents. On Tuesday there arrived at Vellum's office a good-sized keg, the address-card in the well-known handwriting. It was late in the afternoon, just about time to start for Paradise Villa, South Yarra: the gift was safely stored in the buggy, and off Vellum started with the treasure. While tea was getting ready the keg was opened. 'How heavy it is!' says one. 'What on earth can he have sent this time?' says another. Speculation was not allayed when the lid was prised open and only dry salt presented to view. 'Dive deeper,' was the order of Pater Familias. The salt was carefully removed, and with considerable difficulty something bulky was dragged out, of indefinite shape and texture. 'Perhaps it's a Murray cod,' said one of the juveniles. 'Seems to be some preparation of pork,' remarked Vellum; 'however, let's have some fried for tea, and see how it eats.' Fried a couple of slices were; everybody tasted, but nobody liked it, it was so horribly tough. 'Perhaps we don't know how to cook it properly; suppose we try it to-morrow for breakfast,' Stewed it was, and certainly it tasted a little more savoury, but still tough. The proper mode of cooking had evidently not yet been hit upon; a piece was ordered to be boiled for dinner, and Vellum started for the day's business in Chancery-lane. There was the usual pile of letters to open, but one in Stockwhip's handwriting had the preference, and here it is:—'Dear ——, the scourge has reached us at last. Two of my finest bullocks were found dead in the paddock yesterday morning, and on being opened the indication of pneuro-pneumonia were unmistakeable. The left lung of one of them Dr.——here says is the most perfect specimen of diseased structure he ever saw. I want Dr. Macadam and Mr Miseamble to see it, and therefore I send it——to you——packed——in —salt.' Vellum's eyes began to swim. He did not dine at home that day.—'Geelong Advertiser.'

PARLIAMENTARY.—In the House of Commons, on June 20, Mr. Torrens inquired of the Secretary of State for India as to the truth of the alleged failure of the opium crop in India, and its probable effect on the revenue in that country. Sir Charles Wood said that he had received no official information. He had, however, reason to believe that there had been some failure in the opium crop, but it by no means followed that there would be a loss of revenue, because the sale of a smaller quantity at a higher price might produce as good a revenue as that of a larger quantity at a lower rate. Mr. Hennessy inquired of the Under Secretary for Foreign Affairs whether the murderer of Dr. M'Carthy at Pisa had been brought to justice, and, if so, with what result. Mr. Layard said that the murderer of Dr. M'Carthy was brought to trial on March 10, and sentenced to ten years' confinement, and to pay an indemnity to the family of the deceased. He went on to state that, although some people might take exception to the punishment as too lenient, it was according to the Tuscan code, by which the punishment of death was abolished; and, as the imprisonment was accompanied by solitude and silence, although the murderer was a very hale man, there was scarcely a chance of his surviving his punishment.

ALLEGED POISONING.—An inquiry took place on the 23rd ult. into the cause of death of Mrs. Frances Phillips, the wife of Mr. H. R. Phillips, horse-dealer, of Albert terrace, Knightsbridge. The relatives of the deceased accused the husband of having poisoned her, and her mother stated that previous to her death the deceased had told her that her husband had "Palmered" her. The body was exhumed by order of the Coroner. A post-mortem examination was made by Dr. Edwards, and a chemical analysis by Dr. Harley of University College. No trace of poison was discovered, and evidence was adduced which entirely exculpated Mr. Phillips. The jury returned a verdict, "That the deceased had died from natural causes, and that not the slightest blame was attached to her husband."

APPOINTMENTS FOR THE WEEK.

Wednesday, July 2.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopædic Hospital, 2 p.m.

METROPOLITAN ASSOCIATION OF MEDICAL OFFICERS OF HEALTH.—Election of Officers. 4 p.m.

OBSTETRICAL SOCIETY OF LONDON.—Dr. M'Clintock (Dublin), "Clinical Report on Turning in Cases of Disproportion."—Also papers by Dr. Harley, Dr. Braxton Hicks, and Dr. Tilbury Fox. 8 p.m.

Thursday, July 3.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

LONDON SURGICAL HOME.—*Operations:* 2 p.m. Ruptured Perineum; Ovariotomy.

Friday, July 4.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, July 5.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital, 2 p.m.

Monday, July 7.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1¼ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, July 8.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—Professor Gulliver, "On the Blood of the Vertebrata." 4 p.m.

BOOKS RECEIVED FOR REVIEW.

On the Strength and Beauty of Mineral Teeth. By Edwin Truman, Esq. M.R.C.S. London: John Churchill.

Parturition without Pain. By James Townley, Esq., L.R.C.P. Edin., F.R.C.S.E., &c. London: J. W. Davies, 54 Princes street, Leicester square.

The Mammary Signs of Pregnancy, and of recent Delivery. By J. Lumley Earle, M.D. London: J. W. Davies.

On the Treatment of Gonorrhœa without Specifics. By J. G. Milton, Esq. (Second Edition.) London: J. W. Davies.

Prolapsus, Fistula in Ano, and Hæmorrhoidal Affections: their Pathology and Treatment. By T. J. Ashton, Esq. London: John Churchill, New Burlington street.

NOTICES TO CORRESPONDENTS.

*** The next part of Dr. Churchill's articles on Consumption, will appear in our next number.

CORONERS' COURTS.

To the Editor of the Medical Circular.

SIR,—I apprehend that the pupose for which Coroners' Courts are maintained is to compare all the evidence which can be brought forward with regard to the mode of death of the subject of the inquiry, and from such evidence, if possible, to arrive at correct conclusions thereupon.

Whether a lawyer or a medical man is the more fitted to preside over such a court, I think the following case which I witnessed a few years since will show.

A man after leaving a warm bath, suddenly staggered and fell, blood flowing copiously from his mouth and nostrils, and he died as the medical practitioner who had been summoned arrived.

An inquest and post-mortem were ordered, and Mr. —was entrusted with performing the latter, predicting meanwhile, that the man had died through *rupture of the aorta.* Upon removing the sternum and opening the pericardium, there indeed was a clear opening in the aorta *made by the same stroke of the scalpel that opened the pericardium,* and at the inquest this was given in evidence as the cause of death. It was not however explained how a communication existed between the aorta within the pericardium and the mouth.

The real cause of death must have been rupture of one of the large pulmonary vessels, the patient being almost in the last stage of phthisis; nevertheless, the coroner concurred in the finding of the legal jury, which was strictly in accordance with the medical evidence.

This case speaks for itself; the medical is nearly always the most important evidence in a coroner's inquest, and how much more careful would medical men be in giving it before a man versed in their own art. The consequences in the present instance were trivial, but what might they have been if a mistake similar in character were made in a case where an accused or suspected party is involved?

I am sure, Sir, your readers will not think that I have sent this letter to expose professional neglect, for such a case as this is a rare one, and will, perhaps, scarcely be credited.—I, am, Sir &c.,

June 23, 1862. STUDENS.

NIL ADMIRARI has called our attention to a paper on Mesmerism which appears in a recent number of the 'British Medical Journal,' and comments on the inconsistency of an editor attacking homœopathy and giving encouragement to the equally stupid fallacies of mesmerism. Nil Admirari goes on to say, "does the aforesaid editor hold two balances—one for one order of quackery and another for another, or has he really no balance at all?"

F.R.C.S.—Mr. Turner, of Manchester, is a most worthy man. His hospitality on the occasion of the British Medical Association Meeting at Manchester will not be soon forgotten. He is quite worthy of a seat at the Council.

CHIRURGUS.—Dr. Lankester for the Central District, and Dr. Mushet for the Western, are the two candidates that should be supported. We have already announced that Dr. Ross has withdrawn.

J. H.—On "Pumps" received.

Dr. G.—We do not believe that smoking a noxious weed like tobacco can be innocent to health. There is a certain amount of a most intensely-poisonous oil extricated—burnt, if you please—in the act of smoking, and who shall say that even if not swallowed, this poison does not injuriously affect the fauces and system generally? We know some hard smokers, men who smoke in earnest, unmistakable tobacco through a pipe, and they all have dull, cadaverous countenances, rotten teeth, spongy gums, with a liability to abscesses—in short, they are an unhealthy lot of humanity.

Mr. EARLE is thanked.

Mr. WILSON.—Note received, and shall be attended to.

Dr. PHILLIPS.—Copies forwarded. We are unable to give the information required.

NEGO's note on the "Laryngoscope" received. The objection is unimportant.

Dr. HUNT.—1st. No.—2nd. No.

AMICUS.—Chloroform has not, we believe, diminished the rate of mortality after operations, but there are more recoveries, because there are more operations. In those cases, such as hernia, where the ratio of recovery is increased, the improvement is owing to a better method of treatment rather than to choloroform.

Dr. TUCKER.—Received and inserted.

AN OLD SUBSCRIBER.—The fee varies from one to two gnineas a day. In your case the demand should be made for the latter sum in both instances.

Dr. TILT.—Received.

D. YOUNG.—Note received.

F.R.C.S.E. is thanked.

HOSPITAL OF THE SCHOOL OF MEDICINE.

(PROFESSOR NELATON'S WARDS.)

Treatment of Morbus Coxæ.

Mr. Nélaton concluded his course for the winter session by a few lectures on morbus coxæ, a disease common in childhood and youth; the management of the affection is better understood since the publications of Bonnet of Lyons, on the subject, and deserves all the attention of surgeons.

Five paramount indications must be met—viz.:

1. To relieve the affection of the joint in which the mischief has originated.

2. To prevent the deviations and displacements consequent on the arthropathy.

3. To rectify such deviations or displacements, two distinct things, when in the absence or in spite of all previous treatment, they have been induced.

4. To remove complications.

5. To restore the movement of the joint after protracted immobility.

The first indication requires general measures appropriate to the removal of the predominant diathesis, and a local treatment in which the leeching and cupping, formerly so popular, are now replaced by tincture of iodine and the actual cautery. We seldom have to deal with the early stages of coxalgia. When surgeons are consulted, local or general bloodletting are very seldom expedient. Pomades and liniments are scarcely more profitable, but, being innocuous, may be resorted to. The reiterated application of tincture of iodine over the diseased joint is a method possessed of positive efficacy. The parts should be painted over every day for five or six days in succession, until the epidermis peels off. The operation may then be discontinued, and again reverted to when the skin has healed. This remedy is one from which, according to Mr. Nélaton, beneficial results may be expected; but, when it has failed, the Professor resorts neither to blisters, which are painful and of doubtful efficacy, nor to moxas, but has at once recourse to the actual cautery.

The olive-shaped cautery, at white heat, is the best. During anæsthetic sleep, nine or ten longitudinal eschars should be established in the vicinity of the trochanter major. The lines should be drawn at intervals of an inch, and a metallic ruler will be found useful and convenient for the purpose. This appliance secures the safety, promptness, and depth of the cauterisation, and spares the patient unnecessary suffering. The most distressing consequence of the operation is not the necessarily deep scarification produced by contact with the heated iron, but the inefficient and superficial burns in the second and third degrees, inflicted by the radiation of heat. Cauterisation, thus performed, is a most powerful remedial agent, especially in relapses of a local inflammatory character. Although a patient may be progressing favourably, he may catch cold from accidental exposure, and the joint again become painful; as the fruits of persevering treatment would be imperilled, cauterisation is then appropriate. If the other measures, which we shall presently enumerate, fail in restoring the previously satisfactory condition of the part, in the course of six weeks or two months the actual cautery should again be applied. Shorter intervals are unnecessary, because in the human subject, as in the horse, the operation produces slowly its full effects, and sufficient time should be allowed for their manifestation. Two months should, therefore, be permitted to elapse between the first cauterisation and the second, and three months between the second and the third.

In a former number (ART. 5986), we have explained the method of dotted cauterisation, Mr. J. Guérin exclusively resorts to in arthralgia, and which this eminent practitioner describes as highly beneficial. Professor Nélaton opines, however, that it is not sufficiently powerful, and seldom has recourse to it except in the mildest and most recent cases of morbus coxæ.

The first duty of the practitioner in this disease, is to arrest its further progress, by placing the joint in perfect immobility; by so doing another highly-important indication is also satisfied—namely, the deviation of the hip and the consequent displacement of the bones are prevented. For this purpose Bonnet's apparatus may be used, which fixes the lumbar region of the body, the pelvis, and lower extremities, leaving the region of the sacrum and anus uncovered. This contrivance entirely prevents all movement in the articulation, but does not perfectly adapt itself to the small of the back. So long as the pain lasts, the patient remains in the groove, which is the most sedative of all applications. This apparatus is, however, expensive; a cheap and efficient substitute will be found in the appliance imagined by M. Guersant, a description and figure of which we supplied in a former number (ART. 5951.) Whatever system be adopted, the limb should lie in a parallel direction with the healthy leg, or, to speak more accurately, with the axis of the body. Mr. Malgaigne alters this principle, and recommends the thigh to be placed in exaggerated abduction, as the tendency to adduction, the most unfavourable of all the displacements to which the hip-joint is liable, is almost unconquerable.

Let us now suppose the deviation to have taken place; it must be rectified, and here Bonnet's precepts may be usefully applied. This practitioner displayed in cases of the kind an extraordinary amount of temerity. No difficulties could quail his courage; he would fearlessly destroy all attachments, and resorted, if necessary, to the most violent procedures to restore the femur to its place. After the exhibition of anæsthetics, he would firmly grasp the thigh, the pelvis being fixed on a padded board, and in one operation, which seldom lasted less than a quarter or half an hour, he would cause the bone to execute the most extensive movements. Bonnet was an athletic personage, of an earnest disposition, and perfectly convinced of the soundness of his doctrines—hence the great energy of his proceedings in the delicate circumstances alluded to. If the muscular resistance was unconquerable, he unhesitatingly resorted to the knife, and frequently divided the tendons of the adductor muscles.

Mr. Nélaton acknowledges that these manipulations inspired him with some dismay. This treatment was instituted in many cases, both in hospital and in private practice, during Mr. Bonnet's short residence in Paris, and in several a cure was effected without accident. But in other instances, particularly at the Hospital of the School of Medicine, untoward results were observed. A convalescent child, in whom spontaneous dislocation had been induced by morbus coxarius, was placed under Bonnet's care, and underwent the treatment we have described; deep-seated abscesses followed, sinuses formed, and death was the consequence. In another patient the adductor muscles were divided, extravasation of blood took place, and the case likewise ended fatally from the effects of putrid decomposition. Bonnet, it is true, declared that in his opinion, the abscesses existed in a latent state previously to his intervention; but this was mere equivocation, an evasive answer by no means acceptable to reflecting minds.

The practice of this eminent Surgeon is, therefore, in some respects objectionable, and even perilous; but yet it is not entirely destitute of real advantages, and may even confer benefits of so important a character, that it would be unwise to reject it altogether. In this, as in other matters, it is proper to separate what may be useful in the method from what is obviously injurious. We must condemn tenotomy performed on deep-seated muscular structures; these are not the only obstacles in the way of reduction; the resistance, against which the section of tendons is powerless, is often produced by adhesion of the articular surfaces to each other, or to the adjacent parts. We must, moreover, denounce efforts calculated to produce dangerous lacerations; but we entirely approve of the principle of moderate traction, and communicated movements; the knife should, in our opinion, never be resorted to.

These remarks apply to cases which are not of very long

standing, in which deviations and displacements coexist with the last embers of articular inflammation. But in cases of remote origin, which have induced lamentable deformity, if the patient is in other respects healthy and vigorous, something more may legitimately be attempted.

Mr. Nélaton related, in illustration, a very interesting case which occurred in his own practice, shortly after Bonnet had exhibited his daring procedures before the Paris surgeons. A young lady, a foreigner, aged eighteen, of brilliant health and complexion, had been six years before affected with morbus coxæ; she had recovered, but the disease had caused a contraction of the thigh so considerable that the limb was in contact with the abdomen. The dorsal region, at the same time, had sunk in to that degree, that when the patient reclined on her back, a man's head might without exaggeration have been passed under her. She had consulted all the surgeons in Europe, and repaired to Paris, fully determined to undergo the most painful operations, if any hope could be held out of relieving her of an infirmity of so cruel a character. Mr. Nélaton carefully examined the parts during anæsthesia, and ascertained that the movements in the joint were so obscure and limited, as to be equivalent to almost entire immobility. But, encouraged by the robust health of the young patient on the one hand, and on the other by her determination to seek relief at all hazards, he boldly persevered in his efforts at rectification. Several attempts were made to effect this purpose, the pelvis being securely fixed by assistants, but without any result. Mechanical appliances were then resorted to. The patient was laid on a well-padded orthopædic bed, and secured on this solid couch by a wide belt which surrounded the chest and abdomen, and prevented any displacement of the pelvis. The fulcrum of counter-extension was taken at the axillæ. A system of pulleys was then applied to the knee by means of a knee-cap bearing appropriate hooks. The operator then grasping the femur, moved it like a winch-handle to effect the laceration of the adventitious ligamentous bands, which intimately connected the head of the bone with the capsule; but even with this enormous power, the attachments remained firm after six operations.

Mr. Nélaton, in his despair, entertained a hope that the neck of the femur might perhaps give way, and considered this as the most advantageous object he could achieve in so difficult a case. A final attempt was therefore made. The circumstances were momentous in the highest degree; a strange, fearful sound was heard in the hip-joint, the limb spontaneously stretched itself out, and fracture of the neck of the femur was supposed to have taken place. An appropriate apparatus had been beforehand prepared in the expectation of this contingency. The patient was laid in Bonnet's groove, and was treated up to the fortieth day as if fracture had really occurred. Gentle movements were then daily communicated to the extremity, in order to promote the formation of a false joint, and the patient progressed in so unexpectedly favourable a manner, that, in this singular case, Mr. Nélaton still remains in doubt whether fracture and subsequent pseudarthrosis, were really induced.

Indeed, palpation never distinctly revealed the presence of a false joint, and one thing alone remains evident—viz., the perfectly satisfactory effects of the operation; the young lady now goes into society, dances and rides, and no trace whatever remains of her former condition, beyond an unimportant irregularity in the standing attitude. When both feet are placed on the same line, the figure slightly bends forward; but this ceases as soon as the foot on the diseased side is instinctively advanced two or three inches.

The above is an illustration of what surgery may effect for the rectification of limbs contracted in the highest degree. If in this case the bone was not fractured, the accident has been observed in the reduction of dislocations of long standing of the shoulder and elbow, and yet the patients have recovered without difficulty. The contingency is not to be dreaded when abone like the olecranon constitutes an absolute impediment to reduction. In the knee, sudden rectification might occasion injury to the nerves and blood-vessels, but lacerations of this description are not to be apprehended in the case of the hip-joint, and for this reason Mr. Nélaton was justified in venturing upon the bold measures which proved so brilliantly successful in the instance we have recorded.

We deem it unnecessary to reproduce the Professor's remarks on rectification by gradual and protracted extension. This procedure has been tested in succession by Humbert (of Morley) and Pravaz (of Lyons), and children have been placed, without the slightest benefit, for fifteen and eighteen months in the orthopedic apparatuses imagined by these gentlemen.

We now turn to the fourth indication in the treatment of morbus coxarius—*i. e.*, the management of complications, amongst which we must notice pain and abscesses. We are aware that the pain subsides as soon as the limb has been placed in a state of perfect immobility; the abscesses should be opened with the trochar, and injections of tincture of iodine should be thrown in. After two or three injections, their capacity decreases, and the cavity sometimes closes altogether. In some cases, a sinus remains, the evacuation of the contents is partial only, and Mr. Chassaignac's elastic fenestrated tubes may be resorted to with advantage. If the puriform secretion is supplied by osteitis, it may be proper to inquire into the expediency of excision of the hip-joint.

Our readers are not unacquainted with the fact that this very question was the starting-point of the recent debates on hospital hygiène at the Academy of Medicine. It appeared singular that an operation frequently successful in England, should always entail fatal results in France, and the failure, and consequent unpopularity of the procedure were imputed to the deficiencies existing in our nosocomial institutions. We cannot, of course, presume to foretell what Mr. Nélaton will think of excision of the hip-joint on his return from London, where he has been summoned as a member of the Jury of the International Exhibition; but before his departure from Paris, he showed but little partiality for the operation. In support of his unfavourable view of the procedure, he adduced the large number of instances in which persons afflicted with caries and sinuses recover with the aid of time. He also alluded to the perils of excision. It is easy, said he, to remove the neck of the femur, but it is far more difficult to apply the gouge and rasp to the acetabulum, without considerable risk to the patient. Mr. Nélaton, therefore, very much doubts the accuracy of the statistics which have been brought forward, and cannot believe that the proportion of cures can really, as has been stated, be more than half of the cases of operation.

To conclude our remarks on the treatment of morbus coxæ, we must now advert to the fifth indication—viz., the re-establishment of the movements of the joint.

The question of spontaneous movements, and the time during which immobility of the joint must be enforced, is one of great practical difficulty, increased by the fact that dislocation of the femur not unfrequently happens at the very time, when a cure of the disease of the joint seems to have been effected. More than once Mr. Nélaton has been deceived by these apparent cures; he permitted the patients to take walking exercise, and the head of the femur soon was displaced from the articular cavity. It is, therefore prudent, in order to confirm the good results already obtained, and yet allow the subjects to take an amount of exercise necessary for their health, and for the re-establishment of the action of the joint, to prescribe the use of crutches, sticks, or of any other contrivance calculated to support the weight of the body, and prevent dangerous pressure on the acetabulum. We may perhaps be enabled to present our readers in an early issue with the engraving of a very ingenious apparatus, to be seen at the Exhibition in Mr. Mathieu's stall, which is well calculated to answer the purpose.

Communicated movements may be also imparted; but before venturing on these or on spontaneous motion, it is indispensable previously to ascertain that the arthritis has entirely yielded; a knowledge to be acquired, as Mr. Malgaigne has shown (Art. 6225) by pressure at the back of the trochanter.

It is, however, impossible to state with precision to what extent motion is recoverable,—seven, eight, ten or twelve years may be necessary for its restoration. In many instances, it can never completely return, and ankylosis of the straightened limb is the utmost art can effect. Mr. Nélaton, however, does not altogether share in Mr. Malgaigne's discouraging conviction, that Bonnet's belief in the recovery of the functions

of the joint, is a delusion. Mr. Nélaton is acquainted with several young women, who in their infancy suffered more or less from morbus coxæ, and in whom daily progress may be observed in the re-establishment of the mobility of the articulation.

Finally, after having lasted a variable time, coxalgia is cured, the movements of the limb are restored entirely or in part, but *talipes equinus* remains in a slight degree. The surgeon is solicited to divide the tendo Achillis, but Mr. Nélaton conceives that he should decline interference, the lowering of the point of the foot being a necessity which disappears spontaneously after a little time.

ART. 6243.

AURAL SURGERY.

Remarks on Injections into the Middle Ear.

Scarcely was Eustachian catheterism introduced into practice, when the possibility and expediency of conveying, by means of this operation, into the middle ear, simple or medicated fluids and gases of various nature, became a subject of discussion.

At the beginning of the last century, the scientific world was startled by an important discovery.

An obscure and previously unknown person, a common post-master, who was completely deaf, and had in vain sought relief from empirics, impelled by a desire of curing himself, endeavoured to master the complicated anatomy of the ear.

He acquired the needful information from an attentive study of Duvernoy's work, and a careful inspection of his valuable engravings, illustrative of the structure of the organs of hearing, and at last succeeded with a lead catheter in reaching the Eustachian tube through the mouth; he then adapted a syringe, filled with tepid water, to the orifice of the metallic appliance, and injected the liquid. In a few days he was cured; after the third operation, he suddenly recovered his hearing as perfectly as he had ever possessed it.

This discovery was soon confirmed by further experience; its importance at once became obvious, and it has now assumed a prominent place in the history of surgical science.

This is an unquestionable instance of the cure of deafness by the injection of tepid water into the Eustachian passage; it is recorded at full length in the minutes of the Academy of Sciences for the year 1724, and the *Arsenal de Chirurgie* of Garengeot, which was published at the same period, further supplies us with a description and diagram of the instrument.

This remarkable case was at first received with slender confidence; the post-master, however, found many imitators, but, to say the truth, the results were of the most disheartening nature.

The theorists of the day, expatiated, of course, on the perils of the introduction of a foreign body like water, by means of a coarse contrivance into delicate structures, invested with mysterious functions, and containing naught but what was termed innate air.

These erroneous but plausible objections exercised the most fatal influence on the new and valuable discovery, and sinking beneath the shafts of well directed ridicule, it fell into the deepest and most undeserved oblivion.

Now that the violent prejudices, brought to bear against the method imagined by the deaf post-master, have long been dispelled, the important inquiries it suggests may be dispassionately entered into.

A few words in explanation: we all are aware that the mucous secretions of the nasal fossæ are capable of acquiring extreme consistency, and of adhering to the Schneiderian membrane with a degree of tenacity which can be conquered only by injections of tepid water.

The lining membrane of the Eustachian passages is but the reflection of the mucous structures of the pharynx and nares, and inflammatory action is readily propagated from the latter to the former. The secretion, whatever its abundance, undergoes in all similar changes, and may entirely obstruct the tubes. Now the diameter of the Eustachian channel being at its most contracted part—*i.e.*, at the junction of the cartilaginous with the osseous segment, but the fourth part of a line, a small amount of dessicated, hard, and adhesive mucus will readily occasion temporary obliteration of this small cavity, and promptly induce complete deafness.

This was certainly the case in the instance of Guyot, the post-master above alluded to, who first succeeded in injecting tepid water into the middle ear. Deafness is not, however, the result of one efficient cause only, and the same treatment applied in all varieties of cophosis, cannot be expected to prove always triumphant.

The truth of this remark soon became evident; but as the causes of the different kinds of deafness are now perfectly well-known, and point to the rational and methodical management of each, the objection falls to the ground.

These discouraging failures were not, however, entirely destitute of utility, and led to the discovery of several new modes of introduction of medicated fluids into the middle ear, when the injections of pure water had fruitlessly been resorted to.

Valsalva, Busson, and Munnichs had already conceived the idea of prescribing the inhalation of the vapours of odoriferous flowers, such as those of melilot, marsh-trefoil, &c., and causing them to pass into the Eustachian tube, during forced expiration, the nose and mouth being closed.

The notion of using medicated air in the treatment of deafness, is also to be found in Haller's writings. He mentions a surgeon who was in the habit of recommending the inspiration of hydromel-vapours with benefit. Somewhat later, in 1792, Herpold, of Copenhagen, proposed the substitution of common air for the various injections in use at the period, and he would appear to have met with a surprising degree of success.

It is an unquestionable fact that the injection of air promptly deobstructs the Eustachian passages and the drum, when these cavities are filled with inspissated mucus. This secretion adheres to the fenestræ and ossicula, interferes with the regular performance of their functions, causes hardness of hearing and tinnitus, and if from its viscidity the internal orifice of the tube becomes agglutinated, entire deafness must promptly follow. In cases of this kind it must be acknowledged that a small quantity of air, cautiously injected, will break through the thickened but yet liquid secretion, divide the mass, and separating its particles, at once restore the freedom of the passage, and the temporarily interrupted action of the organs.

The patient in such cases rapidly, in general instantaneously, recovers his hearing, in the same manner as the perception of light is at once re-established in the blind after the removal of cataract.

These singularly fortunate cases are, however, unfrequent, at least, as far as the ear is concerned; the surgeon has more usually to deal with organic causes which, by slow operation, have destroyed hearing. The result cannot therefore be expected to have always the same characters of promptness and decision.

Chronic inflammation of the middle ear and of the Eustachian tube, is one of the most common and obstinate of the diseases which occur in practice, and in this affection the mucous membrane is always more or less thickened.

Itard was the first who described the disease with the care it deserves, and he displayed his usual acumen in the delineation. He soon, however, discovered that in this instance, the chronic morbid changes of the mucous membranes did not yield to the injection of water, and still less to the air-douche; but that sulphurous douches were beneficial and also resinous, or aromatic injections, or even vapours of ether when a nervous condition distinctly co-existed.

Such was the state of the question when Marc-D'Espine published his researches on diseases of the ear, and again demonstrated the utility of the injection of solutions appropriate to the peculiarities of each case. Thus the diluted solution of potash, of nux vomica, strychnia, and vératria, were found unquestionably beneficial in several obstinate and predetermined morbid conditions.

I have myself recorded many instances illustrative of their efficacy. *(a)*

Daily experience has since confirmed these results in the most positive manner. *(b)*

Here lies the entire secret of the treatment. To attempt to remove the manifold causes of deafness by one procedure (such as the air-douche, for instance), is a system which can lead to no result but disappointment, and must eventually bring medicine into discredit. It is only by careful examination and accurate diagnosis of the disease the surgeon has to deal with, that he can hope to institute measures of treatment calculated to do good, in those cases at least which are not beyond the reach of Medical art, and are yet susceptible of improvement, or even of recovery.

I may add, in conclusion, that very few diseases of the ear are entirely local.

Gout, rheumatism, syphilis, and, above all, scrofula, perpetually baffle the most ingenious and well-directed efforts of the surgeon, who resorts only to local measures. These important complications must, therefore, always be borne in mind, and I may say that in the course of my personal experience, I have met with many instances of deafness which yielded to an appropriate and persevering general medication.

Certain mineral waters will also be found extremely beneficial in peculiar cases. TRIQUET, M.D.

ON THE PROXIMATE CAUSE OF CONSUMPTION AND ITS SPECIFIC TREATMENT BY THE HYPOPHOSPHITES.

By J. FRANCIS CHURCHILL, M.D. (Paris).

No. XI.

REPORTS OF CASES TREATED SUCCESSFULLY IN THE THIRD STAGE (THAT OF EXCAVATION). (c)

CASE XIX.—PHTHISIS IN THE THIRD STAGE.

Previous duration.—Four years.

Symptoms.—Emaciation; debility; shortness of breath; cough; expectoration; fever; night-sweats; sleeplessness; loss of appetite; vomiting; diarrhœa.

Lesion.—Cavity at the apex of left lung; softened tubercles over its anterior aspect and at its posterior apex; tubercles at apex of right lung.

Result of Treatment.—Disappearance of general symptoms of stethoscopic signs of right side, and of signs of softening on left side; persistence of signs of cavity.

Duration of Treatment.—Five months.

Lieutenant-Colonel K., a native of England. Disease not hereditary; began four years ago. Patient then made several long sea-voyages, remained some time in New Zealand, and improved somewhat while there. But towards the close of 1859, all the symptoms grew much worse, and diarrhœa set in for the first time. Recourse was had to cod-liver oil and to steel, which had relieved him when first attacked, but now failed to arrest the progress of the disease. After much pressing, his physician consented to prescribe the hypophosphites; but, whether they were improperly administered (the physician thinking them of no value, and merely prescribing them to satisfy his patient), or whether the preparations employed were impure, they also were productive of no benefit. Meanwhile, as the patient kept getting worse, he was induced by hearing of several cases which I had treated with success, to come to Paris and put himself under my care in April, 1860. He was then in the following condition:—Considerable emaciation, which has made great progress, especially of late; strength much reduced; dyspnœa so distressing that he can hardly ascend to the first-floor; cough very frequent and troublesome, particularly towards night, becoming incessant when the patient happens to be in a room where many persons are assembled. He is consequently unable to dine at a table d'hôte, or to go to a reading-room. Expectoration muco-purulent and nummular, about one-fourth of a tumblerful daily. Fever towards evening, and occasional night-sweats; sleeps badly, and has no appetite; vomits at times; no hæmoptysis; has been troubled with diarrhœa for the last two months.

Local signs.—Expansion of the ribs imperfect on the left side. On percussion, in front, dulness above the left clavicle, and below it for three fingers' breadth; diminished resonance in the rest of that side. On the right, dulness above the clavicle, as well as below it for three fingers' breadth. On auscultation above the left clavicle, cavernous respiration with abundant gurglings during cough; perfect pectoriloquy; same signs below the left clavicle and throughout the whole extent of the dulness; below, down to base, moist rattles of varying size and intensity. In the upper third of right lung, large moist crepitation and bronchophony. Behind, during inspiration, the left shoulder rises less than the right. On percussion, diminished resonance at the apex of left lung. On auscultation, moist crepitation in the left fossa supra-spinata; increased resonance of voice in the fossa supra-spinata and the upper part of the intrascapula region. Diminution of the respiratary murmur in the rest of this side. On the right, exaggerated respiration.

Diagnosis.—Cavity at the apex of left lung; softened tubercles in the remainder of its front aspect and its posterior apex; softened tubercles at apex of right lung. The rapidly-increasing aggravation of the general symptoms, the digestive complications, and the great extent of the local lesions, rendered my prognosis of this case most unfavourable. Nevertheless, under the influence of the specific treatment, methodically employed, all the general symptoms rapidly improved. The diarrhœa disappeared, appetite returned, the fever and night sweats ceased, sleep returned, the intensity of the cough considerably diminished, and in six weeks the patient was already in a very satisfactory state. On ausculation, the left lung still presented the signs of excavation, but the rattles at the base had disappeared. On the right there were the same moist crepitations, but they were less distinct, and much less numerous. In three months and a half, though the improvement was much interfered with by the cold damp summer of 1860, the specific treatment gradually dispelled all the general symptoms, and in August of the same year I considered the patient cured. He then left Paris for a tour in Germany, and then returned to England. His state then was as follows:—He had gained flesh, and weighed six pounds more than before. He had no cough, except very slightly in the morning to expectorate three or four small muco-purulent sputa floating in a limpid salivary fluid. He had no dyspnœa, and his respiration was so easy that he was able to walk long distances. He visited all the public monuments without fatigue, and, as he told me, even went up to the top of the triumphial arch without being so much out of breath as several friends who accompanied him. There was no fever nor night sweats. He slept well, his appetite was good; No vomiting, and the diarrhœa had entirely disappeared; in short, his general health was perfect.

Local signs.—Inspiratory expansion of left side, still imperfect. Percussion dulness the same as at first on left side, but diminished on the right. On the left side cavernous blowing without gurglings; perfect pectoriloquy; fine dry clicking during cough, no rattles nor crepitations. On the right, below the clavicle, increased vocal resonance, but no rhonchi. Behind, percussion and auscultation normal on both sides.

I have since seen this patient twice, when passing through Paris. He was still quite well, had passed the autumn in England, and frequently gone out shooting. I saw him again in May, 1861. He had passed the winter well, had grown quite stout, and was never better. The left side still presented the same signs of excavation. On the right, respiration was quite normal. I had the opportunity of examining this patient in May last, and noted as follows:—

General health perfectly good; a little cough and expectoration in the morning only. On the right side, percussion and respiration, cough, and voice quite normal. On the left side, dulness on percussion, cavernous blowing and pectoriloquy above the clavicle, but no *râles*, even during cough. Below the clavicle dulness on percussion for a finger's breadth, with blowing respiration and bronchophony. In rest of lung, respiration normal.

The above signs indicate a gradual contraction of the cavity of the left lung, and a permanent restoration of the right to its natural condition.

CASE XX.—PHTHISIS IN THE THIRD STAGE.

Previous duration.—One year.

Symptoms.—Debility; emaciation; thoracic pains; difficulty in lying down; sleeplessness; night sweats; fever and rigors; dyspnœa; cough; expectoration; hoarseness; anorexia; dyspepsia; vomiting; occasional diarrhœa,

Lesion.—Cavity in the right lung, with softened tubercles in front.

Result of Treatment.—Disappearance of the general symptoms. Very great improvement of physical signs.

Duration of Treatment.—Four months.

Mr. N., æt. twenty-four, a native of England.

June, 1860.—Several of patient's relatives have suffered from chest diseases. Has always been in very delicate health. Pale complexion; his illness first came on about a year ago, but got much aggravated in March last. Has grown so weak that he can no longer ride on horseback, as he has always been accustomed to do. Considerable emaciation; complains of pain in the right side, and

(a) *Practical Treatise on Diseases of the Ear.*

(b) We shall take an early opportunity of supplying the formulas of these various injections.—H. C.

(c) Translated from the second edition of my work, 'De la Cause Immédiate de la Phthisie Pulmonaire.' In the Press.

cannot cannot lie on that side; sleeps badly, and sweats so profusely that he is obliged to change his linen every night. Fever and rigors in the evening; pulse 120; considerable dyspnœa; coughs a good deal; voice very weak; has had no hæmoptysis; has no appetite; digestion difficult; frequent vomitings. For a month past has been troubled with diarrhœa.

Local signs.—Thorax much emaciated; imperfect expansion of the right side. Dulness on percussion over the whole of right side; normal resonance on the left. On auscultation, on the right above the clavicle as well as below, for four fingers' breadth, cavernous respiration, with pectoriloquy; below, moist rattles down to base. On the left, exaggerated respiration especially at the apex; behind right shoulder rises less than the left. Percussion, dulness in the right fossæ infra-et supra-spinatæ; diminished resonance throughout the rest of this side. Bronchophony in the fossa supra-spinata, and in the intra-scapular region of right side; coarse respiration in the rest of the lung. On the left, normal respiration.

Diagnosis.—Cavity and softened tubercles in the front of right lung. The treatment of this patient lasted four months. Within the first fortnight there was a decided improvement of all the symptoms, which continued without interruption till September. He had then recovered his colour, his strength had returned to such an extent that he could ride on horseback as well as before his illness. He had grown stout; the thoracic pains had disappeared as well as the sleeplessness and night sweats; no fever nor rigors in the evening; no dyspnœa; appetite good; digestion easy; no vomiting; no diarrhœa; a very slight cough in the morning without expectoration.

Local signs.—Imperfect expansion of right side, and dulness on percussion. On auscultation on the right, the same cavernous respiration and pectoriloquy as before. A few dry cracklings during forced inspiration or coughing; the rhonchi at the base have disappeared. Behind, diminished resonance on the right side. On auscultation, the respiration of right side was considerably weaker than on the left, where it appeared perfectly normal. Though this patient was not definitively cured, as he was most anxious to return home, I did not oppose it, and he accordingly left Paris. I have heard from him since, and in January, 1861, he continued to enjoy good health.

Case XXI.—Phthisis in the Third Stage

The four following cases are from my first year's dispensary patients:—

Previous duration.—Seven months.

Symptoms.—Debility; fever; cough; expectoration; hæmoptysis; night-sweats; dyspnœa; loss of appetite.

Lesion.—Softened tubercles occupying the whole surface of the right lung before and behind; formation of an excavation during treatment.

Result of Treatment.—Improvement of the physical signs, and almost complete disappearance of the general symptoms; persistence of signs of excavation.

Duration of Treatment.—Nine months and a half.

Auguste F., æt. eighteen, unmarried, an architect.

Nov. 15, 1858.—Doubts as to disease being hereditary; habit of body eminently tuberculous; cheeks red; complexion clear; pearly conjunctiva. Says he has grown a great deal of late; has been ailing for seven months past; his strength diminished considerably at first, but has returned a little recently; has not lost much flesh, having always been of spare habit; has fever occasionally in the evening, but no rigors; cough frequent, especially in the morning; muco-purulent expectoration not very abundant; has vomited blood twice, the first time only a little, but the last time, on 26th September, he threw up a considerable quantity of clotted blood through the mouth and nose; the night-sweats, which were very abundant, especially after the hæmoptysis, have diminished within the last week; has no difficulty in lying down; sleeps well; dyspnœa moderate; moist tracheal râle audible at a distance; appetite capricious, does not vomit, and digests well; no colics or diarrhœa; one natural motion daily; has ceased attending to business for three months, but returned to it again on the 1st of June, but is obliged to remain in an office, and cannot go out; has taken cod-liver oil for five months; for a month past has been taking hypophosphite of soda. Pulse 144, regular.

Local signs.—In front, on percussion, dulness above the right clavicle, as well as below for about four fingers' breadth. On auscultation on the left side, below the clavicle, coarse respiration with jerking inspiration; on the right, above the clavicle, blowing respiration, with small gurglings greatly increased during cough, considerable resonance of voice; below the clavicle, numerous moist rattles, completely replacing the inspiratory sounds; imperfect pectoriloquy; same phenomena over the whole space corresponding to the dulness; the respiratory murmur is not perceptible higher than three fingers' breadth below the clavicle, and down to base it is mixed with moist rattles and dry crepitus; vocal resonance much increased; behind, on percussion, dulness in the right fossa supra-spinata and the whole corresponding intra-scapular region; diminished resonance in the fossa infra-spinata of the same side; on auscultation on the left, in the fossa supra-spinata, weak respiration; nothing abnormal in the rest of the lung; on the right, in the fossa supra-spinata, fine mucous rattles, almost completely replacing the respiratory sound, and increasing during cough bronchophony; the same phenomena in the fossa infra-spinata, in the intra-scapular region and throughout the whole extent of lung, except just at the base, where the respiratory murmur is very weak.

Diagnosis.—Softened tubercles throughout the whole extent of right lung, both before and behind. Probably crude tubercles at apex of left.

Treatment.—Hypophosphite of soda, gr. viij. daily.

November 22nd.—Patient is rather better; the night sweats have ceased; the fever is less. The appetite has improved, and the cough somewhat diminished. Pulse 130, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. xvj. daily.

November 29th.—Cough continues to diminish. The sweats returned during five or six nights, but ceased again last night; appetite remains the same; dyspnœa somewhat relieved; no fever; last night had slight epistaxis; pulse 130, regular, moderately full.

Treatment.—Hypophosphite of lime, gr. viij. daily.

December 6th.—Expectoration decreased; no sweats for the last two nights. Fever still comes on from time to time, but is less frequent and less intense; sometimes passes a day without any; appetite good; pulse 148.

Treatment.—Hypophosphite of lime, gr. xvj. daily.

December 15th.—Cough diminishes; strength remains the same; appetite continues good; the tracheal râle still audible at a distance; pulse 120, regular, moderately full.

December 29th.—No night-sweats nor fever; dyspnœa has decreased; he expectorated one bloody sputa some days ago; appetite good. Pulse 140, rather irregular and small.

Treatment.—Hypophosphite of soda, gr. viij. daily, after suspension for two days.

Jan 10th, 1859.—The fever and night sweats have not disappeared. The cough and expectoration are moderate.

Treatment.—Hypophosphite of soda, gr. viij. daily.

Same treatment after four days' suspension.

Jan. 28th.—Patient has sweated a little this week, with slight epistaxis. Pulse 120, regular, moderately full.

Treatment.—Cupping at the base of the thorax.

Feb. 11th.—Coughs very little, and in the morning only; has had night-sweats once during the week; pulse 140, rather irregular, and weak.

Local signs.—In front, on percussion, considerable dulness above the right clavicle, and below for a space of three fingers' breadth; still lower down, the resonance is pretty good, though less than on the opposite side. On auscultation on the left, one or two cracklings only after deep inspirations; no resonance of voice nor of cough; at the base, jerking respiration; on the right, above the clavicle, blowing respiration, with small gurglings; imperfect pectoriloquy; gurgling during cough; below the clavicle, very numerous fine cracklings; distant pectoriloquy; a little gurgling during cough; the same signs almost down to base, except the vocal resonance; behind, on percussion, dulness over the whole of right side. On auscultation in the left fossa supra-spinata, slightly increased vocal resonance, without râles or cracklings; respiration rather weak in the rest of the lung; on the right, in the fossa supra-spinata, fine crepitant rattles; prolonged expiration; the same phenomena in the upper part of the intra-scapular region and in the fossa infra-spinata down to the base.

Treatment.—Hypophosphite of soda, gr. viij. daily.

February 28th.—Patient scarcely coughs at all, and expectorates very little (about half a spoonful daily); has no night-sweats; strength and appetite good; slight dyspnœa; pulse still 112, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij. daily, after suspension for four days.

March 18th.—Very little cough; scarcely any expectoration; very slight dyspnœa; no night-sweats; appetite good; pulse 120.

Treatment.—Hypophosphite of soda, gr. viij. daily, after suspension for four days.

March 28th.—Improvement continues; now works eight hours a day, and can attend to out-door business; has not lost flesh; pulse 100, irregular. Same treatment.

April 20th.—Is going on well, and now complains of nothing but slight dyspnœa; pulse 120.

Same treatment, after suspension for four days.

May 20.—No night-sweats; strength good; hardly any cough, and very little dyspnœa, but for some days past her appetite has fallen off.

Treatment.—An emetic.

May 11th.—Appetite has returned; pulse 120.

Treatment.—Hypophosphite of soda, gr. viij. every other day.

May 30th.—Hardly any cough; says that he has grown since he began my treatment; epistaxis occurred the day before yesterday. No treatment.

July 15th.—Patient continues to improve, but the cough has slightly increased; he has had night-sweats and epistaxis; pulse 120, regular, and moderately full.

On examination the following was noted:—Very marked depression of the right side, with imperfect expiratory expansion. Anteriorly, on percussion, cracked pot sound above the right clavicle; below, dulness for a space of three fingers' breadth, with diminished resonance over the remainder of lung. On auscultation, above and below the left clavicle, rather coarse respiration; voice natural; no râles nor cracklings. On the right, above the clavicle, cavernous respiration; very numerous fine gurglings; perfect pectoriloquy; the same below, gurglings in upper three fourths; coarse and prolonged respiration in the lowest fourth. Posteriorly, dulness in the right fossa supra-spinata as well as in the fossa infra-spinata. On auscultation, on the left, in the fossa supra-spinata, a few cracklings, which increase during cough, and are then accompanied by a few sibilant rhonchi; respiration rather faint in the fossa infra-spinata. On the right, in the fossa supra-spinata, cavernous respiration, numerous fine gurglings, increasing during cough; perfect pectoriloquy. The same phenomena in the fossa infra-spinata and the intra-scapular region, except quite at the base.

℞. Solut aconite, gut. 120;
Syrup. simpl. ʒij.;

A teaspoonful each night.

Aug. 22nd.—Improvement maintained; good appetite; strength satisfactory; pulse 96, regular, moderately full.

Treatment.—Resume the hypophosphite, in doses of gr. viij. daily. This was the patient's last attendance at the dispensary, as he considered himself well, but in January, 1860, he was seen by one of my pupils, and was then following his ordinary avocations, the only symptom left was a little cough.

(To be continued.)

THE HISTORY OF THE LARYNGOSCOPE.

By JAMES YEARSLEY, Esq.,

Surgeon to the Metropolitan Ear Infirmary, Sackville street.

(Continued from page 11.)

Although I have no desire to say aught to discourage the attempts of any would-be laryngoscopist to achieve success in this new art of exploring the larynx, it is but right to prepare him for the difficulties which will at first beset him, in order that he may bring to the task the necessary amount of patience and perseverance by which alone he will surmount them. He must make up his mind that his first examinations will be unsatisfactory—he will obtain no positive results—his own awkwardness and want of tact and gentleness in adjusting the laryngeal mirror on the one hand, and the rebellious throat of his patient on the other, the opening of the mouth, the position of the tongue, the projection of the focal light on the proper spot, are so many obstacles to a first success. But be assured the attempt having been made is a step gained. Preparatory to a second examination, you instruct your patient to accustom his throat to the presence of foreign bodies, by which its sensitiveness will be greatly reduced.

Those only who, like myself, are engaged in treating throat affections, know what care, and preparation, and teaching, are sometimes necessary before we can venture on any local application to the highly sensitive mucous membrane in and about the larynx, the mere touch of which will sometimes produce an alarming spasm.

Nothing can be more frightfully exciting than one of these *contretemps* from sponging the larynx. You withdraw your instrument, and whilst you are wiping it, your patient rises from the chair; you turn round and you see her casting upon you a most anxious and imploring look for help, wringing her hands, and running here and there instinctively towards the window for more air, under the appalling sense of impending suffocation, and this would be her inevitable fate, if, in one minute, more or less, the spasm of the glottis did not subside. Coolness and freedom from any apparent apprehension on your part will accelerate this desideratum. By a confident manner and an encouraging word you contribute much to remove the alarm which your patient experiences, and this you do whilst meditating and preparing for a plunge of your trocar into the trachea, to save her from instant death. I have spoken of the patient as of the feminine gender, for in nine cases out of ten, such an accident occurs to women from the infinitely greater sensitive organisation of the larynx in them than in men. I am not aware that this fact has been noticed before, but such is undoubtedly the case. You may spend minutes in preaching and teaching a woman how to comport herself whilst you are in the act of sponging or brushing her throat, how she is for the moment to resist the act of breathing, and how well and successfully she can do so by forcing up and fixing the diaphragm; she will assure you she quite understands it, and is prepared; she opens her mouth, and the instant your brush or sponge touches the pharynx, up go the uvula and soft palate, and down goes the epiglottis; but this does not prevent you from completing your operation. The next moment may occur the scene I have attempted to pourtray. Not only is the larynx in women more sensitive than in man, but I believe also she has not the same power over the action of the diaphragm; at all events, it is difficult to teach her the mode of fixing that muscle pending the act of sponging the throat.

Dr. Turck recommends young beginners to commence their experiments upon the dead body; but dead bodies are not so easily met with, and therefore Stoerk proposes to study the larynx of dogs, pigs, or sheep. Dr. Czermak's experience is greatly in favour of auto-laryngoscopy; and, by the surprising experiments he makes upon himself, he has amply demonstrated the feasibility of the practice.

For this purpose he has devised a special apparatus, consisting of a concave mirror perforated in the centre, for the advantage of an observer. The strong light of a moderator lamp is thrown upon the mirror, and the concentrated rays are made to impinge upon the back part of the mouth of the person who is examining himself. By the aid of a quadrangular piece of glass between himself and the illuminating mirror, he can see all that the observer can see who is looking through the central opening of the latter; but, to make this operation more clear to the reader, I will give a wood-cut of the apparatus in my next paper.

BIBLIOGRAPHY.

The subject of Laryngoscopy being new, the literature bearing upon it is, of course, very limited, and, therefore, easily traced. A very contributed nothing towards it; and it is only so recently as March 27, 1858, that we find the first special article "On the Laryngeal Mirror" in the 'Gazette Hebdomedaire de Vienne,' from the pen of Dr. Czermak. The subject was followed up by the same author on April 17th in the same journal. In the same year, May 28th, his friend and pupil, Dr. Semeleder communicated a paper at the sitting of Physicians at Vienna, "On the Employment of the Laryngeal Mirror in the Diagnosis and Treatment of Diseases of the Tongue."

On June 28th, Dr. Turck published his first article in the 'Zeitschrift der Geselltschaft der Aerzte zu Wien.' On December 20th, Dr. Stoerk sent to the same journal an account of two pathological cases in illustration of the value of the laryngo-pharyngeal mirror. About the same time Dr. Neudoerfer described a new canula for laryngotomy, to explore the larynx and trachea by the aid of a speculum introduced through the wound. These are all the communications which appeared in 1858.

In 1859, Czermak opened the year with a communication in the 'Gazette Hebdomedaire de Vienne,' January 8th, "relative to the surprising discovery of a small polypus situated upon the right vocal cord in an individual affected with hoarseness, said to be 'nervous.'"

In February, we find him publishing, in the Hungarian language, 'Researches on Laryngoscopy, with engravings on wood, and illustrated by seven Pathological Cases.' In the same month, Dr. Turck sent an article to the 'Zeitschrift der Geselltschaft der Aertze zu Wien,' "Upon an art in the examination of the Larynx," and in March he also communicated to the Society of Physicians of Vienna, a series of pathological observations, seven in number, and made with the aid of the laryngoscope. In April also was commenced in the 'Allgemeine Wienar Medizinische Zeitung,' a series of papers 'On the Laryngo-pharyngeal Mirror, and its Employment in Diseases of the Larynx and neighbouring parts.' In the 'Weiner Med. Wochenschrift' of April 16, and following numbers, will be found Dr. Czermak's second article, entitled 'Researches in Laryngoscopy.' In the same year also appeared communications by Dr. Gerhardt, of Tubingen, by Drs. Semeleder, and Stoerk, all bearing testimony to the value of laryngoscopy, but the race for fame, as has been seen in this new art, has been mainly between Drs. Czermak and Turck, both being most zealous and indefatigable in the cause.

Dr. Czermak's memoir, entitled 'On the Laryngoscope and its Employment in Physiology and Medicine,' originally published in German, has been translated into French, and from the French into English for the Sydenham Society, by Dr. George D. Gibb, to which translation I am indebted for much of the information to be found in these papers. The occasional notices which have appeared in the French and English journals, have been but mere items of news, or scraps of translations supplied by German correspondents, but by the recent visit of Dr. Czermak to this country a stimulus has been given to the subject, and now whatever there be of value in this new method of investigation will be eliminated in the inquiry set on foot by that gentleman, or, on the other hand, of exaggeration, will be as surely softened down into sober truth.

(To be continued.)

The Todd Memorial.—The labours of the sub-committee entrusted with carrying out the wishes of the subscribers to the Todd Memorial, have now terminated. In the vestibule of King's College Hospital is erected a full-length marble statue of Dr. Todd, by Mr. Noble. The ceremony of uncovering the statue took place at a meeting convened for that purpose on Thursday, July 3. In addition there has been established an annual prize for Clinical Medicine, which is to bear the name of the Todd Prize. It is to consist of a large bronze medal, by Wyon, bearing a profile of Dr. Todd on the obverse and the College arms on the reverse, with a suitable inscription, together with a prize of books of the value of 3*l.* 3s.

HOSPITAL REPORTS.

ST. GEORGE'S HOSPITAL.

SERO-CYSTIC TUMOUR OF THE ANKLE, CLOSE TO THE JOINT—REMOVAL.—MR. PRESCOTT HEWITT.

When tumours make their appearance in the vicinity of important joints, the necessity of early removal is clearly indicated, because in the early stage of development there is less risk of opening the synovial membrane during the operation, and also because the increasing size of the tumour will make the destruction of the joint probable, unless early removal be resorted to. The following case is one of those in which this rule was followed with a very satisfactory result:

The patient, a labourer, fifty years of age, was admitted into St. George's Hospital on the 21st May last, under the care of Mr. Prescott Hewitt, in consequence of a small tumour on the inner side of the left ankle joint, just over the malleolus. It did not exceed the size of a walnut, but had gone on steadily increasing since he had first noticed it, eight months previous. He could assign no cause for its appearance, as he had never worn tight boots or received any injury to the part.

The tumour was circumscribed, firm, and hard, but not osseous in texture. It was perfectly moveable under the skin, and not in any way connected with the bone. It was not painful to the touch, but caused the patient considerable inconvenience in walking.

On the 29th of May, Mr. Hewitt made a longitudinal incision over the tumour, and dissected it out. It was connected to the periostum in one part, but it was carefully removed without injury to this membrane.

The tumour was found to be composed of a number of small cysts, connected together and freely communicating with each other. The cysts contained a thick, cheesy matter, and had little bodies growing in them. They were of the tubero-cystic kind.

The man made a very quick recovery, and was discharged on the 14th of June, perfectly cured.

ST. MARY'S.

MALIGNANT DEGENERATION OF THE LOWER EXTREMITY OF THE FEMUR—AMPUTATION OF THE THIGH—RECOVERY.—MR. URE.

When malignant disease attacks persons far advanced in life, it becomes a matter for serious consideration, whether or not, the patient's life can be prolonged by a capital operation. The question will generally be decided in reference to constitutional powers manifested by the patient; but even in estimating the chances where they seem in favour of the patient, great judgment on the part of the surgeon, is necessary to enable him to form a correct estimate of them. The case under consideration is an interesting example of a successful capital operation of the severest class, in a man who had arrived at the prescribed limits of human existence—the patient being in his seventieth year.

He was admitted into St. Mary's Hospital on the 31st of January last under the care of Mr. Ure, in consequence of an enlargement of the right knee, attended with a considerable amount of pain.

The history he gave of his case was, that about twelve months previously he had sustained a fracture of the femur just above the condyles. The fracture had apparently united perfectly, and he was able to walk about, but with a slight lameness. The limb was much smaller than its fellow, never having been fully developed, and presented a shrunken appearance, which he said had been the case for the last fifty years. Some months after, the knee became swollen and painful, preventing him from using it in walking. He then applied for admission into the hospital, when the knee was found considerably enlarged, and measured four inches in circumference more than the left. There was little or no motion in the joint; the chief seat of pain was at the outer side of the patella, where there was an elastic condition resembling fluctuation.

On the 7th of February chloroform was administered, and the actual cautery was applied over the spot above mentioned.

On the 9th he complained of a shooting pain most severe at night, for which Dover's powder was prescribed; his appetite continued good. On the 21st suppuration was established, and the pain was somewhat moderated, although he could not bear pressure on the outer side of the patella. The pain, however, soon became worse, and distressed him much, both by day and night; his general health gave way in consequence, when it was thought advisable to remove the limb. To this he readily assented, and on the 19th of March Mr. Ure performed amputation through the lower third of the thigh by the circular method. Two vessels only required ligature, and very little blood was lost, although the bone appeared more vascular than natural. After the patient was removed to the ward, he was in a very low state, and was consequently ordered half an ounce of brandy every hour.

On examining the knee-joint of the removed limb, the extremity of the femur was found much enlarged, being in a state of cancerous degeneration, with the formation of cysts; there was a deep cavity just above the condyles, where the bone had been removed by the ulcerative process. The line of union of the fracture was distinctly visible. The cartilages were all in a state of ulceration at different points. On the day after the operation, the patient was reported to have passed a good night; the pulse tranquil; the tongue natural; was ordered wine and brandy at suitable intervals.

On the 21st, complains of nausea; the stump, however, looks healthy; ordered four minims of prussic acid, in an ounce of water every four hours.

On the 24th was much better, and had taken some broth, which he appeared to relish; was ordered four ounces of port wine, and two ounces of brandy daily. On the 24th, there was a slight discharge from the wound.

By the 7th of April, he was considered convalescent; the wound was nearly united, and the stump was well formed.

On the 14th, he was up and dressed; the stump was quite healed; general health good.

The patient left the hospital cured, and six weeks after was seen by Mr. Ure, when he was walking on an artificial leg, the stump being well covered with soft tissues. The case was, consequently, very satisfactory.

ETHNOLOGICAL SOCIETY.—At the meeting of the Society on the 1st inst., John Crawfurd, Esq., F.R.S., President, in the chair, a paper was read by Professor Huxley, F.R.S., on the "Human Remains Found in the Shell Moulds of the Malay Peninsula." In consequence of the illness of Professor Huxley, an abstract only of the paper was read, in which the author regretted that the fragmentary nature of the evidencies precluded him from offering any opinion as to the probable race to which they belonged. Observations were made on the relics by Dr. James Hunt, Mr. John Evans, F.S.A., and the President. The next paper was by Mr. Mackie, "On Some Human Remains from the Valley of the Trent and from Weardale." The principal facts which Mr. Mackie laid before the Society have been already published in the 'Medical Times and Gazette.' He called especial attention to the Muskham skull, and pointed out the abnormal characters of the occipital foramen, and with respect to the Heathery Burn relics, confidently assigned to them an antiquity of at least 200 years B.C. The discussion supervening on the paper was opened by Mr. Carter Blake, who dilated at length on the characters of the race of men whose remains had been found at Muskham, Borris, Blackwater, Sennen, Heathery Burn, and Anglesey, remarking that so far as we were cognizant of genuine British skulls, they were very unlike the majority of skulls of the present day. *Bos primigenius*, or his direct representative, had not been previously demonstrated to have been contemporary with man; and although several other instances had been lately adduced by antiquaries, they at present lack scientific corroboration. The evidences at Muskham, however, could not be inferred to be those of the aboriginal population of the British islands; the latter were possibly the men who left the chipped flints at various localities. Of the osseous and cranial character of these races we are ignorant,—a fact which teaches us the futility of negative evidence in geology. Dr. Knox congratulated the Society on the discovery of so valuable an assemblage of facts, and said that if we had had the cervical vertebræ belonging to the Muskham skeleton, we should have been warranted in assuming that it was a distinct species of man. He had advocated during many years the theory of the common derivation of animals from one origin, and still considered the development of the human race as subject to the operation of ordinary zoological laws, the exact mode of operation of which was hitherto undemonstrated. Sir John Bowring, Mr. Pringle, Mr. Wright, F.S.A., Mr. R. S. Poole, Mr. Burke, Mr. J. Evans, F.S.A., Dr. Hunt, and the President, joined in the discussion. Mr. Bailey read a paper "On the Veddahs of Ceylon," illustrated with beautiful photographs of their skulls. Papers were also read by Mr. Clarke, "On some Drawings from Sierra Leone;" Dr. Knox, "An Inquiry into the Influence of Climate and of Hybridity over Man;" and by Dr. Julius Schvarcz., F.G.S., of Stuhlweissenburg, "On the Permanence of Type." The Society formally adjourned till November.

JUNIOR MEDICAL SOCIETY OF LONDON.—At a meeting of this Society, held at Westminster Hospital on the 1st inst., C. Heath, Esq., Vice-President, in the chair, the following pathological specimens were exhibited:—"Fractured Pelvis," by Mr. Gandy (Westminster). "Fibroid Tumour recurrent after Amputation at the Shoulder-joint," by Mr. Hatherly (Westminster). "Mr. Holt's Dilator, and a Specimen of Stricture after Operation," by Mr. Clarke (Westminster). "Cancer of the Neck, involving the Trachea and Œsophagus," by Mr. Heath. The same gentleman exhibited a boy suffering from spurious anchylosis of the jaw, caused by the contraction on the right side of cicatrices, consequent upon sloughing after scarlet fever. Dr. Mark B. Tanner read a paper upon "Uterine Hæmorrhages, especially with regard to Placenta Prævia and its Treatment." After a lengthy discussion, the meeting was adjourned to October 21.

FLOATING SANITARIUM.—The "Bentinck" is now stationed as a floating hospital at the mouth of the Hidgelee river, Bengal. The situation is, perhaps, the best that could be selected, its occupants having all the benefits to be derived from the ocean breezes.

DEATH FROM CHLOROFORM.—On Monday, the 23rd ult., an inquest was held on Mrs. Susan Harrison, whose death was occasioned by chloroform, administered at the Bath United Hospital to facilitate an operation for the removal of a tumour. From a post-mortem examination, it appeared that the deceased suffered from fatty degeneration of the heart.

MUNIFICENT BEQUEST.—The late James Shaw Taylor, Esq., has bequeathed 2,000*l.* to the Huddersfield Infirmary.

THE MEDICAL CIRCULAR.

WEDNESDAY, JULY 9, 1862.

THE CORONERSHIPS.

At the moment of our writing (Mondsy) the contest in the Central District is carried on with extreme vigour on both sides. During the early part of the day all the published lists have given the majority to Mr. Lewis; but we hope that, at the close of the poll, a different result will be declared. It is very desirable that a Medical man should be Coroner for the Central District. In the Western District, an active canvass is going on, and Dr. Mushet is doing his best to deserve the support of his brethren. The Profession should not suffer themselves to be misled as to the importance of the election in this District, which is the residentiary quarter of the *élite* of the Metropolis.

We are happy to be able to state that there is a general belief that Dr. Lankester has been elected, and that Dr. Lankester has addressed the electors in that sense. A scrutiny has been, however, demanded, the result of which will not be known until Wednesday.

THE COLLEGE OF SURGEONS AND THE MEDICAL COUNCIL.

The trial of strength between the College of Surgeons and the Medical Council, which many persons had been expecting, came off at the last session of the latter body, and the College of Surgeons claims the victory. The Scotch delegates, and a portion of the English delegates, took the side of the supremacy of the Council; on the other hand, the College was supported by its own representatives, the Irish delegates, and one or two other inconsiderable names. That the Scotch and Irish representatives should be in antagonism does not surprise us. There is an understood rivalry between these two sections of the Council, one of which thinks it fair to seize any fair or colourable pretext for humbling the other; the English interests, meanwhile, profiting by the contention. Like a wary old diplomatist, Mr. Green sits, with a philosophical serenity, in the chair, knowing that every division of opinion can be turned, when desirable, to the interests of his College. When the Irish section waxes hot Mr. Green smiles; when the Scotch exhibits the *perfervidum ingenium Scotorum*, Mr. Green smiles again: indeed, the English side is always smiling, as men generally do who win.

The bone of contention on the recent occasion was the alleged infringement of the regulations of the Medical Council by the College of Surgeons. The Medical Council required that a given period should be allotted to professional education, the commencement of which was explained to be the commencement of attendance upon lectures and hospital practice. The College of Surgeons ignored this regulation, and made one of their own, in which it was set forth that the commencement of Medical education shall be understood to be—"1. Attendance on the practice of an hospital, dispensary, or other public institution recognised by the College for that purpose. 2. Instruction as the pupil of a member of one of the Royal Colleges of Surgeons in the United Kingdom, or of the Faculty of the Physicians and Surgeons of Glasgow. (Attention being paid in either of these cases to Practical Pharmacy.) 3. Attendance at lectures on Anatomy, Physiology, Chemistry, or Natural Philosophy, by lecturers recognised by this College."

The gist of this regulation is, that the College recognises, as a portion of the period of Medical Education, the time a youth may expend with a Surgeon in learning the art of dispensing. Our readers will remember that, some time since, we pointed out the absolute necessity of some provision being made for the instruction in Pharmacy of those gentlemen who might register a College diploma only, and who might practise without further qualification. The evil was growing so rife as to have excited censorious remarks; and it was upon our appeal that the Council determined to issue the regulation which encouraged intending candidates for the College diploma to study Practical Pharmacy under the eye of a general practitioner.

With respect to the principle comprised in this regulation we give it our decided approval. There *must* be some regulation requiring a sufficient study of Pharmacy before registration. The Medical council ought to have issued a rule to that effect; it has, however, neglected to do so; and the College of Surgeons looking to its own credit and the efficiency of its members as practitioners, have published a regulation that to a limited extent meets the requirement. As practical men, they say, "we cannot suffer our members to enter upon the practice of medicine without some knowledge of pharmacy; we will, therefore, prescribe a rule which will tend to encourage the residence of a pupil with a general practitioner during the first year of the commencement of his Medical education." The Medical Council, on the contrary, have been so infatuated with the grand style of transacting business, and have had so much of their attention absorbed with the construction of classical and scientific curricula that they have not deigned to bestow a thought upon the humble functions of the dispenser, as if they were of no practical importance either to the registered practitioner or his patients. The annihilation of apprenticeship has made it, however, incumbent on the Medical Council to provide a substitute, so that the public shall have some guarantee that the candidates for their confidence who go forth armed with the Registrar's certificate, shall be competent to mix a black draught or compound a castor-oil mixture.

The course taken by the upholders of the dignity of the Council, against the insubordinate action of the College, was neither seemly nor discreet. The controversy had the aspect of a quarrel between rival colleges, rather than a contention as to which party should do best for the interests of the Profession and the public.

Do the Medical Council object to teaching in Pharmacy? We cannot believe it; they are neither so perverse nor so absurd? Then if they think that every general practitioner should be instructed in pharmacy, why do they not issue regulations in relation to it?

Instead of quarrelling with the English College of Surgeons, let them extend the period of study from four years to five, and require that either the first or the last year of it should be spent with some private practitioner or in a public institution, and that before registration, a certificate of such instruction should be produced to the Registrar. This would be a practical course. It would preserve their period of professional education, and at the same time meet the requirement of the College with reference to pharmacy.

The Medical Council should take the lead in all matters relating to professional education; and it could do so if it wisely considered all the conditions of the question, and made due provision for their fulfilment. If the College of Surgeons has inflicted a blow on the Council's moral force and repute, its humiliation is due to its own mistakes, and the College may fairly claim a victory, won by its superior sagacity, and practical resolution. It is because public opinion would decide that the College is in the right, and the Council in the wrong, that the College has succeeded; but the Council may reverse the award by bestowing proper attention to this subject, and issuing such regulations as its importance demands.

SUMMARY OF THE WEEK.

DEATHS FROM CHLOROFORM.

More deaths from chloroform! These melancholy recitals are coming upon us thicker than usual; but we are getting so accustomed to them, that they hardly excite our notice. Is it the fact, that annulling sensibility by chloroform, is in itself so perilous, that we must expect to hear occasionally of deaths from the operation? Still we ought to be able to diagnose the cases in which unusual danger may exist. This is the vocation of science. Grant the dangers; let us learn its signs and foreshadowings, that we may avoid the risk. After all that has been written upon this subject, nothing decisive has been attained; nothing that can be formulated into a rule for general observance. In America, ether is the favourite anæsthetic, and we are informed that death rarely, if ever, occurs from its employment. Is it not possible that we are wedded too much in this country to the use of chloroform? Would it not be better, at any rate, in all minor cases, to resort to ether rather than chloroform? Again, which is the better mode of administration—with Snow's inhaler, or with a towel or handkerchief? Authorities differ widely upon these points. Dr. Simpson has recently employed a single breadth of linen which he places over the mouth and nose of the patient, and on which he drops, *guttatim*, the chloroform. Care is taken that the lips and nose be previously oiled. This plan is said to save the chloroform, and to be unattended with danger. It seems highly probable, that when death results, it is caused less by the chloroform itself than by an injudicious or careless mode of administration, whereby asphyxia, or, if the reader pleases, apnœa, is caused. We know all that has been said about syncope, asphyxia, cardiac, paralysis, and so forth; but we still lack something definite, notwithstanding all the ingenuity of learned professors.

THE SPRAY-CURE.

When we first heard of the pulverisation of water, we were rather puzzled to understand the term; probably our readers were in the same predicament. Pulverisation means pumping water into spray—nothing more. Water used in this way may be impregnated with any medicinal substances: in fact, mineral waters have been so administered in Paris, and, *Trousseau teste*, with success. M. Trousseau is an eager advocate of this method of treatment, which is now becoming popular in Paris. The introducer of this practice is M. Sales-Girons, who has been indefatigable in pressing it upon professional notice. Recently, M. Poggiale has reported to the Academy upon it; but the discussion is postponed. It has been doubted whether the spray when inhaled, really reaches the air vesicles, or even the bronchial tubes; but we cannot see any substantial reason to doubt this. We know that persons engaged in mechanical operations in which a quantity of fine dust is liberated, inhale the dust and suffer from diseases of the lungs in consequence. Many instruments have been invented for the inhalation of medicated vapour; but this spray is not vapour, it is a very fine rain, and the temperature can be adapted to the state or requirements of the case. This is its novelty and its merit. The instrument employed is rather bulky, consisting of a pumping apparatus, and a vessel containing the water with the necessary cocks and tubing. We have no doubt that we shall hear something of the use of this method of treatment in this country, ere a long time has elapsed.

OVARIOTOMY IN PARIS.

Paris can boast of its first successful case of ovariotomy, thanks to the skill of M. Nélaton. Our readers will remember that this gentleman has been in England during the summer, and has been on several occasions an attendant at the Operating Theatre of the London Surgical Home, where he was observing the practice of our chief London celebrity in this class of operations, Mr. Baker Brown. Armed with his new experience, M. Nélaton has had the satisfaction of re introducing the operation in Paris, where it was scouted a few years ago as dangerous and unjustifiable. Under the auspices of this case, the operation is now likely to have a fair trial in the French capital. We congratulate M. Nélaton on his success, which we hope will continue to attend his operations.

THE COLLEGE ELECTIONS.

The choice of the Fellows on Thursday last fell on Messrs Cock, Adams, and Paget. It will be remembered that there were three vacancies in the Council caused by the resignation of Sir Benjamin Brodie, the decease of Mr. Stanley, and the retirement, by rotation, of Mr. Cock. The candidates were Messrs. Cock, Adams, Paget, of Leicester, Lane, Bishop, and Turner, of Manchester. The votes were given as follows:—Mr. Cock, 126; Mr. Adams, 121; Mr. Paget, 116; Mr. Bishop, 108; Mr. Lane, 48; Mr. Turner, 44. Mr. Cock is, therefore, reinstated in the Council. Mr. Bishop, however, was not so successful. The usual dinner was held after the election, and was attended with a fair sprinkling of Provincial Fellows.

THE MEDICO-CHIRURGICAL SOCIETY ON SUSPENDED ANIMATION.

The Report of the Committee of this Society on Suspended Animation has just been presented. When we say that the committee consisted of Dr. C. J. B. Williams, Dr. Brown-Séquard, Dr. Hyde Salter, Dr. Harley, Dr. Kirkes, Dr. Sanderson and Mr. Savory, we give the best assurance possible that the duty confided to them has been ably discharged. Numerous experiments were performed, and the most important results obtained appear to have been those relating to the state of the lungs in apnœa. It was found that when a glass tube was placed in the trachea of a dog so as to exclude the air entirely, the animal would recover after four minutes from the deprivation of air; but fifteen seconds beyond that time made recovery hopeless. A dog submerged in water died in a minute and a half. Other experiments brought to light new facts. Two dogs were submerged, one with a closed tube in his trachea, one without; the latter died after two minutes had elapsed, but the former recovered after four. The explanation of this difference of resistance is explained by the fact that in the case of simple apnœa, neither blood nor water was found in the lungs after death, whilst in the case of apnœa from drowning, both blood and water were observed in the bronchial tube, and the lungs were highly congested. These facts were curious and important. The Committee prefer Dr. Silvester's plan as a remedial measure to Dr. Marshall Hall's, because the former was found to displace more air. In this relation of the subject, however, the Report was meagre, and leaves much for further investigation.

BRERETON *v.* GODSON.

The plaintiff in this case was a tailor, who charged the defendant, a Surgeon of standing, residing at Barnet, for maltreatment of his son, who had received a fracture of the lower part of the upper arm. It was alleged that the bandages had been applied too tight, thus leading to ulceration and wasting. The Medical witnesses, however, who were called on behalf of the plaintiff, the chief of whom were Mr. Tatum and Mr. Borlase Childs, did not sustain the allegation. The boy had

not experienced pain, as he would have done, in all probability, if the bandages had been too tightly applied; and Mr. Tatum appeared to think that the resulting mischief was owing rather to a scrofulous constitution. The jury, after hearing the plaintiff's case, considered that there was no blame attachable to the defendant, and the charge was consequently withdrawn. Mr. Godson is thus acquitted; but it may be said of a trial for malpraxis, as the Duke of Wellington once said of a battle, that there was nothing so deplorable as a victory, except a defeat. Mr. Godson has justified his character, so far as it can be justified by a Court of Law; but the anxiety of mind cannot be compensated, and the local suspicions are not so easily appeased. These actions are most cruel; and, when they are brought wantonly, the prosecutor should be held liable to an action for defamation.

LARYNGOSCOPY AND RHINOSCOPY

AS AIDS IN THE DIAGNOSIS OF DISEASES OF THE LARYNX AND ADJACENT PARTS.

Through the kindness of Mr. Yearsley, of Savile Row, we had an opportunity on Saturday evening last, of judging of the merits of these new methods of exploration. Several physicians and surgeons, with Dr. Czermak as the lion of the meeting, assembled on the occasion, and Mr. Yearsley had provided the *materiel* for the experiments in the shape of patients from the Ear Infirmary, in whose cases structural disease existed or was suspected to exist. The first subject for examination was a patient who had been cured of the deafness, for which he had been admitted, but who had also almost lost his voice from a laryngeal affection. Dr. Czermak soon made this apparent to all present by shewing a granulated condition of the vocal cords. The examination was most conclusive, and although such a lesion might have been suspected, how much more satisfactory is it to confirm the fact by ocular demonstration! Mr. Yearsley will now go to work with his patient with no misgivings as to the precise nature, and the extent of the malady he has to treat.

Another triumph of the method was established in the case of a private patient, a young gentleman under the care of Mr. Yearsley for extreme deafness in one ear from scarlatina, an unusual occurrence, as that gentleman remarked, for almost invariably, if affected at all, both ears suffer from that disease. In exploring the Eustachian passage by the catheter (there being no disorganisation of the membrana tympani) the patient had experienced great pain when the catheter reached the orifice of the Eustachian tube. This led Mr. Yearsley to suspect something more than mere irritability of the mucous membrane. He had, consequently, examined his patient by the aid of Rhinoscopy, and being unusually amenable to the experiment, Mr. Yearsley had detected tumidity of the mucous membrane at the orifice of the Eustachian tube. His treatment, therefore, for the previous three days had been the application of a strong solution of the nitrate of silver, which so much improved the patient, that he had on Saturday morning borne the introduction of the Eustachian tube catheter, and had heard the tick of the watch at two inches distance, never before having heard a watch tick since the attack of scarlatina four year ago. Dr. Czermak's exploration was most satisfactory—an excellent view was obtained of the Eustachian tube, and the eschar produced by the nitrate of silver was plainly visible, showing the accuracy with which the remedy had been applied a few hours before.

Whilst the foregoing demonstrations were going on in one room, Mr. Yearsley in another had fixed the catheter in the Eustachian tube of a young girl labouring under deafness from [illegible] engorgement of the cavity of the tympanum. By the aid of a stethoscope applied to his own ear by the listener, and at the same time to the ear of the girl, on air being driven through the catheter, up the Eustachian tube into the cavity of the tympanum, the gurgling of the pent-up mucus could be distinctly heard. One characteristic of this common cause of deafness was stated by Mr. Yearsley to be the inability, partial or complete, of the patient to breathe through the nose.

Several other cases were manipulated upon by Dr. Czermak and Mr. Yearsley with more or less success; and the evening terminated with the usual exhibition on the Doctor's own person, showing how much may be done in the way of exploration of the throat when properly educated and trained for examination. We must not forget to mention that the pleasures of the evening were not a little enhanced by the attendance of a *quondam* patient of Mr. Yearsley, whose enlarged tonsils had been excised with an advantage to the voice truly remarkable. His teacher, Mr. Kingsbury, an eminent professor of music, was present, and testified to the fact, and the pupil himself gave the meeting an agreeable confirmation of it by singing two exquisite ballads. At no distant date the public at large will have an opportunity of judging what can be sometimes done for singers by a judicious surgical operation. Miss Louisa Pyne is another notable instance of Mr. Yearsley's success in this specialty. It was hoped that the pupil-singer would have been able, in the act of singing, to show the action of the vocal cords with the laryngeal mirror applied to the throat. By a little training, Mr. Yearsley hopes to effect this at a future demonstration.

We are authorised to state that these practical demonstrations will be continued during the remainder of the season every alternate Saturday evening, when Mr. Yearsley will give a hearty welcome to any Medical practitioner who may feel interested in these new methods of investigation.

REVIEW OF THE PERIODICALS.

The 'American Medical Times' contains an interesting account of the cases in the Mill Creek Military Hospital, reported by Dr. FREDERICK D. LENTE. The cases had been brought to hospital after the battle of Williamsburg, and had received no surgical attention for a week, as they were all that time *in transitu*. This fact gives us some idea of the imperfect medical arrangements in the Federal army. Dr. Lente says:

"The *wounds* were mostly made by musket-balls and buckshot. When a bone was implicated, it was generally shattered into numerous fragments, which were, in many cases, driven far and wide among the surrounding soft parts. When the bone had been struck by a minie rifle ball, it shattered it at the seat of the wound, and then split it up and down for some distance. There were only two bayonet wounds, and but few shell wounds. Many wounds were apparently made by a flanking fire, as the balls perforated the arm, and either the walls of the chest, or the muscles of the back, making four openings, or passed through both thighs, except when the bone was struck.

"I have been able to classify 214 cases, with regard to the *seat* of the wound. There were—of the *foot*, ten cases; of the *hip*, thirteen; of the *knee*, some involving the joint, and some the bones forming the joint, eighteen; of *lungs*, five; *walls of the chest*, eleven; *leg*, thirty-eight; *thigh*, thirty-six; *shoulder*, twenty-one; *genitals*, six; *skull*, three; *neck*, five; *face*, nine; *spine*, one; *arm and forearm*, seventeen; *hand*, six; *back*, three; *walls of the abdomen*, seven; *abdomen*, five.

"Six of those wounded in the *thigh* were also wounded elsewhere, some in more than one situation; four of those of the leg, five of the genitals, the wounds generally involving the buttock or thigh, five of the hip, five of the arm, two of the walls of the abdomen, five of the shoulder, three of the walls of the chest. In some cases, there were four, five, or six different wounds, and yet the patients doing well. Many of the arm cases were very severe, necessitating amputation at the shoulder-joint, or exsection of the joint or shaft. The wounds, generally in this and the other hospitals, were difficult of management—more so, Prof. W. Parker remarked, than any he had seen.

"On admission, the wounds involving bones, and through the knee, and the few stumps, were in a very unfavourable condition. Of the flesh wounds, although generally of a complicated and severe character, most of them were in a good condition, and continued to progress remarkably well, water dressings being generally used. The wounds of the lungs did well; the patients suffering from them, had all expectorated more or less blood at first, but it had ceased when they entered the hospital. In one case, the ball entered at the lower part of the right lung, and emerged above the spine of the scapula, perforating the lung from bottom to top. The man suffered for a few days with pain and cough, and required the use of anodynes, but subsequently did well. It would seem from

the experience of this hospital, and I believe the same remark would apply to the other hospitals, as far as I could learn, that a gunshot wound of the femur is far more dangerous than one of the lung. If, however, the ball should pass directly through the rib, shattering it, the case would be much more serious. In one of the two fatal cases, the ball passed directly through the middle of the sternum. One interesting feature of the gunshot wounds was the frequency of secondary and of recurrent hæmorrhage, and its obstinacy. This is not so remarkable in military surgery; but it is not so common to have, as we did frequently, secondary hæmorrhage in cases where the amputation, or other operative procedure, was done through perfectly healthy parts, at a distance from the track of the ball. In the first operation performed in the hospital, the ball had passed below the knee, and the advice of more than one surgeon was to amputate at the joint; but, fearing a subsequent sloughing of the posterior flap, I decided to go above the knee. Yet this man died on the sixth day of secondary hæmorrhage. The hæmorrhage, in all the cases, occurred before the period of ulceration of the ligature through the arterial coats. It is to be regretted that *post-mortem* examinations of the stumps were not made, but it was utterly impossible without neglecting the urgent wants of the living. The matter was, however, afterwards discussed with several distinguished surgeons, to whose attention I brought the subject.

"Dr. W. Parker had occasion to examine one case where death occurred from hæmorrhage after both ends of the wounded femoral had been tied by Dr. Bontecou in the Hygeia Hospital. He found the portion of artery between the ligatures sloughy, and that the slough had extended above the upper ligature, thus causing the fatal hæmorrhage. A similar instance has fallen under his notice during the present war. The general opinion was that the hæmorrhage is, in most cases, due to sloughing of the artery above the ligature, and that the sloughing is due to a depraved condition of the patient's blood, brought on by unfavourable hygienic conditions before and after the battle. Let us briefly examine what these conditions were. For some weeks before the army of the Potomac moved from that river, the men had been exposed to a great deal of rain and dampness; and for four weeks after they landed in the peninsula, they were more or less wet day and night, the rain scarcely ever ceasing; added to this, the labour which they performed must have been prodigious. And, amid so much rain and mud, with the necessity of avoiding fires as much as possible, it is to be presumed that the proper cooking of food could not have been systematically attended to. Finally, a forced march through deep mud on the heels of a flying enemy, to Williamsburg, then an attack under a pelting rain, on the entrenchments, and a hard fight of several hours, then the wounded lying for some hours in the mud and rain, then jolted over horrible roads to the York river; then, after further delay, crowded on transports, where they could neither get suitable food nor proper surgical attendance, then the trip down the river, then another transference to ambulance, and conveyance a mile further to the hospital. Fatigue, loss of blood, loss of sleep, starvation; for such food as could be served under these circumstances was not that which the severely wounded could eat. Is it to be wondered at that the blood of these patients should have been dark, thin, diffluent, and defibrinated? But few operations had been performed on the field; and the bad cases, those of compound fracture especially, were in an exceedingly unfavourable condition for operation when additted. The battle was fought on Monday, and they were admitted into the hospital on the Monday following. The limbs were in many instances greatly swollen, infiltrated, and discoloured. In some cases, to wait was certain death—a painful, lingering one. To amputate was almost equally certain to insure death, but there was a forlorn hope, with a brave and hopeful patient, of saving life; and if death should ensue, it was a speedy and painless one. Once, I amputated close to the hip-joint in such a case; the patient died on the table soon after the completion of the operation, never recovering consciousness after inhaling the ether. Once, Dr. Alden March did the same in the lower part of the thigh, with a fatal result, a little less speedy. In many of the less desperate cases, where secondary hæmorrhage did not necessitate immediate operation, we waited in the hope that the general condition of the patient would be improved by the better hygienic conditions in which he was placed, and by the better food and nursing. But the local condition continued to grow worse, and if the patient rallied a little at first, he soon reached a point beyond which he could not be raised, and he then began to sink again. And we can hardly wonder at this, when we reflect on the conditions of the wound—a bone shattered into numerous fragments, and often split upwards and downwards almost to the adjacent joints, especially when a conical ball inflicted the wound; these fragments often driven into the surrounding muscles. This was the condition of most of the cases in which we amputated, and exsected."

The Author then quotes Dr. Macleod's 'Notes on the Surgery of the War in the Crimea,' to show that the experience was the same. Pyæmia was rare in these cases. Dr. Lente quotes John Bell in favour of amputations being done on the field preferably to the sufferer being jolted with a broken bone and lacerated limb in an ambulance waggon for days to some distant hospital, enduring much agony and the imminent risk of fatal hæmorrhage. In order to prevent unnecessary hæmorrhage, Dr. Lente urges the employment of the little ingeniously contrived serrefines, and he goes on to remark:

"Those wounds treated in the Mill Creek Hospital, which did not involve fracture of the large bones, or injury of large arteries, that is, a very large majority of all admitted, although many were complicated and severe, were progressing remarkably well: about fifty had so far improved at the end of a week as to be transferred to a transport for conveyance to convalescent hospitals. During the first week only twelve deaths occurred. The ventilation of the building was almost perfect; in this respect, superior to any of the other hospitals; and, amid all the confusion and inconvenience incident to a hospital of this character, special attention was paid to the nutrition and comfort of each patient, a liberal supply of all necessaries, and many luxuries, having been furnished through the energy of the medical director, Dr. Cuyler, who merits the warmest gratitude of thousands of sick and wounded who have passed under his supervision, and the devoted kindness and liberality of Mr. Barclay of Philadelphia, and Mr. Hayward of the Sanitary Commission.

"This paper has, under the circumstances, necessarily partaken largely of a rambling and desultory character, and has extended itself to rather an inconvenient length, I fear, for your journal. I had intended to notice the triumphant success of *sulphuric ether* as an anæsthetic in military surgery, as far as it was demonstrated in the Mill Creek Hospital, where no other anæsthetic was used, at least during my superintendence. But it must be deferred to another time and another paper."

There is another article in the same journal, giving Dr. David P. Smith's experiences in the practice of Military Surgery, with especial reference to *Amputation at or just above the Knee-joint.* As the results of the cases are not known, we do not think it necessary to quote them. The author reports two cases in which he ligated the femoral artery in Hunter's canal, where there had been great hæmorrhage, on the fourteenth and sixteenth days after the injury, but both patients died.

The 'Medical Times and Gazette' commences with an interesting case, by Mr. John Adams, of *Necrosis of the Lower Jaw* from exposure to the fumes of phosphorus, in which the entire bone was removed. The history is thus given:

"Two years before the appearance of the disease in his jaw, he had a tooth extracted for caries, but he continued quite well two years after this, when the jaw began to inflame. The disease appeared to commence by a swelling in that part of the jaw whence the tooth had been extracted; the swelling continued to extend until the entire bone become affected. He suffered deep pain in the part; and in consequence of his sufferings he came into the Hospital under the care of Mr. Luke; but his precise condition at that time is not known. He was re-admitted under my care in December, 1861, and was discharged cured last April.

"He told me on admission that he had suffered great pain through the entire jaw, and that his nights had been sleepless. He was looking very ill, was much emaciated, and he presented a curious appearance of the mouth, which was pursed up into a round aperture in consequence of the protrusion forward of the enlarged jaw. There were two fistulous openings, one on each side of the upper part of the neck; and a probe introduced struck the angle of the jaw, which was quite dead. I examined the mouth and found the jaw quite dead, and not unlike a jaw you might pick up in a churchyard; it had evidently been dead for some time. I could distinguish every part of the bone except the condyles, which were imbedded in soft tissues. The body of the bone was lodged in a groove of a dense cartilaginous structure, but I could not raise it from its bed in consequence of its fixity at the condyles. There was a large quantity of fetid discharge around it, but the principal part of this came from the vicinity of the condyles. I passed my finger readily along the body and from the angles up the rami of the bone, to satisfy myself that it was quite dead throughout. The outside of the cheeks about the masseteric regions were much thickened. The teeth were all gone, and the appearance of the jaw was that from an edentulated cranium.

"There could be no doubt of the death of the entire bone, but two questions suggested themselves: When was the proper time to remove it? and, How could it be removed without incision?

"In reference to the first point, I was quite aware that a great deal of new hard material had been thrown out, containing, very likely, bony matter, and I was unwilling to disturb that salutary

action by which new bone is formed around the sequestrum, although I had no expectation that this would ever become completely encased in new bone. However, I thought it better to wait, and in the mean time I gave the patient good stimulating diet with porter and wine, until I thought his health had begun to give way. But I was not idle during this time, for at each visit I cut away small portions of the symphysis, my object being, when the bone was divided at this part, to extract each portion separately."

"Finding that I made but slow progress in this way, I had the man brought into the theatre, and severed the bone at the symphysis with a mallet and chisel, as I could not accomplish the division with the strongest forceps I could use.

"To effect this it was requisite that the man should kneel on a cushion, and rest his jaw upon a table. I extracted the right half of the jaw first in two pieces, and a portion of the left; but, as the upper part of the left side was rather firmly fixed, and as the man wished its removal to be delayed, I removed it under chloroform after the interval of a week."

In consequence of severe arterial hæmorrhage coming on ten days after the operation, it was necessary to tie the common carotid; after which the man suffered from palpitation and occasional pains in the left side of the head, which, it is hoped, will gradually disappear. The man was fed well during the progress of the case. With reference to the nature of such cases, Mr. Adams remarks that:

"It may be said to be in its origin a specific inflammation of the periosteum of the jaw, and the jaw itself leading to the more or less complete destruction of the bone. That the inflammation is of a specific character, may be inferred from the fact that extensive bony deposits are found occasionally in irregular masses over the surface of the bone; they have a dingy grey colour, are in texture spongy, and have the appearance of pumice-stone. 'Von Bibra (*loc. cit.*) has made a careful inquiry into the physical structure and chemical composition of this morbid deposit; he finds it lamellated, with large Haversian canals, not running parallel to the general direction of the bone. The bone corpuscles (*lacunæ*) are rounded off; the proportions of organic and inorganic matter varies,—the average being in eight specimens, organic matter 32·4 per cent., inorganic 6·76.

"Now, nothing of this sort is discoverable in the sequestra from death of bone the result of common inflammation. I confess I cannot assign a reason why this disease should attack the lower jaw in preference to the upper; but the fact is so, although in an extensive series of observations the disproportion is by no means so great as is generally believed; thus, out of fifty-five cases collected from various sources by Dr. Letheby, twenty-seven were attacked in the lower jaw, and twenty two in the upper, whilst five were attacked in both jaws, and one case is not specified.

"The next question is, How does the disease take place? I must recall to your mind that, in the case before us, the young man had had a tooth extracted for caries two years before the appearance of the disease, and that, according to his description, the swelling commenced in the spot whence the disease appeared to radiate. I mention this subject because a theory has been advanced, that no disease would attack the bone if the teeth were sound; and that the disease arises from the influence of the poison being propagated down to the periosteum of the alveoli through the carious tooth. My limited experience will not allow me to combat this idea, but I confess I doubt its correctness, nor do I see that this case proves the theory; for, althouth the man had a tooth extracted for caries, yet no disease attacked the jaw for two years after, and when the alveolar cavity had probably been smoothed down by the natural absorption of its edges. But you may say that the disease appears to have commenced in this part; now I think it very likely that this was not the case, but that the young man's attention was first directed to this part when the general swelling of his jaw and consequent pain commenced, and that he was mistaken in the impression that this was the spot primarily affected. If this is found to be true, the disease must be regarded as strictly a local one, and its effects may be prevented by the workers in the lucifer manufactories always defending their teeth by a thin layer of wax, or some other material which might be easily contrived; but I do not suppose that you will ever get workmen to adopt such precautionary means."

Discarding these views, Mr. Adams thinks that the disease is owing to a poisoning of the blood.

Dr. CONNOLLY continues his *Recollections of Varieties of Insanity* in which there is much agreeable reading. Dr. JAMES EDMUNDS reports the *Case of Mrs. Phillips*, whose body was exhumed after four months' interment, on account of alleged poisoning. The body presented no evidence of poisoning as is now well known.

The same journal contains Dr. RAMSBOTHAM'S *Clinical Midwifery* Several craniotomy cases are given, seven of which were primiparæ, one in labour with her second child, which was hydrocephalic, and one in labour with her twelfth. We extract a few of the cases:

"*Craniotomy.—Case.* 110.—On April 4, 1840, at 5.30 a.m., I was requested by another of the District Surgeons of the Royal Maternity Charity to visit Mrs. S., in Spitalfields, aged 43, in labour of her first child. The midwife was first called to her at three o'clock the morning before; the membranes were then broken, but nobody could say when that happened. I found her much depressed, with a very quick pulse, and dejected countenance; the head was jammed in the brim of the pelvis, which did not measure more than three and a-quarter inches in the conjugate diameter; the base being quite above; neither ear could be felt. The vagina and external parts were exceedingly rigid, swollen, and very sensitive; the os uteri was entirely dilated. It was evident that delivery must be immediately resorted to, and that the head was too high for the efficient application of even the long forceps. I therefore perforated it, and had very great difficulty in extracting, even after a great part of the brain was removed. The operation occupied an hour. The uterus was so completely worn out, that it did not contract to expel the placenta; I therefore took it away by introducing the hand. There was very little hæmorrhage, and it remained firm. It was necessary to introduce the catheter once after delivery. Subsequently to that time she passed water freely. But a slough took place in the vagina. On September 18 she called on me, in good health, but with that organ much constricted for about two inches within the vulva upwards. She had menstruated regularly five times since her confinement. I placed her under a course of treatment to relax and dilate the vagina, and soon lost sight of her.

"*Craniotomy.—Case* 111.—On April 26, 1840, at 8 a.m., a Medical friend requested me to see Mrs. H., Clerkenwell, aged 40, in labour of her first child. The membranes broke early in the morning of the 24th. The pains had been very strong up to the evening before I saw her. They then ceased, but she got no sleep. I found her very restless, the pulse at 150 and small, the countenance very much depressed; she was vomiting a large quantity of black offensive fluid. The head was locked in the pelvis, which was narrow throughout its whole extent, especially at the outlet, consequent on the tuberosities of the ischia approaching each other too closely. The scalp was tumid and emphysematous; and the child's body emitted a most offensive putrid odour. The os uteri was quite dilated. The external parts were very rigid, dry, hot, swollen, and acutely tender. I had much difficulty in passing the catheter, owing to the pressure occasioned by the head, but I succeeded in drawing off nearly two pints of urine. I immediately perforated the skull, and delivered with much difficulty in about an hour. The placenta did not descend, and some flooding coming on, I removed it by the hand from the uterus. It was merely retained by inertia. The stimulus of the introduction of the hand into the cavity excited the uterus to contract; and there was no more hæmorrhage. A part of the neck of the bladder sloughed away, so that she recovered with a fistulous orifice into the vagina.

"N.B.—In almost all the cases which I have seen of a fistulous orifice into the neck of the bladder consequent on labour, the child has been putrid; and I attribute the slough more to contact with the putrid head than to simple pressure on the part.

"*Craniotomy.—Case* 115.—On February 10, 1841, at 9.30 a.m., a Medical friend sent for me to Mrs. H., in Bethnal-green road, in labour with her first child. The membranes had been broken for twenty-eight hours, the pains had never been powerful, and the woman's strength was not much impaired. She was greatly deformed in her person, and the pelvis at the brim was under two inches in the conjugate diameter. The os uteri was fully open. The pelvic deformity was of the elliptical variety, there being more room on the left side of the sacral promontory than on the right; but this space was filled by the right foot, which came down when the membranes broke. My friend had been trying to turn the child by bringing down his foot, but could not succeed. Fearing, even if the child was turned, there would be great difficulty in extracting the head through so small a pelvis after having perforated it, I determined on evacuating the brain at once. I therefore, having put a tape round the ankle to hold the foot as a reserve, opened into the skull. I brought away the whole of the parietal bones, a great part of the frontal and occipital bones, evacuated the whole of the brain and cerebellum, and broke each orbit and the foramen magnum, so that I had no purchase left for the crotchet. This took me two hours of hard work, and yet the base of the skull remained above the pelvic brim. I then made traction at the foot, turnd the child with less difficulty than I expected, and brought the head through the brim with comparative ease; because not only was the upper part of the skull broken to pieces by my instrument but the base was also. The placenta gave no trouble, and the

woman recovered without a bad symptom. On April 6, 1843, I learned that she was pregnant again, and recommended that permature labour should be brought on at six and a-half months."

Mr. MASSEY reports two cases of operation for *Femoral Hernia.*

The 'Lancet' opens with a continuation of Mr. HILTON'S lectures on *Pain.* Mr. Hilton shows the importance of his principle of "rest" in the treatment of hip-joint disease, giving several illustrative cases. Dr. PEACOCK contributes a Lecture, one of a series, on the *Recent Epidemic of Fever.* Dr. Peacock says that typhoid is an endemic and typhus an epidemic disease.

"As a general rule, typhus is most prevalent in cold weather, winter and spring; typhoid in warm seasons, summer and autumn; and the explanation of this difference is to be found in the causes which conduce to the spread of the affections. Typhus is in a large proportion of cases propagated by contagion, and consequently spreads most when, from the weather, the poorer portion of the population among whom it prevails are less in the open air, and their houses more crowded and less freely ventilated. Typhoid, on the contrary, generally depends on decomposing animal matters, and is consequently most common in hot weather, when such decomposition most actively proceeds. Our recent observations entirely confirm these views. Of 13 cases of typhus treated by myself, 10 occurred in winter and spring, and only 3 in summer and autumn; while of 32 cases of typhoid, 10 only occurred in winter and spring, and 22 in summer and autumn.

"I have already expressed the opinion that typhus generally depends on contagion. On this point also the experience of the present epidemic is conclusive. Of the 13 patients referred to, in 3 there had been other members of the same families in the hospital labouring under typhus. In some cases it was ascertained that persons of the same family, or residing in the same house, had had fever, or were suffering from it at home or in public institutions; and in others the patients were men out of work, on the tramp from place to place, sleeping in the common lodging-houses or in the union workhouses, where they were very likely to be exposed to contagion. But we have had much more conclusive proof of the infectious character of typhus; for, as you are aware, we have had five of the nurses ill with fever, contracted from the patients upon whom they were in attendance; and in at least two instances, patients labouring under other diseases, in beds adjacent to those occupied by cases of fever, have taken the disease. I have visited the houses from which three of the patients now in the hospital were removed. In one I found that the mother of the family had been removed to the Fever hospital. In another house, four children of the same family had all had fever, and the mother of the patient in the hospital, after having been in attendance upon them, took fever, and died in the workhouse. In the third house, the mother and brother of the patient had died; and a neighbour, the mother of a large family of children, who had gone in to nurse them, took the disease, and had died of it. Thus in four houses not less than twelve cases of typhus had occurred, and at least four persons had died of the disease.

"The question has several times been asked whether, as typhus is thus virulently contagious, we are justified in mixing cases of the disease with patients labouring under other affections. To this I should answer, that so long as the space allotted to each patient in the wards is ample, that there is good ventilation, and that only a limited number of typhus cases is admitted into each ward, there is little or no danger of the disease spreading, except to those who are in constant attendance upon the patients, and who would, under any circumstances, be exposed to take the disease. Thus I have never seen a conclusive case of infection amongst the patients in the new wards; while I have often observed the disease spread in the older parts of the building. Were, however, the typhus patients placed in special fever wards, the poison would become so concentrated that everyone brought under its influence, and not protected by having previously had the disease, would be almost certain to take it."

Typhoid is only slightly contagious; and Dr. Peacock has never seen it spread. Again—

"There is a marked difference between typhus and typhoid fevers in the ages of the persons who are commonly affected by the two diseases. Typhus occurs at all periods of life; typhoid chiefly in young persons, and rarely after middle age. The cases of typhus recently treated occurred in persons ranging from eighteen to fifty-five years of age, and presented a mean age of 30·4; and had two patients now in the hospital, aged five and nine, been included in the calculation, the range would have been still further extended. The mean age of the patients with typhoid was much less, or 19·9, and the range was from eight to fifty-one years, the latter being, however, a very unusual age for any one affected with typhoid. With this exception, no patient was older than thirty, and of forty-four cases of the disease which I analyzed for my last course of lectures on fever, three patients only attained the age of forty, and none exceeded it.

"The diseases also differ very materially in the modes in which they commence, and the severity of the early symptoms. Typhus occurs suddenly, and rapidly produces prostration of strength, so that patients soon seek admission into hospital; typhoid, on the contrary, generally commences by slight indisposition, and so gradually and insidiously advances, that it is often difficult to fix the precise duration of the disease. When, also, in typhoid, there is a more obvious commencement of illness, the attack is often found to have supervened upon a prolonged period of indisposition. To these rules the cases recently treated afford no exception. In six of the cases of typhus, the patients' intelligence was so much impaired at the time of their admission, that no accurate statement of the duration of their illnesses could be obtained; but of the other seven, two were admitted into the hospital on the fifth day, one on the sixth, two on the eighth, and two on the ninth or tenth day, giving a mean period of illness before admission of 7·4 days. In cases of typhoid, twenty-five in number, fourteen were admitted at periods not exceeding a week from the commencement of the symptoms; three in the second week; five in the third week; one at the end of a month; one at six weeks, and one at nine weeks, or eleven at periods varying from one to nine weeks.

"The eruptions which occur on the skin in these forms of fever also present striking differences between the two diseases in the frequency of their occurrence, the periods at which they appear, and the form they assume. The cases of typhus all presented more or less marked eruption on the skin. In one case only, however, was it observed to come out, and in this, the former period of illness could not be ascertained. In the nurses and patients who took the disease in the hospital, the eruption first appeared on the third or fourth day, and in the other cases in which it was already out at the time of the patient's admission, the period of appearance must have been before the fifth or sixth day.

"The form of the rash was generally very characteristic. At first it appeared as discute and slightly elevated spots of a dingy colour, and which faded on pressure. Very shortly the spots ceased to be at all elevated; the subjacent portions of the skin became mottled by what has been termed the subcutaneous rash, and the whole eruption faded less completely on pressure; and still later the eruption became very livid, and was very little, if at all, affected by pressure, and often interspersed with large petechial spots. The lividity of the eruption varied according to the age and power of the patients. In some of the nurses, who were young and healthy, it never had a purple but rather a pinkish colour. In others of the patients who were more advanced in age and less healthy, the spots were from the first very dingy in colour, and rapidly became petechial.

"The duration of the eruption varied considerably. In the slighter attacks it was very trivial, only continuing for a day or two, and never very fully developing itself. In others it became very full, and continued for many days—in different cases from six to fourteen. Usually the amendment was coincident with the disappearance of the eruption; but in some instances, where the eruption had been decidedly petechial, the spots did not entirely disappear till after the patients were well advanced in convalescence. Sudamina were of very rare occurrence in the epidemic, and were few in number when observed.

"In the cases of typhoid the peculiar eruption was noticed in only a small proportion of cases, though it was always carefully looked for. Of three cases, eighteen only presented any spots. This is a much smaller proportion than in the cases which I previously reported upon; of sixty-six cases, the spots were then observed in fifty-three. The period at which the eruption appeared was also usually late than in typhus. Thus it was noticed in only one case before the end of the first week from seizure, in five in the second week, in three in the third week, in two in the fourth week, and in other cases at still later periods. Its form was that of a small, elevated, but not acuminated, rose-coloured, ill-defined, and variously-sized pimples, which appeared in small crops of from two or three to five or six, continued for two or three days, and than passed away, to be succeeded by others, if the disease still pursued its course. The period during which the spots were observed averaged 8·7 days, and ranged from two or three to sixteen days.

"It has been thought that the eruption in typhoid is least frequent in young persons, but my observations do not confirm this idea. Of sixteen persons in whom the eruption was present, the mean age was 20·3, and the extremes of age thirteen and twenty-eight; while of thirteen persons in whom there was no eruption on the skin at any time during the progress of the disease, the mean age was 17·6, and the extremes eight and thirty—a difference too slight to indicate any special influence of age.

"It has also been supposed that the intensity of the disease influences the occurrence of the eruption, but this also appears doubtful. Of the three fatal cases, one had never at any time any eruption; and in the third, which proved fatal during relapse, there was no eruption in the primary attack, but some appeared during the relapse. I believe that the analysis of a larger number of cases would furnish similar results. I have been in the habit of regarding

a copious eruption on the skin, in cases of typhoid, as furnishing rather a favourable omen. In the cases of typhoid—probably in part from the season of the year in which they chiefly occurred—sudamina were both more frequently found and were more numerous than in typhus."

Dr. Morell Mackenzie communicates to the same journal a paper on *Phlebectasis Laryngea*, or congestion of the veins of the larynx, and Mr. Nunneley describes a *New Forceps for use in Ophthalmic Surgery*. The object Mr. Nunneley has had in view is to obviate the necessity of having recourse to the aid of a third hand; he therefore has invented a forceps that can be held between the first and second fingers of the operator,—trying to do too much we apprehend. It does not appear that they have yet been used.

REVIEW OF BOOKS.

On the Strength and Beauty of Mineral Teeth. By Edwin Truman.

This *brochure* is labelled for "private circulation;" but inasmuch as its author has sent a copy to our office, we presume that he has no objection to a public notice of it. Mr. Truman has, it would seem, passed many years of his life in experiments to discover the best material for artificial teeth. In this research he had the advantage of the late Prince Consort's influence in obtaining access to the porcelain factories of Berlin. After having taken infinite pains and visited nearly all the porcelain works in Europe, Mr. Truman adopted a composition and process for the purpose, which appears to have fulfilled his wishes.

Prolapsus, Fistula in Ano, and Hæmorrhoidal Affections. By T. J. Ashton.

This *brochure* is a cut-down of Mr. Ashton's larger treatise. There was no necessity for it, therefore, on the ground of science; but that was a consideration, perhaps, that Mr. Ashton did not take in view when he determined to publish the book. The subject matter shows the same practical ability and knowledge that characterise the larger work.

On the Use of Perchloride of Iron and other Chalybeate Salts in the Treatment of Consumption. By James Jones, M.D.

There is no novelty in the recommendation of the salts of iron for the treatment of consumption, and we do not think that it required a book to prove that the perchloride was a better preparation than any of its fellows.

On the Treatment of Gonorrhœa without Specifics. By J. L. Milton. Second Edition.

Mr. Milton has gained a high professional position by his able writings on gonorrhœa—and his views are widely known and appreciated. The Author prefaces his book with a fierce attack upon critics and criticism, which, we may venture to tell him, will do him no good and his critics no harm. It is a pity he has indulged in this vein. He has good talents, which will make their way in time.

On Uterine and Ovarian Inflammation, and on the Physiology and Diseases of Menstruation. By Edward John Tilt. Third Edition, with coloured plates.

The diseases of the womb have been a favourite topic among authors and practitioners for some years past; but it is chiefly those maladies that affect the os and cervix that have engrossed attention since the publication of Dr. Henry Bennett's well-known work. This author conceived that in nineteen cases out of twenty it was either inflammation or ulceration of these parts that gave rise to the symptoms. This opinion has been disputed, as we think, with justice; and now Dr. Tilt directs our attention to the body of the womb and to the ovaries, as important organs for clinical observation. We must confess to the opinion that the ovaria have been too much neglected in the formation of a diagnosis of disease of the pelvic viscera. A hyperæmic state of the female generative organs has been attributed to the womb as a matter of course; whilst in a considerable number of cases it will be found, on a close examination, that it is one of the ovaries that is the organ primarily in fault. We believe, indeed, that in subacute and chronic cases the ovaries are commonly the suffering parts; and that the uterus is not nearly so often the exclusive seat of mischief as is usually stated. The uterus will bear a great deal of rough handling without resentment; not so the ovaria, which are very sensitive, and easily fall into a state of hyperæmia. Dr. Tilt reminds us that the ovaries, instead of being the mere "appendages" of the uterus, as they are commonly called, are in reality the true sexual organs, and it is the uterus that is the appendage to them. To Dr. Tilt belongs the credit of having directed professional attention in this country to the diseases of these important organs. This book is the result of his experience and labours, and gives us the only comprehensive view in the language of the symptoms and relations of the morbid states of the ovaria.

The author affirms that pelvic peritonitis in woman is generally caused by ovaritis; if he had said that they are commonly coincident states his statement would have been unexceptionable. On the other hand, we have seen pelvic peritonitis ending in gangrene, with the uterus absolutely exempt from disease. The attention of practitioners cannot be too strongly drawn to the frequency of ovaritis; and, as an incentive to the observation of this form of disease, we recommend to them the careful study of this valuable treatise.

MEDICAL SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

June 4th, 1862.

Dr. Tyler Smith, President, in the Chair.

Dr. Richard Hodge read a paper

ON A CASE OF PRESENTATION OF THE RIGHT ARM AND SHOULDER; DELIVERY BY THE NATURAL POWERS, OR SPONTANEOUS EVOLUTION.

This labour set in on the 8th of January; the liquor amnii then escaped, and no more uterine action occurred until the 10th, when the hand was found presenting. An attempt was made to introduce the hand into the uterus to turn, but unsuccessfully, owing to the firm contraction of the uterus; and, finally, expulsion took place by evolution, the breech passing first. The child had apparently been dead some days.

Dr. Tyler Smith related

FOUR ADDITIONAL CASES OF OVARIOTOMY.

The present cases are in continuation of those presented to the Society in February and July, 1861, and numbered from 1 to 8.

Case 9.—*Polycystic disease of both ovaries; operation; death.*—The subject of this case was fifty-nine years of age, unmarried, and had suffered from ovarian tumour for thirty-eight years, a longer period, it is believed, than has been recorded of any similar case. She was of immense size. The operation was by the long incision, the bulk of the tumour being solid. Professor Simpson was present, and assisted at the operation. Numerous adhesions rendered the removal of the tumours very difficult. The pelvic adhesions were especially firm. In breaking them down, the rectum was slightly wounded. The patient died from shock six hours after the operation.

Case 10.—*Polycystic disease of both ovaries; operation; death.*—Mrs. M—— had been suffering from ovarian tumour for two years. She had been once tapped, but ineffectually. The tumour was large, and chiefly solid. There was dropsical swelling of the feet, legs, and abdominal walls; a quick pulse, and great emaciation. The tumours were removed by a moderate-sized incision, but the adhesions were extensive and firm. As in the former case, the pelvic adhesions were the most formidable. The peritoneum was found to be extensively diseased, being covered in patches with masses of scirrhous hardness nearly an inch thick. The pedicles were secured by ligatures, which were left hanging from the lower part of the wound. This patient lingered for three days, and then died of exhaustion.

Case 11.—*Polycystic disease of the left ovary; operation; recovery.*—This patient (Mrs. H——) had suffered for upwards of two years. In the first instance, tapping was attempted, but nothing escaped through the trocar, save a little blood. The tumour was large, and almost entirely solid. There were adhesions to the small intestines, the omentum, and the abdominal walls. The pedicle was of large size, and the clamp was used to secure it. Great irritation and some hæmorrhage were caused by the sloughing of the large pedicle; but with these exceptions her recovery was uninterrupted, and she is now convalescent.

Case 12.—*Polycystic disease of the left ovary; operation; recovery.*—Mrs. H——, aged fifty-eight, was first tapped and pressure applied. Two cysts were emptied, but a considerable quantity of solid matter still remained. After the tumours had refilled, the operation was decided on, and performed in the presence of Professor Nélaton. The tumour was removed by a small incision. It was adherent to the omentum and the abdominal walls. The pedicle was slight, and after being tied with a silk ligature the pedicle and the ligature were cut off as short as possible, and dropped into the abdomen. The wound was then closed entirely. It healed by the first intention. There was not a bad symptom, and in ten days she was convalescent. This is the second successful case in which the author has returned the pedicle and ligature into the abdomen.

Thus, up to the date of the paper, the author has performed ovariotomy in twelve cases. Of these, three have died, and nine have perfectly recovered. One of them has since become pregnant.

Mr. Spencer Wells said that he had been especially interested during the reading of the paper by the account of the two cases in which the pelvic adhesions had been so extensive, and by the mode in which the author had secured the pedicle in two other cases

He (Mr. Wells) felt that those who were learning how to lessen the mortality after ovariotomy had no more difficult problem to solve than the best way to deal with the pedicle. The fact that the author had in two successful cases tied the pedicle and returned it, with the ligature cut off short, into the peritoneal cavity, leaving the ligature and the portion of pedicle which it strangulated within that cavity, and closing the wound entirely, was very surprising; but it taught a very important lesson; and if it did not lead him (Mr. Wells) to follow the example so set without modification, it would certainly encourage him, in any suitable case, to tie the vessels only (not the entire pedicle) with wire, to cut off the ligatures short, return the pedicle, and close the wound. With regard to pelvic adhesions, he would remark that he looked upon them as one of the most serious indications against ovariotomy. He had several times refused to operate where dislocation of the uterus and the presence of fixed portions of an ovarium tumour between the uterus and rectum or the uterus and bladder had been detected; and in cases in which the patients had died of the natural progress of the disease the justice of the decision had been proved. In one case, the rectum, uterus, cyst, and bladder were found so fused together that it was almost impossible to separate them after death. Occasionally, it was extremely difficult to say whether portions of ovarian tumours in the pelvis were adhering there, or were simply pressed downwards and non-adherent. He had two cases of this kind now in the Samaritan Hospital, and he intended to tap the abdominal cysts to see if (when those were empty) the pelvic portion could be pushed upwards. In this manner he had cleared up the diagnosis in other cases. It was only by carefully observing various cases that we could arrive at the knowledge of the conditions which render ovariotomy advisable or otherwise; but we are now beginning to learn this, and to be able to say to a patient or her friends either that the case is one where recovery may be hoped for very confidently, or one where the prospect of success or failure was about equal, or one where the conditions are so unfavourable that no reasonable hope of success could be entertained. Among these conditions he was disposed to class pelvic adhesions. At least this was the result of his own experience, and the two fatal cases narrated this evening supported that view. The Profession in general, and those who were endeavouring to diminish the mortality after ovariotomy in particular, were much indebted to the author for this addition to their knowledge.

Dr. W. Tilbuy Fox read a paper

ON THE VESSELS CONCERNED IN THE PRODUCTION OF PHLEGMASIA DOLENS.

The Author first referred to Dr. Mackenzie's experiments as insufficient to determine the question of the production of phlegmasia dolens, and proceeded to argue that venous obstruction is followed by œdema only; that the action must be the same, whether the obstruction be produced locally or indirectly through a vitiated blood condition. If any difference in the two cases existed, the changes over and above œdema, which characterise the lesion as phlegmasia dolens, must be ascribed to the action of the blood state (which is absent in the locally produced disease) upon the general textures of the limb. If this view be adopted, the influence of the veins is *nil*, and we must look for the explanation in a special action carried on between the blood and the tissues. That the clinical history forbids the acceptance of such a doctrine, inasmuch as the very conditions (viz., blood-vitiation tending to produce "phlebitis") which are regarded as the cause of phlegmasia dolens very frequently exists, and yet are very rarely followed by white leg—for example, in the various blood-poisonings unconnected with the purulent condition. That if produced under the circumstances mentioned, the disease ought not to be so frequently unilateral, nor confined to the lower limbs. That the occurrence of white leg in cases of cancer, phthisis, pressure, &c., could not be explained hereby. That the death-rate of phlegmasia dolens forbad the same interpretation of the phenomena. That in the experiments of the injection of lactic acid into the blood by Dr. Mackenzie, there was no evidence to show that in the dogs operated upon anything but œdema resulted. That the existence of phlebitis, except as the rarest feature, is fallacious in cases of venous disease. Attention was then drawn to the distinction between the coincidences and the essentials of phlegmasia dolens, as in the case of puerperal fever complicated by the latter. For example, take away from the general total of such case the proper puerperal fever symptoms, and the phlegmasia dolens remains in perfect integrity; *per contra* take away the hot, white, tense, elastic swelling, and the puerperal fever remains in its entirety. In the combination, however, the pathological changes normal to phlegmasia dolens may be modified by the tissue actions, (abscess, &c.), which are the consequences of the existence of a virus in the blood; in uncomplicated phlegmasia dolens, the tissues are passive, so to speak.

The succeeding remarks went to show that the theory propounded by White was correct with regard to the *nature*, though not as to the *cause*, of phlegmasia dolens; that in the natural condition a large quantity of lymph travels from the limbs towards the thoracic duct, and when this current is impeded markedly white leg resulted. The case of the absorption of a poison into the cellular tissue (which, according to some, controverts White's opinion) was examined, and it appeared that this might or might not be followed by phlegmasia dolens, according as the obstruction in the lymphatics affected the main current or merely some minor channels (the latter being the rule); the swelling being modified in severe cases, as before observed, by the relative action of the septic blood state and tissues. Cases were quoted to prove that lymphatic obstruction is sufficient, and alone necessary, to give rise to phlegmasia dolens. The paper concluded with the following summary:—

1. Phlegmasia dolens is a local disease.

2. No general symptoms need be present (implying absence of blood-poison).

3. Phlebitis, however produced, cannot give rise to phlegmasia dolens, but œdema only.

4. Phlegmasia dolens may occur in, but forms no necessary part of, blood-poisoning (such as tends to phlebitis), but is modified thereby frequently; and any tissue conditions over and beyond the presence of fibrinous serosity, and the consequent hypertrophous state of the areolar tissue, are in nowise essential components of phlegmasia dolens, but common alike to very many different "blood" diseases.

5. Obstruction to the main lymphatic channels alone is capable of giving rise to white leg, and acts by preventing the removal of the lymph from the affected limb.

6. The obstruction may be the result of (*a*) extrinsic pressure; (*b*) thrombosis due to sudden (compensatory) absorption of vitiated fluid after sudden loss of any kind; (*c*) inflammatory changes in the vessels themselves (rare).

7. The effect of the action of venous obstruction upon the phlegmasia dolens as an intensification of the general swelling, and the presence of œdema during the subsidence of the enlargement of the limb.

Lastly, a frequent but unrecognised source of blood-vitiation was alluded to—namely, in cases where large tracts of cellular tissue were diseased—as in erysipelas, sloughing, cancerous, phthisical, and dysenteric ulcerations and the like—the lymphatics, charged with effete matter, and an excessive number of imperfectly-developed pale cells, formed in their glandular part, poured their contents into the venous system from the thoracic duct; and this might be a cause of thrombosis at the right side of the heart and in the vessels leading to the lung.

Dr. Tyler Smith thought the Society very much indebted to Dr. Fox for the able way in which upon several occasions he had brought forward this important subject. His own view was that all the symptoms of phlegmasia dolens might be produced either by obstruction of the veins, arteries, or lymphatics; but that pathology and clinical observation combined to show that obstruction of the veins was the lesion most frequently found in these cases. The author of the paper had rendered a service by directing special attention to the lymphatics in this disease—a point which had been somewhat lost sight of in the present day.

Dr. Fox, in reply, asked the President to explain how phlegmasia dolens resulted in cases where no trace whatever of venous disease existed post mortem; and how it was, supposing blood-vitiation and venous obstruction to be the cause, that sometimes œdema and sometimes phlegmasia dolens resulted; why the swelling commenced sometimes above and sometimes below; why phlegmasia dolens, which was a greater degree of disease than œdema, resulting from blood-vitiation (according to prevailing theories), possessed so low a mortality. It was evident in blood-disease, as appears from recent pathological inquiry (especially brought out in the late discussion on puerperal fever at the Parisian Academy), that the lymphatics are as frequently affected as the veins, as in the broad ligament of the uterus. A distinction must be drawn between thrombosis and inflammation of the lymphatics, which was usually due to septic poison, obstruction being uncommon, and certain tissue actions, set going in answer to the blood state, modifying the whole character of any swelling. He (Dr. Fox) did not throw cold water upon pathological facts, for the paper was based upon such; but thought that experimental evidence, such as that brought forward by Dr. Mackenzie, should not set aside clinical facts.

Professorship of Anatomy, Physiology and Pathology.—The Council of the University of Melbourne propose to appoint a professor of the above-named sciences during the present year. He will be required to give complete courses of lectures on Descriptive and Surgical Anatomy, and on General Anatomy, Physiology, and Pathology, and to act as Conservator of the Anatomical Museum. The salary will be 1,000*l.* a-year, with residence. The Professor will be required to devote his time exclusively to his duties in the University, and will not be allowed to practise. Candidates may send written applications, with not more than three testimonials, on or before June 23, to Sir Redmond Barry, Chancellor of the University of Melbourne, at Arthur's Club, St. James's, London, S.W.

Trinity College, Dublin.—The following degrees were conferred at the Comitia Æstiva, on July 2, 1862:—Bachelors of Medicine.—Isaac Ashe, Stephen Flood, William Stanley Pardon. Master in Surgery.—Isaac Ashe.

Births, Marriages, and Deaths.

BIRTHS.

ARMSTRONG.—On the 1st inst., at Peckham, the wife of H. Armstrong, M.D., of a son.

BEAZELEY.—On the 21st ult., at her father's (A. Martin, M.D.) house, at Rochester, the wife of Michael Beazely, Esq., of a son.

CHAMPNEYS.—On the 23rd ult., at Battle, Sussex, the wife of Henry Montagu Champneys, Esq., F.R.C.S., of a daughter.

DICKINSON.—On the 27th ult., at Chesterfield street, Mayfair, the wife of William H. Dickinson, M.D., of a daughter.

LANSDOWN.—On the 29th ult., at Park street, Bristol, the wife of F. Poole Lansdown, Esq., M.R.C.S., of a daughter.

MORRIS.—On the 24th ult., at Church street, Lower Edmonton, the wife of Charles James Morris, Esq., M.R.C.S., of a son.

RICHARDS.—On the 26th ult., at St. George's place, Brighton, the wife of D. Richards, Esq., M.R.C.S., of a daughter.

SHINE.—On the 21st ult., at St. Germain's terrace, High road, Lee, the wife of William Lamb Shine, Esq., M.R.C.S., of a son.

WOOD.—On the 30th ult., at Onslow square, the wife of Neville Wood, M.D., of a daughter, still-born.

MARRIAGES.

GARRINGTON—MOODY.—On the 1st inst., at Kingston church, Portsmouth, Arthur M. Garrington, M.D., of St. George's square, Portsea, youngest son of W. H. Garrington, Esq., J.P., to Sarah, youngest daughter of W. Moody, Esq., H.M.'s Dockyard, Portsmouth.

JACKSON—GATIS.—On the 5th ult., at St. Peters's Collegiate church, Wolverhampton, T. Vincent Jackson, Esq., M.R.C.S., (late Resident Surgeon to the South Staffordshire General Hospital, Wolverhampton,) of Darlington street, Wolverhampton, to Alice Jane, eldest daughter of James Catis, Esq., M.R.C.S., of North street, Wolverhampton.

SMITH—CLODE.—On the 18th ult., at St. John's church, Windsor, Charles John Smith, Esq., M.R.C.S., eldest son of Charles Smith, Esq., of Church house, Newington, Surrey, to Sarah Anne, only child of John and Sarah Clode, of Park street, Windsor.

DEATHS.

CARTER.—On the 28th ult., at Matlock, Daniel Carter, M.R.C.S. Eng., L.S.A. Lond., Surgeon R.N., (Sept. 29, 1855), of 79 Packington street, Islington, aged 37.

GREATREX.—On the 23rd ult., at Holborn hill, Mary, the wife of Augustus Greatrex, M.R.C.S.

HOUGH.—On the 27th ult., at Cambridge, Eliza Sophia, eldest daughter of James Hough, Esq., M.R.C.S., aged 15.

LAWRENCE.—On the 27th ult., at Fulborne, Cambridge, Louisa, the wife of George W. Lawrence, M.D., aged 20.

MACCOSH.—On the 3rd ult., at Paris, Canada West, Robert MacCosh, formerly of Beith, Ayshire.

MILES.—On the 19th ult., at Plymouth, on his arrival from Vera Cruz, Edward Falconer Miles, M.R.C.S. Eng., Assistant-Surgeon (May 17, 1861), of H.M.S. 'Donegal,' aged 26.

MOSSE.—On the 26th ult., James Robert Mosse, M.R.C.S. Eng., L.S.A. Lond., of High street, Fareham, Hants.

WOOD.—On the 21st ult., at Eccles New road, Manchester, Thomas Wood, M.R.C.S. Eng., L.S.A. Lond., late of Grosvenor street, Chorlton-on-Medlock, Manchester.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following Members of the College, having undergone the necessary examinations, were admitted Licentiates in Midwifery at a meeting of the Board on the 2nd inst.:—Barlow, Robert, Dalston—diploma of Membership dated July 29, 1859; Barnes, Thomas Henry, Clare, Suffolk—May 6, 1862; Carter, Jabez, Bedford—June 12, 1862; Couch, John Quiller, Polperro, Cornwall—May 21, 1862; Dry, Thomas, Salisbury place, Walworth—April 25, 1862; Dunderdale, William, Poulton-le-Fylde—May 8, 1862; Edwards, Morgan John, Rhoudda Valley, Newbridge, Glamorganshire—Nov. 14, 1861; Jones, John Lloyd, Treborth, Carnarvonshire—Nov. 14, 1861; Kernot, Charles Noyce, West Cowes, Isle of Wight—May 8, 1862; Masters, William Hooper, Yeovil, Somerset—Nov. 14, 1860; Matthews, James, Hammersmith—April 24, 1862; Sheppard, Walter George, Dorchester—May 20, 1862; Rutherford, Samuel, Pulborough, Suesex—April 23, 1862; Wilson, John Wise, Brunswick place, Barnsbury road—Jan. 31, 1862.

APOTHECARIES' HALL.—The following gentlemen passed the examination in the Science and Practice or Medicine, and received certificates to practise, on the 26th ult.:—Brumwell, John Robert, Burnley; Gabb, Frederic Edward, Cheltenham; Hubert, Theodore Kelsall, St. George's Hospital; James, James, Aberavon; Lee, William Edward, Bideford, Devon; Richards, Henry Ebenezer, St. George's Hospital; Robinson, Hugh, Ripon, Yorkshire; Rowland, Henry Orford, Ipswich.

The following gentlemen also on the same day passed their first examination:—Carter, Richard, Charing-cross Hospital; Fry, John Blount, Sydenham College, Birmingham; Julins, George Frederic H., King's College; Ring, John, Middlesex Hospital.

[The Christian names of Mr. Hayden, who passed the first examination at the Hall on the 19th ult., should have been "William Gallimore," and not "William George," as published in the MEDICAL CIRCULAR of last week.]

OXFORD UNIVERSITY.—At a Congregation held on the 26th ult., the following degrees were conferred:—Doctor of Medicine—Moore, William Daniel, Trinity College, Dublin. Bachelors of Medicine—Clarke, William Fairlie, Christ Church College; Crucknell, Henry Heanes (Fellow), Oriel College; Evans, Herbert Norman, Exeter College; Harrington, James Douglas, Exeter College.

THE PRESIDENT OF THE ROYAL COLLEGE OF PHYSICIANS.—The name of Thomas Watson, M.D., F.R.S., occurs in the list of those distinguished persons who on Wednesday last received from the University of Oxford the honorary degree of D.C.L.

THE FRENCH ARMY IN MEXICO.—M. Albert Ehrmann, *Médecin-major de première classe*, who sailed with the first French troops in February, has been appointed Medical Director of the Expeditionary Corps, in place of the late M. Ludger-Lallemand.

HONOURS CONFERRED ON MEDICAL PRACTITIONERS IN ITALY.—The celebrated Professor Buffalini, of Florence, has been made Grand Officer of the Order of St. Maurice and St. Lazarus; M. Sperino, of Turin, has been made Commander; and M. Rizzoli, of Bologna, Officer of the same Order.

THE MIDDLESEX HOSPITAL.—The Annual Distribution of Prizes will take place in the Board-room of the Hospital, on Friday, July 11, at three o'clock, p.m.; Captain the Hon. Francis Maude, R.N., in the chair.

THE FAILURE OF THE OPIUM CROP in India has had the effect of considerably increasing the market value of this drug.

THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The Cambridge meetiing of this Aociation has been postponed till October.

THE ANTIQUITY OF PLAGUE.—M. Chabas has recently thrown great light on the probable antiquity of plague. It was known to the ancient Egyptians under the name of Aat.

THE BRITISH MEDICAL ASSOCIATION.—The annual meeting of the Lancashire and Cheshire branch of this Association was held at the Royal Institute, Manchester, on the 25th ultimo. The next annual meeting will be held at Liverpool.

CHARING-CROSS HOSPITAL ACCOUNTS.—At the Manchester meeting of the British Medical Association, the mode of keeping accounts at this hospital was especially recommended for imitation by all similar institutions.

PALMER THE MURDERER.—At a recent meeting of the supporters of Dr. Lankester in his canvass for the office of Coroner for Central Middlesex, Dr. O'Connor, Physician to the Royal Free Hospital, related the following interesting occurrence as an instance of the necessity for having Medical Coroners. Addressing the meeting on the subject of Palmer's trial, he said:—"I will relate to you an interesting occurrence in connexion with that trial to prove that a Medical man, of the acquirements and professional knowledge of Dr. Lankester, is the most fitted person to fill the office of Coroner. It will be in the recollection of the meeting that the presiding judges on the occasion of the trial of Palmer were the late Lord Campbell, the late Baron Alderson, and Sir C. Cresswell. The Baron belonged to a family some of whom were able Physicians. One was the late Dr. Alderson, of Hull, another, Dr. Alderson, the present accomplished Senior Physician of St. Mary's Hospital. Baron Alderson, desirous of obtaining reliable information regarding the effects of atrychnine on the animal economy, sought the advice of his relative, who readily, with the aid of Mr. Copney, then Dispensing Apothecary at St. Mary's Hospital, went through a series of experiments with strychnine on frogs, and some of the lower animals. The Baron immediately afterwards communicated to Lord Campbell a full account of what he had witnessed, when the latter expressed an earnest desire to see the experiments repeated. Dr. Alderson promptly complied with the request, and a meeting took place at his house in Berkeley square. There were present on the occasion—Lord Campbell, Baron Alderson, Sir C. Cresswell, Dr. Paris (then President of the College of Physicians), Dr. Alderson, and Mr. Copney. After five hours' careful observation, during which many experiments were gone through showing the effects of doses of various degrees of strength of the strychnine, and the different tests applied for its detection, Lord Campbell and his brother Judges left better acquainted with the poisonous nature of strychnine and the processes necessary for its detection than many of the witnesses who were examined. This circumstance, which he (Dr. O'Connor) was able to state on the best authority, and which had never before been made public, was an admission by the Judges of the necessity of Medical knowledge on the part of persons presiding over injuries as to the cause of death, and it enabled the Judges with much greater facility to get through the conflicting evidence given at the trial, whilst it contributed much to the just conviction of Palmer."—'Morning Post.'

THE LUDGATE-HILL MURDERS.—In the examinations of Mrs. Vyse, before Alderman Wilson, no new facts of medico-legal interest were adduced. Mr. Attfield's analyses of the contents of the stomachs, and of Mr. Battle's vermin killer, were simply quantitative. He made no attempt to determine the amount of strychnia swallowed, although his experiments were quite decisive as to the presence of the poison. The state of the prisoner's mind is still only a matter of inference. It appears that she gave her sister a letter referring to her crime, but the latter had on her own judgment destroyed it without making herself acquainted with its contents. Before purchasing the preparation of strychnine she had asked the chemist for hydrocyanic acid. On being discovered she said that "she was mad and wished to die." It is believed that a porter in her husband's employ, named Smith, and one of the Hospital nurses in attendance on her, could, if they pleased, give information as to the circumstances which led to the commission of the murders. Mrs. Vyse is committed for trial.

OVARIOTOMY IN PARIS.—Professor Nélaton has just performed the operation of ovariotomy, on a woman of twenty-six, who had been ill only one year, but with whom the accumulation of water was so rapid that she was tapped in May last. The cyst filled again in a short time,

and M. Nélaton removed the whole growth on the 17th ult. After the incision of the abdominal walls, the cyst was seized with blunt forceps and tapped. When quite emptied, it was found to adhere to a portion of omentum, which latter was cut, a small piece of it remaining attached to the cyst. The latter was connected with the uterus by a very narrow pedicle, which was seized with a peculiar instrument, and divided. Three small omental arteries were tied, and the wound closed by six metallic sutures. Some blood had trickled into the abdomen, and as M. Nélaton considered that it might decompose, and be of great prejudice, he removed it from the cul-de-sac between the uterus and rectum by means of a sponge twice the size of a fist. The cyst was multilocular, and contained about eight quarts of a viscous stringy liquid. The patient was operated on in a country house near Paris, and was in a very favourable state a week after the operation. We must not omit to state that, on the 2nd of June last, Mr. Kœberlè, deputy-professor at the Faculty of Medicine at Strasburg, performed the operation of ovariotomy on a woman of twenty-six. The diameter of the cyst was from nine to ten inches; and we are glad to say that, on the 20th of June, the patient was doing extremely well, and likely to make a good recovery.

Deaf Mutes.—The first number of the 'Social Science Review,' just published, contains a curious paper on the statistics of the births of deaf and dumb children collected by M. Boudin, supporting the popular dislike of marriages of consanguinity on physical grounds. According to M. Boudin the result is a very considerable per-centage of deaf mutes. Where the relationship is the nearest, the per-centage is the highest. M. Boudin finds that consanguineous marriages take place in France in the ratio of 2 per cent. of the population; that of the issue of such marriages the proportion of deaf and dumb children is 28 per cent. in Paris, 25 at Lyons, and 30 at Bordeaux. At Berlin he has discovered that the number of deaf and dumb children born of Christian parents is 6 per cent.; while that of the children of Jewish parents is 27 per cent.—a result which he attributes to the fact that Jews intermarry with blood relations more frequently than Christians.

The Weight of the Human Body at Different Seasons of the Year.—Mr. Milner weighed the prisoners in Hull Gaol for five years, and found that they regularly increased in weight from April to November, and decreased from November to March. The diet was the same all the year round, and as nearly as possible the same temperature was maintained.

Discovery of a Human Skeleton at Leicester in the bed of the Soar.—Mr. James Plant, of Leicester, in the 'Geologist' of this month states:—On the western side of the town of Leicester there was an old bridge known as the "Bow Bridge." It has recently been taken down for reconstruction; during the progress of the work the stream has been stopped, and a dam thrown across the channel north and south of the bridge, leaving the bed of the river dry. The upper surface was a black, muddy, alluvial deposit, but this being penetrated, the pure drift gravel presented itself. This gravel lies immediately on the abraded surface of the Upper Keuper Sandstone, which here dips away under the town towards the Liassic hills on the eastern side. In excavating on the east side of the old bridge for the new foundations, and digging in the bed of the river, they came upon ground in the drift of a mixed character, gravel and silt. After digging out three feet of this, they came upon a human skeleton lying face upwards, the knees drawn towards the head. It was nearly entire, a few of the vertebræ and the smaller bones of the hands and feet only are wanting. Near this skeleton were found the skull of a horse, ox horns, and other bones. The horn-cores of the ox appertain to the *Bos primigenius*. Their mineral condition is very different from the human skull, which beyond its being slightly prognathic, and exhibiting rather thick canines, does not offer any marked peculiarity. Its antiquity may be considered as very doubtful.

The South Hants Medico-Chirurgical Society.—On the 21st ult., the members of this society held their annual gathering at the Royal Victoria Hospital, Netley. There was a numerous assemblage of metropolitan and provincial practitioners. Dr. Wiblin, the President of the Society, occupied the chair at the dinner-table. The usual loyal toasts having been drunk, Mr. Falvey proposed "The Members of the South Hants Medico-Chirurgical Society," and said "that the whole nation was deeply indebted to the Medical Profession for the zeal and energy with which they always endeavoured to ameliorate human suffering," and referred to the high position occupied by their President of that day, to whom they were so largely indebted for so great a treat. The toast having been drunk with great enthusiasm, Dr. Wiblin, in returning thanks, said that, "Speaking for himself and his professional brethren of the Society, it afforded them the greatest gatification to meet their metropolitan and provincial friends in that building, and hoped that they might have many of those agreeable *réunions*." Dr. Orsborn proposed the health of Major Ravenhill in an eloquent speech, in which he described in glowing language the advantages of the site of Netley Hospital, which he characterised as a magnificent building, fitted in every way for the purposes for which it was erected. After dinner the company visited Netley Abbey, and separated well pleased with the enjoyments of the day.

Venomous Caterpillars.—A most singular case, perhaps the only one on record, of death caused by caterpillars occurred a few days ago in the commune of Dardilly, near Lyons. A little boy, not more than eight years old, had gone into a neighbouring wood, in quest of birds' nests. Perceiving one on the top of a tree, he climbed up, but in so doing shook down an immense number of caterpillars, many of which fell on his shirt, his only upper garment, and soon covered his breast, which was bare, and penetrated to his arms and shoulders. For a few minutes the child took no notice of this, but he soon felt such an itching sensation that he was compelled to get down again and run home for assistance. Upon examination, his skin appeared covered with large red spots, which were soon followed by a general swelling, then by fever, somnolency, and delirium; and, notwithstanding all Medical care, death ensued in the course of a few hours. The kind of caterpillar which caused this disaster was the *Bombyx processionea* of Réaumur, a very venomous species. Botanists know that if a nest of these insects be touched, or only stirred up with a stick, the person so doing, and remaining for some time near the spot, within reach of the emanations arising therefrom, will be attacked with a papulous eruption of a more or less confluent nature, which will last several days, and be attended with violent itching. Dr. Calmell, Physician to the Hospital of Charenton, had preserved a nest of these caterpillars in a large glass phial, which was not opened for upwards of ten years. At length, the phial being accidentally wanted, it was opened in the presence of several persons, who all caught the eruption. This strange property has even suggested to several members of the Faculty the idea of using these caterpillars in cases in which it is required to subject the skin to a strong and permanent irritation. We may remark, in conclusion, that the number of caterpillars which infest the trees this year all over France is quite unprecedented,—a circumstance which has called the attention of the authorities and of various learned societies to the question of protecting insectivorous birds, the only really efficacious enemies of the caterpillar.—'Galignani's Messenger.'

Hospitals at Fortress Monroe.—Having recently returned from Fortress Monroe, I send you a brief statement of some of the objects of interest in the military hospitals of that vicinity. The old Hygeia Hotel, attached to the fortress, has been coverted into a military hospital, with several hundreds of beds occupied by sick and wounded soldiers. About two miles west of this is the Chesapeake Hospital under the supervision of Dr. McCay, Brigade-Surgeon. The principal building in this locality is a large edifice known as the Chesapeake Female College; besides this, there are connected with this establishment two detached cottages and a considerable number of tents. There are six or seven hundred beds in the establishment occupied by medical and surgical patients, including a large number of soldiers wounded at Williamsburgh at the great battle on the 5th inst. Between the Hygeia and the Chesapeake Hospitals is the Mill Creek Hospital, under the supervision of Brigade-Surgeon Hunt. This is a gigantic shanty, containing two hundred and fifty beds occupied by soldiers who were wounded at Williamsburgh. The situation of the Mill Creek Hospital is low and marshy, and the air around it is redolent with foul odours. Among the wounded in these hospitals are many of the confederate soldiers, although the large majority is composed of men who fought for the stars and stripes. The soldiers of both armies are treated with equal kindness and care, and I have abundant evidence that the wounded rebels appreciate fully the kindness with which they have been treated. All the wounds which came under my observation, were inflicted at the battle of Williamsburgh on the 5th inst., and they came under my notice on the 12th, exactly a week after the battle. They were then in a state of imperfect suppuration, the sloughs not yet having been thrown off. Nearly all of them were occasioned by musket or rifle balls, either conical or spherical. Some of them were occasioned by buck-shot or small bullets fired from revolvers. A few were occasioned by fragments of shells. In a few instances balls were lodged in the tissues; but, in most cases, they had passed through the body or limb, and had escaped through a second opening. In one instance, a single ball had made six holes, having passed through the fleshy part of both thighs and through the scrotum, without apparently injuring either testicle. In another instance, a ball had passed through the right forearm, and through the right side of the thorax, making four holes. In one case, a ball passed through the right side of the corpus cavernosum, thence through the root of the scrotum, and through the left side of the corpus spongiosum, making a free passage for the urine through the perinæum, and without injuring the thigh. A young man from Mississippi was shot through both lungs: he discharged from the wounds enormous quantities of bloody and purulent fluids. He survived the injury more than three weeks, and almost to the last had sufficient strength to sit up when his wounds were dressed. One man had a wound of the hip-joint, the ball having passed through the great trochanter, and thence through the head of the femur, and across the dorsum of the ilium to the cleft of the nates. He lived eleven days after the injury. Another, with compound fracture of the thigh near its middle, with extensive shattering of the bone, and with very profuse suppuration, survived the injury about three weeks. There were a number of cases of secondary hæmorrhage. The first occurred ten days after the infliction of the wound. The case was that of a young man, in whom the ball had passed from the upper and inner part of the thigh, a little below the pubes, down to the upper and outer part of the leg near the head of the fibula. The hæmorrhage was sudden and profuse, the blood issuing from the upper wound. As the track of the ball was very extensive, and the exact situation of the opening from which the hæmorrhage proceeded quite uncertain, I applied a ligature to the femoral artery, a little below the origin of the profunda. On the afternoon of the same day I was called to see the patient again, being informed that bleeding had recurred. On opening the wound, I found a small recurrent artery near the lower part of the incision which I had made throwing out a jet of dark blood. I tied this little vessel, and there was no return of hæmorrhage, but the patient died of pyæmia eight days afterwards. The next case of secondary hæmorrhage occurred on the day following the preceding case—viz., eleven days after the battle. It occurred from a wound in the mouth traversing the right side of the neck behind the angle of the jaw. The hæmorrhage was arterial and profuse; I tied the primitive and carotid arteries. The hæmorrhage did not recur, but the patient died from exhaustion about thirty hours after the bleeding took place. The third case of secondary hæmorrhage occurred from a wound in the axilla, fourteen days after the battle. The hæmrorhage was very copious, and the patient appeared much exhausted. I cut down into the axilla, and tied the artery above and below the wound. I found that the median nerve had been severed

by the ball, and that ganglionic enlargement had taken place at its proximal extremity. All the cases of secondary hæmorrhage which I saw were from the tenth to the sixteenth day after the injury.—'American Medical Times.'

APPOINTMENTS.—William Hugh Aldersey, F.R.C.S. (exam.), and L.M., L.S.A. Lond., has been re-elected Medical Officer for the South-East District of the Buntingford Union, Herts.—Joseph Ashton, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Waddingham District of the Caistor Union, Lincolnshire, *vice* William Noble Paterson, L.R.C.S. Edin., L.M. Edin., whose term of office has expired. Herbert Frederic Henry Barham, M.R.C.S. Eng., L.S.A. Lond., has been appointed Resident Medical Officer to the Kent County Ophthalmic Hospital, Maidstone, *vice* Alfred Frederick Stratford Clarke, M.D. Univ. St. And., M.R.C.S. Eng., and L.M., L.S.A. Lond., resigned on being placed on full-pay list as Staff Assistant-Surgeon, Army.—Henry Blenkinsop, F.R.C.S. Eng., L.S.A. Lond., has been appointed Surgeon to the County Prison at Warwick, *vice* Thomas Wheatley Hiron, M.R.C.S. Eng., L.S.A. Lond., resigned.—John Carleton Bury, L.K.C.Q.P. Irel., M.R.C.S. Eng., L.M. Dub., has been elected Medical Officer to the Workhouse of the Wisbech Union, Cambridgeshire, *vice* William Herbert Hole, M.R.C.S. Eng., L.S.A. Lond., resigned.—Albert Davies, M.D. Mar. Coll. Univ. Aberd., M.R.C.S. Eng., L.S.A. Lond., has been appointed Surgeon to the newly-established Dispensary, Ely, Cambridgeshire.—Charles Gaffney, M.R.C.S. Eng., and L.M., L.S.A. Lond., has been re-elected Medical Officer of the North-East District of the Buntingford Union, Herts.—John Wycliffe Goodwin, M.D. Cantab., Physician to the Suffolk General Hospital, Bury St. Edmund's, has been nominated one of the Examiners for Medical degrees at the University of Cambridge, for the academical year commencing in October next.—George Edward Horton, M.R.C.S. Eng., has been elected Vaccinator for Dudley, Worcestershire, *vice* William Eagles Johnson, M.R.C.S. Eng., L.S.A. Lond., deceased.—Thomas Leeds, M.R.C.S. Eng., L.S.A. Lond., has been appointed resident Medical Officer to the General Hospital and Dispensary for Sick Children, Manchester, *vice* William Lomas, M.R.C.S. Eng., L.S.A. Lond., resigned.—Geo. Winter Rhodes has been elected Medical Officer for the Northern Division and the Hospital of the Township of Hudersdfield, Yorkshire, *vice* Thos. Robert Tatham, M.R.C.S. Eng., L.S.A. Lond., resigned.—Henry Bennett Smith, M.R.C.S. Eng., L.S.A. Lond., has been re-elected Medical Officer and Public Vaccinator for District No. 7 (the parish of Brightling) of the Battle Union, Sussex.—Mr. Joseph Truelove has been appointed Dispenser to the Suffolk Genera Hospital, Bury St. Edmund's, *vice* Mr. Joseph Simpson, resigned.—Dr. George C. Pirie has been appointed Physician to the Dundee Royal Infirmary; and Dr. William Crockatt has been appointed Attending Surgeon.—Dr. George B. York has been elected Medical Officer and Public Vaccinator for the Sixth District of the Upton-upon-Severn Union, Worcestershire, *vice* Mr. Charles J. Axford, resigned.—Mr. Wm. W. Phillips has been elected Medical Officer and Public Vaccinator for the Northern District of the Wittlesea Union, Cambridgeshire, *vice* Mr. Peter V. Timothy, resigned.—Mr. Davis D. Tate has been appointed Resident Medical Officer to the North Union Workhouse, Dublin, *vice* Mr. Gerard Brown, deceased.—The following appointments were made at the Admiralty on the 20th ult:—Wm. Richardson, Surgeon, and John Mulvany, Assistant-Surgeon, to the *Rosario;* Wm. H. Sisson, Acting Assistant Surgeon (additional), to the *Narcissus.*

APPOINTMENTS FOR THE WEEK.

Wednesday, July 9.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopœdic Hospital, 2 p.m.

NORTH LONDON MEDICAL SOCIETY OF LONDON.—8 p.m.

Thursday, July 10.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

LONDON SURGICAL HOME.—*Operations:* 2 p.m. Ovariotomy; Vaginal Rectocele, Vesico-Vaginal Fistula; Fibrous Tumour of the Uterus.

Friday, July 11.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, July 12.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital, 2 p.m.

Monday, July 14.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, July 15.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

The Dental Review for July. London: J. W. Davies, 54 Princes street.
The Medical Critic. No. VII. London: J. W. Davies.
The Half-Yearly Abstract, from Jan. to June, 1862. London: John Churchill.

NOTICES TO CORRESPONDENTS.

X.—The instruments for the "pulverisation," as it is called, of water consist of a large vessel, with a pumping apparatus in which the air is compressed, and another smaller vessel in connection with it containing the water. The air is forced from the pump through the vessel containing the water. The air and water then pass together through a pipe with a minute nozzle, and are emitted like very fine rain or steam. The water in this condition is said to be "pulverised." The water may of course be medicated.

CHIRURGUS says, "I am gratified at the noble stand you have made on behalf of Kiernan. The Board of Examiners is the *imperium in imperio* of the College, the expressed quintessence of its oligarchical tendencies, and you could not do a greater thing just now than place the liberal-minded and philosophical Kiernan among that body."

F.R.C.S. Eng.—"On the Election of Mr. Kiernan," received.

Mr. B. EVANS.—1st. No.—2nd. No.

Mr. J. H.—The Fever Hospital has, we believe, about seventy beds, quite as many as it is advisable to place under one roof for patients labouring under fever. From a report now before us we find that the mortality among the whole number received, including typhus, typhoid, scarlet fever, and febricula, was 19.5 per cent., or more in detail, 22 per cent. in typhus, 21.15 per cent. in typhoid, and 15.26 per cent. in scarlet fever. We consider this a high mortality. It is higher than the mortality at St. Thomas's, but about the same as that at Guy's. It would be a great help to science if the Registrar-General could obtain for us the mortality among patients treated at their own homes. It must be remembered that the patients at the Fever Hospital are nearly all paupers.

Dr. PRICE is thanked.

W. T.—1st. It may be easily effected.—2nd. Alone, it could be no security.

A SUBSCRIBER.—Your request shall be attended to, and your letter forwarded.

AMICUS.—Dr. Tilt's work would suit you. The third edition has just been published.

BETA.—Declined with thanks. The subject of alcohol as food or poison is worn threadbare. Unless new facts be disclosed, papers upon the subject would be void of interest to the medical reader.

J. E. S.—The suggestion is valuable.

Mr. FRANK COOPER.—The Report of the Junior Medical Society's Meeting is unavoidably postponed to our next number.

SUBURBAN OR COTTAGE HOSPITALS.

To the Editor of the Medical Circular.

SIR,—I had a letter this week from the chief obstetric physician in Australia, thanking me for sundry notes on chloroform, as also some hints on "cottage hospitals" which I think by right belong to the Editor of the MEDICAL CIRCULAR. Notes from the colonies I think are peculiarly valuable, as the Medical men there are pure eclectics, choosing all that is best out of European literature; whereas here our popularity-seeking routinists too often follow some dread pedantry—*i.e.*, bleeding in typhus of the late Dr. Chutterbuck, stoutly upheld by two powerful editors, who also vote for a thousand beds in the new St. Thomas's Hospital; or, again, crotchets in lunacy cases, till the public revolt against lunatic hospitals and "mad doctors" *en masse*, or, again, "free and easy" opposition to special hospitals (two of a trade, &c.) by the most flagrant specialists, or essays on Lord Palmerston as if he were a Dodo.

"I wish you could see our Melbourne Hospital, especially the lying-in department," says my correspondent, "it would delight you or your friend the Editor of the CIRCULAR, whose fame is not unknown under the "Southern cross" in the affair of cottage hospitals; we give every woman a separate room in the hospital for at least a week, and thus can isolate bad cases of erysipelas, &c., and insure quiet to all. The plan answers capitally. I am doing my fourth vesico-vaginal fistula operation this week; these *opprobria* of half a dozen years since, are now easily cured with us, thanks to the indefatigable Baker Brown and chloroform, and what we learn of European successes in that direction." R.T.T.

It will be interesting hereafter to learn the rates of mortality in this Melbourne Hospital where single patients are thus segregated, the Dublin method, where there are about ten in each ward, and the formidable statistics of Paris, where they have arrived at the "bad eminence" of having had the worst and most crowded wards in the world. Such statistics would be suggestive, if not spoiled, by the hard algebraic formulæ or preconceived popular dogmas of the Registrar-General's calculating machines and the apotheosis of routine of the editors who see all wisdom in the classic writings of Chutterbuck, and even still uphold that bleeding is the true remedy for typhus, and a thousand beds all right at the new St. Thomas's Hospital.

There is an hospital atmosphere about an institution of a thousand beds that is most hurtful to patients with slight ailments, their lives, perhaps, balancing between life and death, or a scratch of a lancet, or bistoury, erysipelas or typhus. At any rate, it will be of interest to compare with this an hospital at Melbourne (on your plan) of 50 small rooms for 50 patients, the drainage of the hospital too not over good. Yours, &c., C. K.

June 24.

JOURNAL

OF

Practical Medicine and Surgery.

MEDICAL CORRESPONDENCE.

ART. 6244. MIDWIFERY; THE USE OF THE LEVER.—Sir, I read with much pleasure the account inserted in your April number (Art. 6209), of my memoir on the Use of the Lever for the Extraction of the Head after Expulsion of the Trunk in Breech-Presentations. Although the spelling of my name has undergone in your journal unexpected modifications, I am nevertheless happy that a scientific periodical which enjoys so extensive a circulation as the JOURNAL OF PRACTICAL MEDICINE AND SURGERY, should have invited the attention of the Profession to the utility of the lever, an obstetrical instrument less known in France for its real advantages than for its alleged dangers. Indeed, if the lever was estimated at its proper value, and its use more familiar, I venture to assert that in many instances of tedious labour, it would prove far more serviceable than the forceps.

A practical fact, to which I called attention in 1858, shows the great importance in instrumental labour, of the principle of *pressure*, on which reposes the action of the lever. The forceps, a mere *tractor*, requires the display of much more force for the extrication of the head. In addition to the first advantage consequent on its mode of action, the lever possesses several others, which, after an experience now extending over fourteen years, I may summarize as follows :—

The application of the lever does not require the co-operation of an assistant; it is more speedy than that of the forceps, and more firmly secures the head.

When handled with dexterity, the lever assists the mechanism of natural labour. In those cases especially, in which the diameter from the pubis to the sacrum is diminished, and the head of the fœtus is still retained at the brim, the lever is preferable to the forceps. It then presses downward and backward, that is to say, in a direction parallel to the axis of the brim, diminishes the antero-posterior diameter of the head, and when this portion of the fœtus is admitted into the contracted passage, the instrument enlarges the capacity of the latter by causing distension of the pelvic ligaments.

In many instances of deformity of the pelvis, the lever has brought matters to a successful issue, and facilitated the birth of a living child, when experienced accoucheurs exclusively addicted to the use of the forceps, would have been able to suggest no other resource but craniotomy.

The lever also renders prompt service in face presentations, which so frequently imperil the life of the child; and your readers have been enabled (Art. 6209), to judge of its utility, in those tedious cases in which after the delivery of the body, the head alone remains within the pelvis.

Its intervention is further beneficial in the operation tending to reduce the size of the cephalic extremity. After the extraction of the brain, the cranium can be flattened with the lever, and the use of the saw-forceps and cephalotribe dispensed with.

The lever in use at Ghent consists, as I have stated (*Annales de la Société de Médecine de Gand*, 1858), in a steel blade, thicker and narrower at its base, which is secured in a wooden handle, than at its extremity, where its width is about one inch. The instrument is slightly incurvated on one of its faces, and its entire length is twelve inches.

For the application of the lever, the patient should lie across the bed, the seat brought as forward as possible, and the feet resting on chairs. The bladder being emptied, if necessary, the operator, gently introducing two fingers of the left hand, grasps the anterior labium of the os uteri. The previously greased blade, held in his right hand, is then cautiously inserted between the uterine wall and the fœtal head, the concavity of the instrument being adapted to the convex surface of the cranium. During the pains, the handle of the instrument is raised towards the abdomen of the mother, and the pressure thus brought to bear on the head of the child, causes it to descend in a direction parallel to that of the brim.

I should observe that the curve of the lever should be but slight, if the application has to be made at the inlet. I have known practitioners who rejected the instrument on account of the difficulties they encountered in its application, which they would have been spared had they used a straighter blade.

In its action, the instrument is a lever of the first power; the fulcrum is at some part of the pubic arch; the resistance is supplied by the head, and the power resides in the hand of the surgeon.

The situation of the fulcrum is beneath the pubes, but it is imperatively necessary to avoid pressure of the urethra, and to use but a moderate amount of force. If in difficult and unfrequent cases, it is desirable to exert a considerable amount of power, the part of the blade in contact with the pubes should be padded with India-rubber, in order to avoid inflicting injury on the soft parts.

Before proceeding to the operation, it is absolutely indispensable to ascertain with perfect precision the position of the head. It must, on no account, be forgotten that the lever must be applied to the solid portions of the cranium only—viz., the occiput, temple, or mastoid region. It is not enough to be aware that the head presents; its position must be known with almost mathematical precision.

A few illustrations will clearly show the utility of this precept. In the third or fourth position of the vertex—at the outlet, for instance—were the lever applied beneath the pubic arch, which I do not recommend, the operator would incur the risk, if he used any amount of force, of injuring the eye or face of the child.

A host of other arguments suggest themselves to demonstrate the indispensable necessity of an accurate knowledge of the relative position of the different regions of the head with the various parts of the pelvis.

Let us—*e.g.*, suppose a case of deformed pelvis, the vertex presenting at the brim, the head in general occupying a transverse position. In order to apply the lever properly, the surgeon must ascertain the situation of the occiput, on which the instrument is to bear. Should the occiput be turned towards the left acetabulum, and the operator, by mistake, insert the lever on the right side, the blade may encounter the jaw or even injure seriously the soft parts of the neck.

This is not all: the first effect produced by the lever will be to raise the head from its flexed attitude on the breast, and the mechanism of natural labour will thus be interfered with in an injurious manner.

In presentations of the face, when the chin has already passed down as low as the pubic arch, it would again be obviously dangerous to harbour the thought, that the accoucheur has but to insert the lever beneath the pubes, without taking into account the position of the fœtus.

I am inclined to think that for young practitioners the forceps is the safest instrument, because, as it is in general applied merely on the sides of the pelvis, the application does not, perhaps, require so minutely accurate a knowledge of the position of the head; and an error of diagnosis would not, moreover, entail the same disastrous consequences. But when, after long experience of the forceps, the practitioner has recourse to the lever, he is surprised to find what a small amount of force is necessary to bring matters to a satisfactory conclusion, in cases, which could not have been managed without considerable tractive efforts had the forceps been used.

The forceps is, without doubt, a most useful instrument, indeed, the very best, when the head presents at the outlet, and its long diameter corresponds with the conjugate diameter of the pelvis, but when its situation is very oblique in the true pelvis or at the outlet, it cannot, as all practitioners are aware, be extricated without a considerable amount of force.

The lever permits the accoucheur to dispense with this great display of power, obeys the guidance of the surgeon's hand with readiness, and imparts to the head movements similar to those which take place in natural labour. In the instance alluded to, the first effect of the lever is to complete the

rotary evolution of the head, as it would be accomplished by nature, and once the presentation has been rectified, a very slight effort will, in general, be sufficient to extricate the child completely.

Ch. Coppee, M.D.
Assistant-Physician to the Civil Hospital, Ghent.

SCIENTIFIC MISCELLANEA.

Art. 6245. Combined Use of the Perforator and Lever in Craniotomy.—As an illustration of the concluding remarks of the above communication, we adduce a brief summary of an operation of craniotomy, performed on the 3rd of June, 1861, by our learned correspondent.

The patient was a primipara, whose pelvis was irregular and contracted. The child had ceased to live, and its head, movable above the brim, presented in an almost transverse direction, the occiput being turned towards the left acetabulum. Professor Van-Huevel's saw-forceps having been unavailingly resorted to, Dr. Coppée and another surgeon, Mr. Coghen, agreed that perforation of the head was the only resource.

Mr. Coppée had with him a new perforator, presented last year to the Society of Medicine of Ghent, by Mr. Frederich. This instrument consists in a kind of trephine, which is calculated to remove, by circular rotation, a piece of the cranial bones. The contrivance appears, by its small size and its simple mechanism, preferable to all those hitherto in use. All that is expected from a perforator however, is, as Mr. Coppée remarks, that it should effect an opening of sufficient extent to allow of easy escape of the cerebral substance. In cases of this description, the management of which is extremely arduous, the lever is most serviceable. It is perfectly adapted to the removal of the contents of the head, and to the flattening of the bones. When the perforator has broken down the brain, and the lever is applied to the surface of the cranium, the least pressure is sufficient to cause the cerebral substance to flow out, the bones yield and collapse, so as to adapt themselves to the dimensions of the contracted passage, and unless the constriction of the pelvis is excessive, delivery can be effected with this appliance.

In the case before us, the lever was found useful to keep the head steady, and thus much assisted the operator, craniotomy being always a delicate, and sometimes even a dangerous procedure, on account of the mobility of the surface acted on by the instrument. The aperture was here performed at the posterior fontanel, and the perforator was then moved about within the cranium, in order to break down the brain. After the conclusion of this first stage of the operation, the very first efforts of the lever caused the cerebral mass to escape in totality, and the head and body were soon afterwards, though not without difficulty, delivered. The cranium was found perfectly empty, and the skull was entirely flattened down at the basis and at the summit.

The mother recovered as if the case had been one of natural labour.

This instance shows that the pelvic deformity may sometimes be so considerable as to prevent the possibility of the application of the common forceps, or of Professor Van Huevel's saw-forceps, and likewise of the cephalotribe in use in France. In this emergency, the perforator must be resorted to, and the lever greatly assists in steadying the head, and in pressing upon the skull during and after the escape of the contents of that cavity.

Art. 6246. Treatment of Aneurism of the Extremities by Flexion of the Limb.—In the *Annales de la Société Médico-Chirurgicale de Liège*, Dr. O. Ansiaux reviews an interesting memoir of Mr. E. Hart, Surgeon to the West London Hospital, on the radical cure of aneurism by flexion of the extremities. Assuming, as a starting point, that forcible flexion of the forearm retards and almost entirely interrupts the circulation in the radial artery; that, moreover, in the wounds of the palmar arch, this method is also most efficient in checking the hæmorrhage, Mr. Hart conceived the happy idea of applying these well-known facts to the treatment of aneurism of the limbs, and in 1859 already thus effected a cure in a case of popliteal aneurism. On the 28th of January last, he related to the Royal Medical and Chirurgical Society several instances of the same kind which had fallen under his own observation, or that of other surgeons. Nine aneurisms have now been cured in this manner, seven of which are recorded in Mr. Hart's recent communication.

All, with one exception, are instances of popliteal aneurism; the seventh is a case of traumatic injury of the radial artery. Pressure was, in three patients, resorted to, in addition to flexion, but in four, flexion alone was employed. Among the latter, the most interesting case is that communicated to Mr. Hart by Mr. James Spence, of Edinburgh. In this instance, popliteal aneurism had relapsed after ligature of the superficial femoral artery; compression was then unavailingly resorted to for a period of five months. Mr. Spence had recourse to flexion of the leg upon the thigh, and in the space of a fortnight the tumour became more solid, and the throbbing almost entirely ceased. In a month from the beginning of the treatment, a cure was effected.

Mr. Hart relates another remarkable case, which came under his own observation. The patient was also affected with popliteal aneurism; the pulsations were immediately arrested by the flexed attitude, and in six days the cure was complete. As a precautionary measure, flexion was persevered in for another week. When it is considered advisable to have recourse to this method, it is necessary to apply a roller over the entire limb, in order to give support to the superficial veins, and rest to the contracted muscles. To obviate stiffness, and diminish the pain, which is, however, less distressing than when compression is employed, a plan often requiring instrumental appliances, it is proper to perform inunctions with chloroform and oil on the knee and thigh. The limb is then secured in a fixed attitude, and the patient is permitted to exercise and walk with crutches. Sleep in general is not disturbed; the flexion must be employed with care, and gradually increased every day.

Forcible flexion, as a mode of treatment of aneurism, is preferable to compression, inasmuch as it requires neither instruments nor assistants. It is not liable to induce ulceration of the skin, erysipelas, or varicose aneurism, as in a case reported by Mr. Oliver Pemberton. Should the method fail, it will at least have promoted the development of collateral circulation, and for these reasons, as well as for its great simplicity, it is well deserving of a trial.

Art. 6247. Inversion of the Body in the Reduction of Hernia.—Dr. Priou publishes, under the denomination of 'A New Method for the Reduction of Incarcerated Hernia,' an article in the *Revue de Thérapeutique Chirurgicale*, from which we extract the following passages:

"I was recently summoned in three cases of strangulated hernia, which had resisted all attempts at reduction, and the surgeons were about to proceed to the use of the knife, when I was fortunately enabled to avert this undesirable alternative, by adopting a plan that suddenly occurred to me, and which I now communicate to the profession.

"I proceeded as follows:

"Climbing on the bed, on which the patient was horizontally stretched, and placing myself between his legs, I seized them under the knees, and raised them in such a manner as to elevate the pelvis as much as possible, and completely invert the body. At the same time an assistant was directed to press the extruded intestine downwards through the ring, whilst I imparted gentle succussion to the body, in order to direct the viscera towards the diaphragm, which, by the inversion of the trunk, had become the most dependent portion of the abdominal cavity.

"This method is well calculated to facilitate the dislodgment of the incarcerated intestine from the inguinal canal."

This procedure is not a new one. Many years ago Amussat laid down the precept of proceeding to the reduction of hernia only after placing the patient in such an attitude that the weight of the intestines might contribute to their return into the abdomen. In 1844, Dr. Hirigoyen, then clinical clerk at the Hospital Saint André, at Bordeaux, carried out Amussat's

precept in the very fullest manner, and succeeded in two cases, which we recorded at the time in the present journal (Art. 2724). The patient's legs were placed on the shoulders of a vigorous man who grasped them in his hands, and the patient, thus lying in an inverted position, the viscera descended towards the diaphragm. Reduction was effected without difficulty.

The procedure adopted by Mr. Hirigoyen closely resembles that now advocated by Mr. Priou; both are equally commendable, and repose on the same rational principles. Were we, however, compelled to make a selection between the two, we should be inclined to give the preference to Mr. Hirigoyen's method, which relieves the surgeon from the coarser details of the operation, and enables him to bestow all his attention on the taxis.

Art. 6248. Mortality among Children put out to Nurse by the Administration of Hospitals in the Departments of La Seine and La Gironde.—From the statistics recently published by Mr. Le Barillier, a physician attached to the hospitals of Bordeaux, of 6,178 children admitted into the Special Asylum of that city, from January 1, 1850, to December 31, 1861—*i. e.*, in a period of twelve years, 2,131 died in the course of their first year—viz., 1,083 in the institution, and 1,048 at the homes of the country people to whose care they had been confided. These figures, representing a mortality of 33 per cent., contrast advantageously with the average mortality of foundlings, in the Département de la Seine—viz., 55 per cent., as stated before the Academy of Sciences by Mr. Bouchut in his last paper.

Mr. Le Barillier inquires into the cause of this difference, and conceives that it resides in the more attentive supervision exercised by the Medical Inspectors in the Département de la Gironde, serious diseases being, in consequence, checked at an early stage of their development, and the children better cared for. It is but fair to add that, with respect to hereditary syphilis, the infants are placed in more favourable conditions than the Paris foundlings. In the Seine, the mortality of nurslings put out to nurse by the administration is, for the first year, 55 per cent., but it reaches 29 per cent. only for children intrusted to women in the country by parents belonging to the middle classes, a result which, in Mr. Bouchut's opinion, depends on the greater liability to hereditary syphilis of illegitimate infants, who, by the depravity of their parents, are doomed, even before their birth, to casualties of the worst description.

Art. 6249. Ammonia in Capsular Cataract.—The following case, illustrative of the curative action of ammonia in certain forms of cataract, is recorded in the *Giornale d'Oftalmologia Italiana*, and reprinted in the *Gazette Médicale de Lyon:*

A woman, aged twenty-two, having observed a diminution of her visual power, and alarmed at the idea of cataract, with which her mother, two of her brothers, and a sister, had been affected in succession, consulted Mr. Quadri, who had already couched the lens in the case of her sister. The surgeon discerned, with the ophthalmoscope, capsular opacity, more marked at the circumference than at the centre of the lens; vision was so weakened that the patient was unable to pursue any occupation.

The treatment consisted in the daily application of liquor ammoniæ to the temples beneath a watch glass, and in the internal exhibition of a grain of muriate of ammonia, every day.

The patient persevered in this medication with a remarkable degree of docility, and at the expiration of two months, her sight was sufficiently improved to admit of her resuming partially her usual avocations, and a diminution of the extent and intensity of the opacity was ascertained, by inspection with the opthalmoscope, to have taken place.

The treatment was continued for five years, with considerable amelioration of the state of the eyes. Mr. Quadri further remarks that after an interruption of a month in the remedial measures, an aggravation was observed, which has since yielded to the application of ammonia.

PRESCRIPTIONS AND FORMULAS.

Art. 6250. Local Application for the Cure of Tinea Sycosis.—Mr. Bouchardat's *Annuaire Thérapeutique* for the year 1862 (*a*), amongst other important formulas, mentions an application which Mr. Decondé has used with success for the destruction of the fungus (*Microsporon mentagrophytes*) which causes sycosis. Its efficacy appears unquestionable. The following is its composition:

Crystallised acetate of lead, ℥j.
Thick cream, ℥jss.

Reduce the acetate to a fine powder; mix. The diseased parts should be covered at night with this compound, which renders depilation unnecessary, the salt of lead penetrating readily to the skin, and destroying the parasitic growth.

Art. 6251. Influenza; Spasmodic Cough; Infusion of Wild Thyme.—Mr. Cazin, in his treatise on the *Indigenous Medicinal Flora*, states that wild thyme is not less beneficial in *humid asthma* and *chronic catarrh*, than hyssop, ground-ivy, and other plants of the same class. Capuron recommended the infusion of wild thyme in hooping-cough; it is not, therefore, a new medicinal agent, but its virtues had been forgotten. The oblivion into which it has fallen is, according to the *France Médicale*, much to be regretted; Dr. Joset asserts, in a paper recently published in the columns of that periodical, that a sweetened infusion of wild thyme, containing a small quantity of gum arabic, has relieved and sometimes even *cured*, as it were by magic, hooping-cough at all stages of its evolution. The author further declares that similar good effects have been induced in laryngismus stridulus, spasmodic and convulsive cough, etc.

The preparation chiefly recommended by Dr. Joset is an infusion of half an ounce of wild thyme in two pints of boiling water. This tisane should be strained, sweetened, and taken at will.

Art. 6252. Chloroform in Hooping-Cough.—Dr. Jacquard, of Tourcoing, formerly attached as house-surgeon to Mr. Roger's wards at the hospital for Infancy, has recently recorded, in the *Gazette Médicale*, several cases of hooping-cough, treated in 1860 and 1861, by the exhibition of chloroform. Dr. Roger, who, doubtless, has not the same confidence as Dr. Joset in the efficacy of wild thyme, has tested in this obstinate affection, the curative power of chloroform internally, with the following results:

Diminution of the frequency of the paroxysms.

Less usually, but sometimes however, simultaneous decrease of their violence.

Occasionally, an abatement of the intensity of the fits of spasmodic cough, without any change in the frequency of their return.

Chloroform failed in shortening the duration of the disease, like all the other remedies which have heretofore been resorted to, not excepting belladonna. It is, therefore, at most, a useful palliative.

The doses prescribed by Mr. Roger to infants vary from 6 to 30 drops daily in a 4-oz. gum mixture.

(*a*) One vol. in thirty-twos. Germer Baillière, Paris.

Death from Chloroform.—A death arising from the adminstration of chloroform took place on Saturday last at the United Hospital, Bath, during the performance of an operation for the removal of a tumour on the lower jaw of a widow named Susan Harrison, aged forty. At the inquest it appeared, as the result of post-mortem examination, that deceased had suffered from fatty degeneration of the heart.

Terrible Encounter.—On Tuesday morning a fearful fight took place between a bull and a stallion, at Lynn, both being the property of Mr. James Corken. It appears that the animals were grazing in a field near the Chase, and early in the morning they engaged in deadly combat, from which they could not be parted. The sight is described by an eye witness as most appalling, both animals tearing up the earth and making the air reverberate with their hideous noises. It was soon found that the struggle would be fatal to one if not both of the combatants. At length the bull became the victor, the horse, which was worth 60*l.* dropping down dead. The horse was frightfully injured, the bull's horns having made several large holes in his body.

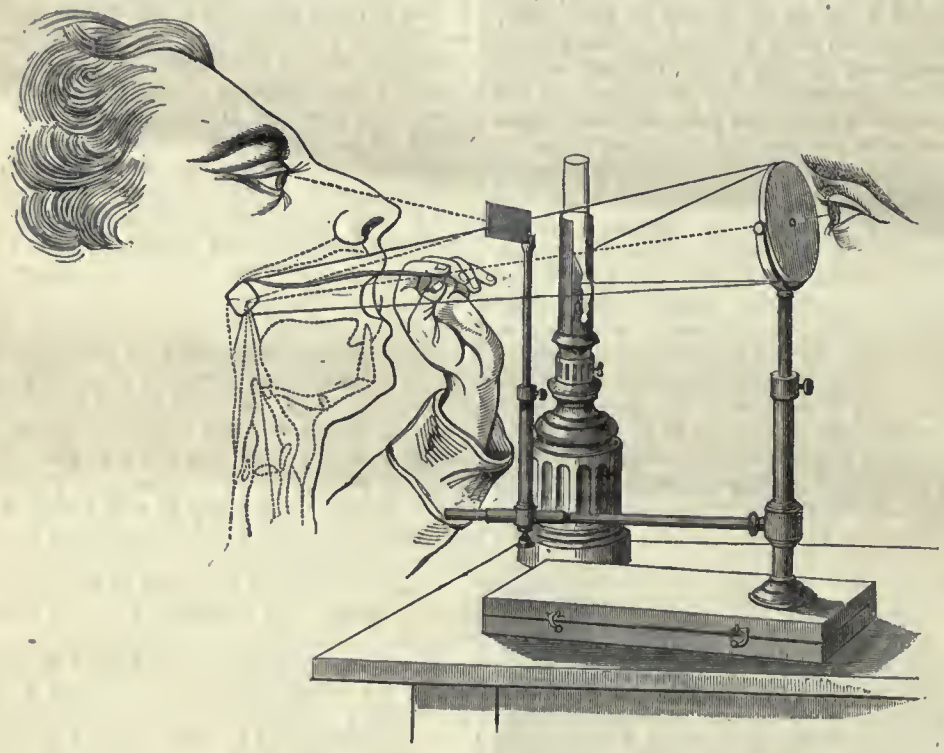
The Medical Circular.

THE HISTORY OF THE LARYNGOSCOPE.

By JAMES YEARSLEY, Esq.,
Surgeon to the Metropolitan Ear Infirmary, Sackville street.

(Continued from page 24.)

The accompanying sketch is a representation of the apparatus devised by Dr. Czermak for demonstration upon himself—auto-laryngoscopy. It tells its own tale, requiring but little verbal description. Owing to the different visual axes of the two observers, the eye of the one looking through the concave illuminating mirror does not see all that the operator who is examining himself sees. The observer of himself will always see more of the parts situated behind—the spectator, those situated before; but much will be seen by both simultaneously. But the demonstration need not be limited to two persons. Others can place themselves either behind the operator, and with him look into the quadrangular mirror, or arrange themselves at the side of the observer who is looking through the central hole of the illuminating mirror.



The diseased conditions of the throat, for the elucidation of which the laryngoscope is required, are mostly of a chronic kind. Practically speaking, therefore, it is not of such great moment that your first, second, or third attempt at examination should fail. It is satisfactory to know that by patience and perseverance you are ultimately sure to succeed. My own experience already enables me to speak with confidence on this point.

Having recorded in previous papers my opinions of the advantages we may be expected to derive from laryngoscopy in practice, after having traced its history, which was the principal object I had in view in writing upon the subject, it only remains for me to pass in review some of the results which have accrued in the practice of others, reserving for a future period a detail of my own experience, observing only here, that already it enables me to confirm the possibility of effecting all that has been claimed for the method by Czermak, Turck, and their followers.

Czermak and Turck—the reader of these papers must have observed how frequently these names are associated. It has been in some measure with me, as it was with Czermak, in coupling the names of Liston and Garcia, to whom he ascribes the merit of making known the *principle* of the treatment, not knowing to which to give the palm. So, with himself and Turck—the latter was the first manipulator, but failed, or, if not failed, lost confidence in the method, and handed it over to Czermak, who undoubtedly succeeded—not only succeeded, but was the first to put pen to paper in favour of the method, and give proofs of its value by the relation of seven cases. These seven cases, he says, "form the *first series* of observations which have well established the practical advantages of the methods of Liston and Garcia." Let me enumerate the morbid conditions found to exist in these and many more cases subsequently examined.

Case 1.—Complete obstruction of the larynx by two tumours springing from the mucous membrane beneath the free border of the vocal cords, the result of scrofulous infiltration, and necessitating laryngotomy, in a young girl eighteen years of age, of lymphatic temperament, middling size, and robust constitution. Up to seven years of age she enjoyed perfect health, she was then seized with bronchitis, which persisted during a whole year. In the spring of 1858, the sub-maxillary glands became considerably enlarged and soon were developed into a series of scrofulous sores. The larynx began to swell in the month of April, though there was but little tenderness on pressure. There was neither redness nor swelling of the pharynx, no fever, the voice, habitually weak, was reduced to a whisper. Eventually, the swelling of the larynx subsided, and assumed its natural position and size. Nevertheless, the hoarseness continued, and by degrees she entirely lost her voice.

In the month of September, the patient began to suffer from difficulty of breathing; both inspiration and expiration became sonorous, and at night her loud snoring interfered with the sleep of her friends.

From the 24th of September, the dyspnœa had so increased as to render the state of the patient critical. The larynx was now painful on pressure; sleep was impossible in consequence of the sense of oppression. On the 4th of October, a suffocative attack, which lasted several hours, confirmed Dr. Porges in the opinion he had for some time entertained of the absolute necessity of laryngotomy. This operation was performed on the 5th of October, by Professor Balassa, whilst the patient was so near death that artificial respiration was necessary to keep her alive. Since that time she has gone on tolerably well, but the larynx is completely closed, this was readily shown by stopping up the external aperture of the canula, through which she breathed.

The value of laryngoscopy was doubly shewn in this case, for by its aid an examination of the condition of the glottis was made, from above and from below, by which the nature of the disorganisation was fully made out. The case is graphically narrated by Dr. Czermak, in his work 'Du Laryngoscope et de son emploi en Physiologie, et en Medicine,' 1860.

Case 2.—Polypus attached to the right vocal cord, giving rise to constant hoarseness, supposed to be nervous.

Case 3.—Ulcers of hard and soft palate, with considerable loss of substance, involving nearly all the uvula. Hoarseness; great swelling of the epiglottis, which is injected and ulcerated, with a mucous patch on its right side, giving it a trilobed form. Constriction of the larynx, dyspnœa, laryngotomy. Recovery, with restoration of the voice.

Case 4.—Cicatrices and loss of substance of the larynx, causing

incurable aphonia; destruction of the epiglottis, and part of the velum palati, from old syphilitic disease.

Case 5.—Retraction of the right inferior vocal cord, with swelling of the superior vocal cord of the same side, producing loss of voice, from syphilis.

Case 6.—Partial destruction of the epiglottis, with considerable swelling of the false vocal cords; hoarseness degenerating into aphonia; congenital fissure of the velum. Inspection of the entire trachea, down to the bifurcation.

Case 7.—Aphonia for eight months; constriction and insufficiency of the glottis; swelling and infiltration of the mucous membrane of the arytenoid cartilages; obliteration of the ventricles of Morgagni; direct cauterization of the affected parts by the aid of the largyngoscope; formation of white eschars.

Case 8.—Hoarseness bordering on aphonia, associated with severe pain in the windpipe; application of glycerine within the larynx.

Case 9.—Syphilitic ulcer of the lower lip; pain in the larynx, with redness and a small ulcer; cauterization with the solid nitrate of silver; an attack of hæmoptysis.

Case 10.—Redness and swelling of the superior vocal cords; with a circumscribed inflammation at the point of insertion of the four vocal cords.

Case 11.—Tubercles on the right vocal cord, and in the mucous membrane between the arytenoid cartilages; cushion of the epiglottis very prominent.

Case 12.—Constant difficulty of breathing, supposed to depend upon some obstacle in the larynx; negative results afforded by the laryngoscope.

Case 13.—Transformation of the left superior vocal cord into a hard, rough, and ulcerated tumour, producing constriction of the glottis and dyspnœa.

Case 14.—Cauliflower excrescences upon the posterior walls of the pharynx, covering and obstructing the larynx.

Case 15.—Minute condylomata upon the edges of the glottis, producing hoarseness and aphonia.

Case 16.—Conical excrescence upon the inferior vocal cord, with thickening, producing hoarseness; believed to be syphilitic.

Case 17.—Accidental growth beneath the angle of insertion of the vocal cords, and above the right superior vocal cord.

Case 18.—Polypus on the left inferior vocal cord, causing very slight hoarseness.

Case 19.—Large epithelial muriform polypus, developed within and above the glottis.

Case 20.—Œdema of the glottis.

Details of all these cases are given in the work already referred to, and are well worth the reader's attention. Several additional cases have been of late notified in the English journals as coming under the examination of Dr. Czermak during his recent visit to this country. In my own practice we have conjointly investigated the condition of several patients with more or less success; two of these I am now treating with advantages which I owe entirely to laryngoscopy.

I may, therefore, conscientiously conclude my notice of laryngoscopy by endorsing the opinion of Czermak—that precision and accuracy of diagnosis will permit in many cases of the employment of rational means of local treatment, and that the pathology and treatment of laryngeal affections, where laryngoscopy can be applied, are on the point of making unexpected progress.

HOSPITAL REPORTS.

ST. GEORGE'S.

EMBOLON OF THE FEMORAL ARTERY, CAUSING FATAL GANGRENE OF THE FOOT.—DR. PITMAN, MR. PRESCOTT HEWITT.

The patient, a man about fifty-five or fifty-six years of age, was admitted in last November, under the care of Dr. Fitman, in consequence of an attack of dropsy arising from disease of the heart. He was getting well, however, and was able to walk about the ward.

On the 17th of December he was seized with violent pain in the left groin, and the leg on that side became perfectly powerless, cold, and numb, and he was in great pain during the remainder of the day and that night. On the following day he was seen by Mr. Hewitt, at the request of Dr. Pitman. He was still suffering great pain, especially in the groin. The limb was lower in temperature than the rest of the body, and there were patches of discoloration extending over the dorsum of the foot and toes, with some degree of œdema; the leg was red and inflamed-looking to about midway between the ankle and knee.

On examining the groin at the spot where the patient had first felt the pain, a hard round substance was felt; it was about three-quarters of an inch in length, and rolled under the finger. Its position was exactly in the course of the femoral artery, about two inches below Poupart's ligament. As the patient was very thin, there was no difficulty in making out its size and form, and it was at once pronounced to be a plug of lymph in the artery. Above the plug pulsation could be distinctly felt, but below it there was no pulsation whatever in any of the vessels of the limb. The general appearance of the patient was unhealthy, and his skin had a yellow tinge, his countenance sunken and anxious, pulse intermittent and feeble, heart's action intermittent and weak, but no valvular disease could be discovered.

The limb was wrapped in cotton wool, and an embrocation of compound soap liniment was rubbed into the groin. To relieve the pain, morphia was given, and stimulants to support the vital powers. Notwithstanding, however, gangrene commenced in the toes, and spread slowly through the foot. The toes became black and dry, and the œdema and redness of the leg much increased. The patient's strength failed gradually, but the gangrene appeared to have ceased after having involved about two-thirds of the foot. Death relieved the unfortunate patient of further suffering, on the 23rd of January, only a few days after the line of demarcation had formed, the vital powers of his constitution being unequal to hold out any longer against the force of the disease. Had there been more vigour in his constitution, an operation would have been performed after the establishment of the line of demarcation; but, considering his low condition, it was not thought advisable to interfere.

Upon a post-mortem examination, it was found that the plug was situated in the upper part of the superficial femoral artery, at the origin of the deep femoral; the surrounding tissues were much thickened, and the artery was firmly adherent to its sheath, and also to the vein. The plug was adherent to the inner coat of the vessel. It had a rusty appearance on the surface, but of a fawn colour in its interior. It strongly resembled the fibrinous layers of an aneurism. The heart was large and flabby, but there was no endocarditis, no disease of the valves; several large masses of fibrin, however, were found entangled in the fleshy columns of the left ventricle—they were mostly of a fawn colour, very firm, and apparently of long standing. A large mass of fibrin was also found in the left auricular appendix, and partly projecting into the auricle. There were also several loose coagula, of recent formation, particularly in the right ventricle. The large vessels were all apparently healthy. The lungs were inflamed at their bases. There was a large mass of fibrin at the upper, and another at the lower, part of the spleen; they were of deep yellow colour, and firm in texture; the arteries leading to them were also found blocked up with fibrin. The other viscera were in a healthy condition.

Mr. Hewitt remarked that this case offered several interesting points for consideration. What led to the conclusion that the case was one of embolism, was the gangrene of the foot, and œdema and redness of the leg, which showed that there was obstruction of the arterial system in the upper part of the limb. Then, on examination of the part where the pain was first felt, the hard substance felt in the course of the artery, taken in conjunction with the cessation of pulsation below that point, while it still existed above, showed that the vessel was plugged. As to the cause of the plugging, the sudden pain, and loss of sensation and power in the limb, indicated that the plug had, in all probability, come from the heart.

The progress of the case proved that it was not owing to arteritis, as the inflammation followed the plugging instead of preceding it, which would have been the case had the plug originated in the vessel, and also that the man had lived thirty-seven days after the plugging took place.

Mr. Hewitt considered the question of amputation in such cases a very important one. In this instance it was abandoned, in consequence af the man's low condition which precluded all hope of a successful result. As a general rule he considered amputation quite useless where embolism existed high up with obstruction, until after the establishment of the line of demarcation.

But in a case of rapidly advancing gangrene where the plug was at a sufficient distance from the trunk to admit of the removal of the limb above that point, he thought amputation would be proper, as the only chance of saving the life of the patient.

ANNUAL MEETING OF THE ASSOCIATION OF MEDICAL OFFICERS OF ASYLUMS AND HOSPITALS FOR THE INSANE, HELD IN THE LIBRARY OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON,

On Thursday, July 3, 1862.

Present—Dr. John Kirkman (*President*), Suffolk; Dr. J. L. Robertson (*General Secretary*); Dr. Caleb Williams, York; Dr. Ross, Hants; Dr. Harrington Tuke, Chiswick; Dr. T. B. Christie, Pembroke House; Dr. Andrew Wynter; Mr. J. Gustavus Symes, Dorset County Asylum; Mr. John Warwick; Dr. W. Wood, Harley street; Mr. R. H. Sankey, Oxford Asylum; Dr. Salomon; Dr. Fayrer; Dr. Sibbald; Dr. Mundy; Dr. Monro; Dr. Davey; Dr. William Kirkman, County Cumberland Asylum; Dr. Henry H. Stewart, Government Asylum, Lucan, County Dublin; Dr. Corsellis; Dr. Wing, Northampton General Asylum; Dr. Paul, Camberwell House; Dr. Campbell, Essex Asylum; Dr. David Mackintosh; Dr. Boyd, County Somerset Asylum; Dr. Jacobs, Hoxton House; Dr. Bucknill, County Devon Asylum; Mr. E. Toller, St. Luke's Hospital; Dr. Stillwell; Dr. E. S. Willett, Wyke House; Dr. Fox,

Brislington; Dr. E. Sheppard, Colney Hatch Asylum; Mr. Brushfield, Chester; Dr. Gilchrist, Dumfries Asylum; Dr. James Rorie, Dundee Asylum; Mr. Lowry; Dr. Burnett, Alton, Hants.

The General Secretary (Dr. C. L. Robertson, Hayward's Heath Asylum), read a letter from the President for 1861–62 (Dr. Lalor, of the Richmond D.L.A., Dublin), expressing his extreme regret at his inability—on account of official engagements—to attend the meeting, and resigning his chair to his successors,

Dr. Kirkman, County Suffolk Asylum, thereupon read his "Opening Address," in which, amongst other things, he alluded to the unwarrantable interference with the Resident Physicians on the part of visiting justices—an annoyance which, however, he had never himself, during the thirty-one years since his appointment to the Medical superintendence of the Suffolk Asylum, experienced on one single occasion. He warned his brother Medical superintendents against devoting their energies to so superlative a degree to the duties of their post as to injure their health, and thus acting unjustly to themselves, while thinking that they were only acting conscientiously towards the public. He said he hoped the day was not far distant when Medical superintendents would be able to *demand* as a *right* the retiring allowance at the end of fifteen, or, at the most, twenty years' service which they now (with difficulty sometimes) obtain after the expiration of a period of service equal to forty years of *ordinary* public employment. The President, after saying that he had not in his address attempted to open up any new avenues, but had merely led his audience a few steps along the old beaten path, sat down amid loud applause.

Dr. Bucknill proposed a vote of thanks to the President, for his able and instructive address.

The motion was seconded by Dr. Munro, who said that he was not quite sure that he was justified in offering any remarks at all, for he feared he was not likely to be in good odour with the most of those present on account of his being one of the unfortunate *Visiting* Physicians. Dr. M. said that he hoped that he would be enabled to attend many future meetings of the Society, and would be glad to be of service to them in any way in his power. He had been enabled this year, as a Censor of the College of Physicians, to procure for the Association the use of the room in which the meeting was held, and would feel most happy in using a similar influence on any future occasion.

The Secretary read portions of a letter he had received from the Treasurer, Mr. Lee, which was accompanied by a statement of the accounts of the Association, which showed a balance of 61*l.* to its credit. Dr. Robertson explained that the reason why the balance was this year so much below that of last year (80*l.*) was, because the Committee had this year thought it right to deal with a small sum—which never heretofore had been so allocated—to refunding the Editor of the Journal for several expenses which he had previously always paid out of his own pocket.

Dr. Robertson, in proposing the adoption of the Treasurer's report, alluded to the fact that seven defaulters (three being in the return from Ireland) had rendered themselves liable to have their names struck off the list of members. He wished to have the opinion of the meeting with regard to the expediency of carrying out to its full extent the law regarding defaulters.

Dr. Campbell—after several members had asked the Secretary questions with regard to the defaulters having been duly noticed—said, he thought there was no use in having laws at all if they were not to be acted upon, and would therefore feel inclined to move an amendment, giving directions to the Secretary to strike off the names of the defaulters from the list of members.

Dr. Woods proposed an amendment (which, however, was afterwards withdrawn), in which an opinion differing from that of Dr. Campbell was expressed.

It was finally agreed that the Secretary should receive directions to write separately to each of the seven defaulters, and acquaint them that, in case their subscriptions were not paid before the 4th of August, their names would be struck off the list of members.

The Secretary stated that, in accordance with custom, the Committee had agreed upon the names of two members for recommendation to the Association for election to the Presidential chair. The Committee had accordingly agreed to bring before the Association the names of Dr. Tuke and Dr. Skae.

The President was about to take the votes of the members in the usual way (by the holding up of hands), when Dr. Davey (superintendent of a provincial asylum at North Woods) proposed that the voting should be by ballot. Thereupon Dr. Tuke rose and said he would be sorry that the fact of his being present and Dr. Skae being absent should be the cause of the Association departing from its usual custom. He felt confident that there was not the slightest chance of the choice of the meeting falling upon Dr. Skae, and only feared that such a happy choice might be prevented by members not liking in his presence to vote for his opponent. He begged to assure them that he would not feel aught but satisfaction himself in case the majority was for Dr. Skae; so that there need be no delicacy on the part of any present with regard to the voting for his opponent because he happened to be present.

It was finally, however, agreed to adopt the proposal of Dr. Davey. The bowl which the College of Physicians, through Dr. Munro, kindly placed at the service of the Association, was accordingly sent round, when there appeared for

Dr. Skae	19	votes.
Dr. Tuke	13	"

The President thereupon declared Dr. Skae to be the President-elect for 1863-64.

Mr. Lee was unanimously re-elected Treasurer of the Association.

Dr. Bucknill was unanimously re-elected Editor of the Association Journal; and, in returning thanks to the meeting for this proof of their renewed confidence, Dr. B. alluded to a resolution passed at a previous meeting with regard to the allocation of a portion of the Balance funds to the payment of expenses connected with the sub-editorship of the journal. He now proposed to appoint regularly a junior to do this work in the position of sub-editor of the journal. He had already the authority to do so, but thought it only right to mention the fact thus publicly before he actually made the appointment. The General Secretary, Dr. Robertson; the Secretary for Scotland, Dr. Rorie; the Secretary for Ireland, Dr. R. Steward; re-elected unanimously.

Dr. Robertson said, that there was an inclination on the part of the Committee to recommend the Association not to elect any honorary members this year. Thirteen new members (ordinary) were then elected, amongst whom were the following:—Dr. Mundy, of Moravia; Mr. Harper, Chester; Mr. Gideon Geo. Gardner, Brooke-house; Mr. T. C. Coulson, Mr. Jacobs, Hoxton house, Middlesex; Dr. Eastwood, Fairford Retreat, Bristol; Mr. Duckworth Williams; Dr. J. F. Duncan, Dublin; Mr. Mold.

Dr. Davey, at this stage of the proceedings gave notice that at the London Meeting in 1863, he would propose a change in the law with regard to the nomination of candidates for the office of President of the Association, believing as he did that the operation of the present law tended towards the handing over to the few (meaning the Committee), the election which should be in the hands of the many.

Dr. Mundy (of Moravia), then commenced the reading with so foreign an accent as to be scarcely intelligible at the other end of the room, his paper on the Cottage system. The latter part of the paper was read by the Secretary, Dr. Robertson at the request of many who were unable to distinguish what the Moravian Doctor was endeavouring to communicate.

A warm discussion with regard to the advantages and disadvantages of the Cottage system ensued, in which Mr. Warwick, Dr. Sibbald, Dr. Bucknill, Dr. William Kirkman, and others took part.

Dr. Bucknill said, he had prepared a paper on "The modes of Death among the Insane," but as the hour was so far advanced he would confine himself to a few remarks regarding the phraseology generally adopted by Medical superintendents of Asylums in their Obituary tables when stating the *causes* of death. He thought there were very many of the terms used very objectionable. Amongst these were the term "Death from Exhaustion." He thought the term "Decay" was equally wrong—as being to vague if used without a prefix.

A discussion ensued, in which Dr. Caleb Williams and Dr. Davey took part. The latter thought the difficulty (or a great part of it at least) would be bridged over by the division of the causes of death into two classes, "proximate" and "remote."

The only other papers which it was intended should be read at the meeting were those by Mr. Maunsell and Dr. Robertson.

The latter confined himself (on account of the lateness of the hour at which the previous discussion concluded) to merely bringing before the meeting a plan of a portion of his asylum which had been manured by means of the sewage of the institution alone, which plan he said he had brought the engineer (who had made it) up to the room to explain more fully in detail than he could to any gentleman who wished to go more deeply into the subject than the limited time at his disposal permitted him to do.

He contented himself with merely stating one or two facts with regard to the effect of the application to the land in question of the sewage in the improvement of the crops taken off it. The result of the first six months' application was, that he was enabled to feed twenty cows off four acres!

He should not omit, he said, to mention, that the first day the cows were put on the grass, they refused to eat it; but after a night's fast they became less suspicious and have never thrived better, nor given better, or a larger quantity of milk, than they have since. He received in the first week of May, 14*l.* per acre for grass off the land thus manured.

An animated and very lengthened discussion followed Dr. Robertson's remarks. Amongst those who took prominent part in the debate were Dr. Campbell, Dr. Hitchman, Dr. W. Kirkman, and Dr. Sar, one of the Medical Officers of the Oxford County Asylum, the two former entirely disapproving of such an application of the sewage, as being more expensive than the authorities would, as a general rule countenance, and as being inapplicable to any land in which there was not a gradual fall; the two latter, on the other hand, supporting the views of Dr. Robertson, as to the great advan-

tage in a pecuniary point of view of turning the sewage of asylums to profitable account.

Mr. Warwick brought before the meeting an act of injustice (as he thought it) on the part of the lunacy commissioners, who refused him (although he had had seventeen years experience in the treatment of insanity), a license for a new metropolitan private asylum. He said, he could not imagine any cause for this refusal, except, perhaps, it could be found in the fact—as stated to him by a friend—that the commissioners were anxious to lessen the number of *metropolitan* private asylums. He said he thought it was strange that he (who was fully qualified as a medical practitioner) should be refused a license, when he was told by their own (the commissioner) chairman, Lord Shaftesbury, that they had the greatest abhorrence of the "licensed houses" of the metropolis. Mr. Warwick concluded a lengthy statement, by moving that a sub-committee be appointed to inquire into the conduct of the commissioners with regard to the licensing of metropolitan private asylums. He said, all he asked, was that the owners of metropolitan private asylums should be placed on a level with their more favoured brethren in the metropolis. He would have the sub-committee, if necessary, petition parliament on the subject. The motion, however, fell to the ground for want of a seconder.

Dr. Campbell and Dr. Davey made some remarks on the absurdity of Mr. Warwick's motion, the former saying that such a course of procedure as that which Mr. Warwick would wish them to adopt, might do the Association a great deal of injury without any corresponding advantages.

Dr. Robertson said he had received letters from Drs. Manley, Thurnam, Stewart (Secretary for Ireland), and several others, expressing each his regret at being unable to attend the meeting. He had a similar letter from Dr. Flynn, of the Carlow Asylum, in which he also expressed a wish that the Association would mark its sense of the exertions made by Sir Robert Peel, to get the lately promulgated Privy Council Regulations for the management of Irish Asylums passed in the face of most determined opposition.

Dr. Robertson accordingly proposed that a vote of thanks be given to Sir Robert Peel for acting so fully up to what they had pointed out to him as the course which, if adopted, would materially benefit the working of the Irish District Asylums.

Dr. Henry H. Stewart said that, as the hour was so far advanced (it being then five minutes past four p.m.) he would content himself with merely stating, while seconding the motion, that he had learned himself that Sir Robert Peel was obliged to bring into play his most powerful arts of persuasion and determination, as well as perseverance, before he was enabled to induce the other members of the Irish Privy Council to adopt the rules alluded to.

A member then brought forward a case in which he believed the public money had been mal-appropriated by the admission of a so-called *idiot* into a County Asylum.

Some desultory conversation ensued on this statement being concluded, after which

Dr. Bucknill proposed a vote of thanks to the Royal College of Physicians for their kindness in giving to the Association the use of their fine room for the holding of the meeting.

Dr. Munro was requested to convey the said vote of thanks which he promised to do, as also to try and obtain the use of the room for next year's meeting also.

A vote of thanks to the President for his able conduct as Chairman of the meeting was then passed, and the reply of thanks from the President brought the proceedings to a close at twenty minutes past four p.m.

The usual annual dinner of the Association took place the same evening at the Star and Garter, Richmond, when upwards of thirty were present, and a most agreeable evening having been spent, the company separated greatly pleased with the entire day's proceedings, and the high and influential position to which the Association had attained, as a most important section of the Medical Profession.

LAYING OF THE FIRST STONE OF THE NEW COLLEGE OF PHYSICIANS IN DUBLIN.—On Monday, the 7th inst., the first stone of the new Hall about to be erected in Kildare street, Dublin, on the site of the old club-house, by the King and Queen's College of Physicians, was laid by His Excellency the Earl of Carlisle, K.G., Lord-Lieutenant of Ireland. The arrangements made for the performance of the ceremony and for the accommodation of the spectators were perfect. The foundation of the proposed building was boarded over, and in the centre a raised platform was erected, on which chairs were placed for the Viceroy and the principal visitors. This platform was carpeted, and covered with an awning; and at either side of it were ranges of seats rising tier above tier. In addition to the President and Fellows of the College, and a numerous attendance of the Profession generally, a large number of ladies and gentlemen were present. Among the more distinguished visitors were the Earl of Meath; Lord Brabazon; the Lord Justice of Appeal; the President of the Royal Hibernian Academy; Colonel Lake; the ex-Lord Mayor; Sir H. Brownrigg; Sir Bernard Burke, Ulster King at Arms; &c. His Excellency, having taken his seat, was addressed by the President, Dr. Corrigan, who entered into a brief history of the College, from its first incorporation by Charles II., and its re-incorporation by William and Mary, from which latter it derives the title it at present bears. Dr. Corrigan stated that by a recent Act of Parliament the College is authorised to change it designation to that of "The Royal College of Physicians," but that its members are so attached to the name of "Queen," that they have determined to retain their present style. After some further remarks, in the course of which he alluded to the great benefits conferred upon the profession in Ireland by Sir Patrick Dun, who procured the present charter for the College, and bequeathed his fortune to found a School of Medicine under its guardianship, by Dr. Richard Steevens, Dr. Mosse, and the late Richard Carmichael, the learned President concluded in the following words:—"The present year will be remarkable in our annals, not alone as the era of the foundation of our new College, but for an important improvement in legislation affecting our body. For this advantage we are indebted to the Chief Secretary for Ireland, the Right Hon. Sir Robert Peel, whose absence we regret, as we hoped to have the pleasure of thanking him in person on this occasion. The Act introduced and passed by Sir Robert Peel will come into operation on the 1st of September next. Previously to the passing of this Act we could only elect to the Fellowship of our College the graduates of three Universities—practically we were limited to one,—but after the 1st of next September we shall be no longer thus trammelled. We shall then have power to award without distinction to all of those of our Profession whose personal conduct and professional merits deserve it, the fellowship of our College. We shall attain our true position, recognising perfect freedom in education; and our only question henceforth will be, as it ought to be, what a man knows, not where he learned it. It is only just to the memory of Sir Patrick Dun to observe that no such restriction as that I have noticed as hampering the action of our College existed in the charter obtained by him. It was imposed by an Act of Parliament of 1800. Fully impressed with the responsibility entailed upon us of truly carrying out the wise intentions of our founder, relieved from the restrictions that impeded our progress, heartily desirous of promoting the cultivation of our science, and maintaining, as far as falls to our department, the scientific position of our metropolis, we shall endeavour to fulfil to the best of our capability the trust we hold. In conclusion, I have now to thank, most sincerely and gratefully, the Fellows of my College, who have so far overrated my poor abilities as to place me in the proud position of their President, and to deem me deserving of wearing, on this occasion, the robe which has descended through a long line of eminent men from our first President, Sir Patrick Dun. It therefore remains only for me, on the part of myself and the Fellows of my College, to repeat the request, to which we have already received a gracious reply, that your Excellency would confer on us the honour of laying the first stone of our new College Hall." (Loud applause.) At the conclusion of Dr. Corrigan's address, His Excellency proceeded to the place where the stone was suspended, and performed the ceremony of laying it in the usual manner. A glass vessel containing some current coins of the realm, and the following inscription on vellum were deposited in a cavity in the stone:—King and Queen's College of Physicians in Ireland.—The first stone of this building was laid by His Excellency George William Frederick, Earl of Carlisle, K.G., Lord-Lieutenant General and General Governor of Ireland, Monday, July 7, 1862. *President*—Dominic John Corrigan, M.D. *Vice-President*—Aquilla Smith, M.D. *Censors*—Aquilla Smith, M.D., James Foulis Duncan, M.D., John Ringland, M.D., William Moore, M.D. *Registrar*—Lombe Atthill, M.D. *Architect*—William Murray, Esq. *Builder*—William H. Beardwood." In laying the stone His Excellency used a silver trowel, with the handle of Irish bog oak, richly carved with shamrocks, which was manufactured by Mr. John Donegan, of Dame street. On the front of the trowel the arms of the College and the following inscription were tastefully engraved by Mr. Richardson:—"Presented to His Excellency George William Frederick, Earl of Carlisle, K.G., Lord-Lieutenant General and General Governor of Ireland, by the President and Fellows of the King and Queen's College of Physicians, on the occasion of His Excellency laying the first stone of their new College-hall in Kildare street, Dublin, July 7, 1862." Having declared the stone well and duly laid, the Lord-Lieutenant returned to the *dais* and spoke as follows:—"Dr. Corrigan, Ladies and Gentleman,—I consider it both an honour and happiness to perform any part in the good work of laying the foundation of the new Hall of the King and Queen's College of Physicians in Ireland. This City of Dublin is not without its fair allowance of comely architectural buildings, whether for the purposes of business, of pleasure, of learning, or of charity; but surely none can have been raised for a nobler or more benevolent end than that which we have met to inaugurate. The immediate site on which we stand has till very recently been appropriated to uses of social intercourse and good fellowship. We grudge them not the ampler space and proportions which they have now obtained hard by, but certainly if to soothe and to save life is a higher function than merely to enjoy it, this spot will lose nothing of interest or dignity in its new consecration. (Applause). Glad I, therefore, must justly be to find myself in any way united with the objects and members of a Profession who fill so exalted a place in the service of humanity. Among the Medical bodies of Dublin it has been my happy fortune to know many who have coupled their special professional gifts with all the qualities that can exalt, and all the graces that can adorn our life. I think it a happy omen for the work of this day, that the Profession has found a President so entirely worthy to represent it as Dr. Corrigan. (Loud applause.) May the blessing of the Most High rest on his undertaking. May those who fill the high places in the Medical Profession of this country be ever more associated with the high ability and conscientious worth which have hitherto rendered it illustrious, and which have attracted to this city from all shores crowds who deemed it a privilege to sit at their feet and profit by their lessons; and may the building of which we have just laid the first stone ever take within and send without its portals a long succession of pupils and students who shall carry from its honoured walls the learning, the skill, and the devotedness which shall soothe suffering, prolong the lives, and increase the happiness of the coming generations." (Loud applause.) His Excellency then retired, and the proceedings terminated.

THE MEDICAL CIRCULAR.

WEDNESDAY, JULY 16, 1862.

THE ELECTION OF MR. KIERNAN.

After a contest such as has been never known since the College of Surgeons has existed, Mr. Kiernan has been elected a Member of the Board of Examiners. We have now driven home the wedge to the very centre of collegiate exclusiveness. The Board of Examiners is no longer the choice preserve of London Hospital Surgeons,—simply as such. Merit can enforce its claims to a seat in that august conclave. We congratulate the Council upon this election; it is a proof that a more liberal spirit than existed some years ago, when we commenced our assaults upon this body, is infused into its counsels. The MEDICAL CIRCULAR has but one object in view, whether in upholding or assailing the Council, and that object is to do justly both by men and principles.

DR. LANKESTER'S ELECTION.

At the time of the issue of our last number, the result of the poll for Coroner of the Middlesex Central District had not been declared, and some doubt existed whether Dr. Lankester had been elected, and the Profession had, through him, achieved a triumph. That doubt exists no longer. Dr. Lankester, after a stout fight, has won the battle by a majority of forty-seven votes, and he is now Coroner for this populous district of the county. We hope that this contest will settle for ever the pre-eminent claims of the Medical Profession to this important office. The common-sense of the public appears to be unmistakably on our side; but the lawyers have, as they think, a prescriptive right to the office, and will, no doubt, exert all their power and influence to retain it among themselves, whensoever an opportunity occurs. Thanks are due to Dr. Lankester for his manly stand on this occasion, and we congratulate him most cordially on his success.

SELF-SUPPORTING ASYLUMS.

We want a short name for a kind of accommodation for the insane, of which society is greatly in need. At the last meeting of the Social Science Association, it was stated that insanity was increasing at the rate of 1·300 per annum, and a vivid and truthful picture was drawn of the mischief done to poor lunatics, who in the early stage of their disorder, and whilst in a curable state, were sent into workhouses and subjected to the depressing routine of these establishments, instead of being confided to the enlightened care of a man versed in the treatment of the insane, and under whose watchfulness the patient might be restored to health and society. The evil is undoubtedly great, but at the present time, cannot be easily avoided.

Perhaps one of the worst phases of this evil is found in the fact, that all insane patients committed to the care of the Parochial authorities are not, in reality, paupers; they are the wives and daughters and fathers and sons of persons moving in a decent sphere of life, who are, in all other respects, independant of extraneous aid, and who have a becoming pride in their social position and personal self-reliance. Why, then, when any member of the family becomes insane, do they seek the aid of the parish for his support? Alas! these persons do not willingly or hastily seek that succour. For months they will endure the misery of daily association with an irritable, and, perhaps, dangerous lunatic, expend all their hard earnings, and, perhaps, their savings, too, in procuring for him Medical aid or domestic comforts, until, at last, worn down with anxiety, and, perhaps, beggared into submission, they apply to the parish to provide an asylum for the lunatic, now diseased beyond all possibility of cure. No asylum exists with charges within their means. They must either expend half of what they earn to support their relative, or they must be content to throw themselves upon the bounty of the public. But the time passed whilst the pride of the family has been bending, has settled the fate of the lunatic. His case is now hopeless. His darkened mind shall never again be lit up with a ray of intelligence; the shapeless phantoms that terrify his imagination shall never be exorcised; the moanings of his spirit shall never be silenced; his name still remains upon the muster-roll of humanity, but a line has been drawn through it; he is doomed for ever to exile, alienation, and a death-in-life vacuity of spirit.

All this might in many instances be prevented if society would make the effort. It requires only the establishment of asylums, where inmates could be received at a cheap rate, to obviate much of this calamity and ruin.

We believe that there are not at present any asylums where private patients can be received at less than a guinea a week, and there are not many even of those which receive patients at so low a charge. Now, if asylums were founded where the patients could be kept for the minimum cost of the board, facilities would be offered for the accommodation of lunatics in the humbler classes of life which would be greedily seized, and would be conducive of great social advantage.

We press this subject especially upon the notice of County Magistrates, within whose power it is, by a mere vote, to provide this invaluable accommodation. Let them allot a portion of their buildings for this class of patients, charging only sufficient to defray the expense of maintenance, and they would confer a blessing upon their poorer neighbours.

When the City of London was considering a plan for an Asylum this purpose was seriously discussed as a part of the scheme; whether it will be finally adopted or not, we cannot foretell. We hope it will; and that the City, so renowned for its noble charities and the munificence of its merchant princes, will set an example to the rest of the country which will find many imitators.

Our Union Boards should encourage projects of this kind, if only from the economical view of saving their own funds. It has often been considered feasible for them to issue loan-tickets to persons not actually paupers, to enable them to get medical aid with a promise of payment to the Guardians when the patient's health was restored. What class of persons could require their irregular assistance so much as the helpless lunatic? Suppose they were to consent to the poor's rate being applied by the magistrates in the erection of wards for humble, middle-class lunatics, it would be only a wise and humane extension of help, attended with the advantage of an ultimate relief of their own resources.

However this work may be done, whether with public funds or by private munificence, it is a work that is imperatively required to be performed. Humanity pleads for it at the hands of an exacting civilisation. It often happens that a free-handed charity is the wisest statesmanship; and we believe that in this case a liberal use of national funds in behalf of the middle-class lunatic would be a blessing highly valued and approved by the country.

THE Viceroy of Egypt has proposed to the Emperor of Austria to let the Empress Elizabeth pass the next winter at Cairo. Her Majesty, who is now at Kissengen, is somewhat better, but still extremely weak and suffering.

SUMMARY OF THE WEEK.

GRATITUDE.

In consequence of the influx to this country of a large number of continental *savans* to visit the exhibition who were strange to our manners, and without English connections, it was thought that we should be only performing a becoming act of courtesy in throwing open the halls of our societies to give them a welcome. The Royal Society, and the College of Physicians, as well as other bodies, have acted in this spirit. But whilst we have been flattering ourselves that we have done an act of kindness and afforded a few evenings of social gratification to our foreign confrères, we have, it seems, on the contrary, excited emotions of a very different kind. A writer in 'L'Union Médicale' says that some of these meetings were organised by subscription, and he charges us with exercising our usual skill in making money by organising "soirées after soirées during the Exhibition year, to attract foreigners." After this we advise that a subscription should be raised to refund these unfortunate foreigners the expenses of their visit. We will take care, however, that this hospitality "to attract foreigners" shall not be repeated, as it has been obviously very distasteful. The taste and truth, too, of such a communication as this in 'L'Union Médicale' may be questioned.

SENTENCE ON MRS. VYSE.

This lady has undergone her trial at the Central Criminal Court, and has been acquitted of the charge of murder on the ground of insanity. She will, therefore, be retained in an Asylum during her Majesty's pleasure. The verdict was that which was generally expected, as it was difficult to believe that any woman of sound mind could have murdered her offspring under the circumstances described. It appeared in evidence that several members of her family had been insane—her paternal grandfather and maternal grandfather, her uncle, her cousin, and various other relations. There was, consequently, every presumption of an hereditary taint.

MURDER OF MR. PUCKETT.

The newspapers have contained an account of a most shocking murder committed at Sutton near Weymouth, by a lunatic named John Cox. The victim of this man's fury was Mr. Puckett, the Union Surgeon, who having had Cox under his care for some time, declared his determination, in the man's presence that he should send him to a lunatic asylum. On the appointed day, Mr. Puckett went with a man named White to Cox's house, but having heard that he was very violent, and had threatened to murder him, he sent White for a cart whilst he himself went into the house for the purpose of quieting the lunatic. On his entrance the lunatic darted at him and said he would kill him, Mr. Puckett escaped outside the door, which he held closed by the handle; but, unfortunately, relaxing his hold, Cox rushed out and stunned him with a blow over the eye. Cox afterwards dragged him into the room, and sawed off his head and right hand and foot; the enraged lunatic dragged the mangled body about the room, and eventually threw the severed head and members into the road. Having satiated his frenzied wrath, he made his escape, but was subsequently captured at the Plough Inn, near Osmington. The father and mother were outside the house, but were so terrified that they were unable to interfere. Mr. Puckett was over sixty years of age, and was highly respected in his neighbourhood. We have seldom had to record a more horrible event. We would merely observe upon this recital, that Union Surgeons are not compellable to superintend or effect the seizure of a lunatic for conveyance to an asylum. Their duty is fulfilled with the writing of the certificate. We know that in the country, surgeons are apt to undertake the dangerous duty; but we advise them to leave it to the proper officers.

RETIREMENT OF DR. MUSHET.

It is much to be regretted either that Dr. Mushet continued in the field so long, or that continuing the contest he did not go to the Poll. After so many flourishes of determination, and boasts of his promises of support, we did not expect to find him backing out when the crisis was at hand. The result is that there is now no Medical candidate for the Western District. Dr. Mushet promises to come forward again on the next opportunity; perhaps he may, and retire again, for we doubt if he will receive much help. He has been faithless to the confidence of the profession, and has kept better men out of the field. We supported him warmly; and helped to clear the ground for him to win, but he has disappointed us,—a circumstance that is not likely to happen a second time.

MR. LAWRENCE IN HIS ORIGINAL CHARACTER.

At the late Fellows' Dinner, Mr. Lawrence, amid repeated plaudits, reappeared in his original character of Reformer. We must confess that he played the part remarkably well, and exhibited a large portion of his early vigour. The 'Lancet' has given a brief report of his speech; and in order that our readers may judge of its worth, we transcribe it:—

"Mr. Lawrence, who was cheered on rising, proceeded to contrast the present system of "over lecturing" with the more efficient education afforded principally by clinical instruction. Long-winded courses of lectures on Materia Medica, Botany, Chemistry, and so forth, utterly failed to accomplish the great end of all medical education—that of making practical physicians and surgeons. The great men of the past—not surpassed, if equalled, by any of our own day—such men as Heberden, Mead, the Hunters, Astley Cooper, and Abernethy, were not brought out by a round of tedious routine lectures, but were taught to observe for themselves, and to reflect. However much, therefore, those collections of lectures denominated "schools" might suit the purposes of the lecturers, they served no useful end compared with the invaluable experience gained by pathological combined with clinical observation and instruction. What essentially constituted a medical school? Was it not the hospital itself, wherein was gathered the principal object of medical and surgical study, and of future practice? He therefore strongly supported the principle—at variance with the "recommendation" of the General Medical Council—that students would most advantageously commence their medical education in hospitals, not necessarily having schools connected with them. By this regulation, very many most excellent hospitals could be brought into use, and made subservient to medical education. He contended that, keeping steadily in view the eminently practical character of surgery, it would be far more appropriate to use the old and expressive term 'apprentice,' in preference to the newfangled designation 'articled student.' The *practical* knowledge of medicine and surgery was to be learned only by practice; and all other branches of medical knowledge were subordinate, and important merely in proportion to their subserviency thereto. How 'articled students' contrived to undergo the present severe ordeal of their successive examinations, and come out decent practitioners, was a puzzle to him. They must have broader backs to bear their burden than he could well imagine. In his opinion, it would be far better to revert to the more practical character of medical education in the time of Abernethy, than continue the 'over-lecturing' system of the present day."

What say you to this, gentle reader? Down with those long-winded lectures! Down with the Schools! Down with the Medical Council! Down with articled students! Down with—no—up with Mr. Lawrence!

HUMAN REMAINS OF REMOTE ANTIQUITY.—At the meeting of the Ethnological Society, held on the 1st inst. Mr. Mackie described the human remains found at Markham, in the Valley of the Trent. The skull possesses very peculiar characteristics, and belongs to an extinct and pre-historic race of men. Its most remarkable feature is the unusual direction of the foramen magnum. The direction of this plane, indicating an approach, though in a very moderate degree, to the head of the gorilla and the chimpanzee, leads to the inference that the individual to whom it belonged was possibly not completely erect in his carriage. The other human bones discovered, including those found at the Heathery Burn Cave, belonging to the same pre-historic race of men.

REVIEW OF THE PERIODICALS.

The 'British Medical Journal' (June 28th). Dr. LATHAM'S articles are continued. He expatiates this week on *Pain*. What are we to understand by such rhapsody as this:

"Playing upon the nerves as upon an instrument, the force which Pain can exercise over the movements of disease is very various. It can raise, and it can depress them. It can quicken them into twofold activity and liveliness, and it can subdue and bring them down as low as death. Moreover, still playing upon the nerves, it can so jar and spoil the concord of symptoms as to falsify the disease, and make it appear other than it really is."

Dr. Latham gives a few cases from the author to show that mere Pain can cause death. The following is curious and instructive:

"In Dr. Merriman's 'Synopsis of the Various Kinds of Difficult Parturition' in a case, furnished by Dr. Gooch, of a woman in whom the severest pain and the most violent expulsive efforts still continued after the child was born, until she became cold and delirious, and her pulse gradually went out, and she died. After death, the pain and the expulsive efforts were found to be owing to a polypus, which had its attachment to the mouth and some way up within the neck of the uterus. Dr. Gooch remarks upon the case 'as a striking proof that mere pain can destroy life.'"

Dr. LATHAM remarks that the capital punishment by *crucifixion* caused death by severe and protracted pain. The writer then discusses the influence of pain in disorders of the stomach, "sick headache," in rheumatism, gout, &c., and adds that oftentimes the successful treatment of these cases has turned upon the administration of an opiate. Dr. GRAILY HEWETT continues in the same journal his lectures on the *Diseases of Women*. On the treatment of *Dysmenorrhœa*, he says:

"Whatever be the cause of the painful sensation experienced during menstruation, certain general rules are applicable as regards the treatment.

"The first element in the treatment is *rest* during, and for a short time previous to, the period of the flow. The patient must be directed to remain more or less constantly in the horizontal posture during the period in question. Means are to be taken to ensure the regular and proper action of the digestive organs. The food should be plain and simple; and aperients are to be administered, if necessary, to produce regular action of the bowels, and prevent congestion and fulness of the pelvic organs.

"We are often called upon to prescribe remedies calculated to relieve the pain actually present. When the pain is very severe, opiates may be necessary; and these are most efficacious in the form of enemata. We are generally able, however, to do without opium; ether, of which the best and most efficacious preparation is unquestionably the compound spirit of sulphuric ether of the *Pharmacopœia*, combined or not with camphor, henbane, or sal volatile, one or more of these are medicines very satisfactory in their effects, when given for the purpose of alleviating temporarily the pain present in menstrual retention, or for more simple cases. Cannabis Indica is a valuable medicine in certain cases An objection to it, stated by Dr. West, is the varying and uncertain strength of the preparations obtainable. Chloroform inhaled, or given internally in the form of chloric ether, is often employed with advantage. Opium, in doses of half to one or two grains, may be necessary in extreme cases. Opium and camphor combined I have frequently found very serviceable. When we have reason to believe that the sufferings of the patient are connected with the presence of a tendency to gout or rheumatism, it will be proper to give colchicum internally, which may be advantageously combined with a little blue pill, every night or every other night; and saline laxatives twice or thrice a day.

"The warm hip-bath, in which the patient is to remain for half an hour or so, is perhaps the most effectual of all remedies in affording relief from the extreme pain sometimes present, while it is occasionally not less effectual in directly causing the discharge to appear. It is, in fact, both palliative and remedial in its effects.

"Although I have been all along advocating a mechanical theory of dysmenorrhœa, it does not follow from this that I am an advocate for an universal mechanical treatment.

"The urgency of the symptoms and other circumstances must determine whether, in a given case, it is necessary or advisable to adopt other than the general treatment now described. The presence of sterility, associated with dysmenorrhœa, may be mentioned as a circumstance which would show the necessity for having recourse to other measures directed specifically to the removal of the cause; and, if the canal of the cervix were found too small, it would be desirable to enlarge it. A careful examination of the cervical canal, the manner of effecting which will be explained in its proper place, will generally give the observer a knowledge of the cause of the disorder, and what is the proper remedial treatment will in most cases forthwith suggest itself. In many cases, even where there is evident narrowing of the cervical canal, it is not judicious to attempt and at once to dilate the same by cutting or otherwise, as more good may result from the treatment of the condition leading to the narrowing in question.

"*Means of Procuring Enlargement of the Canal of the Cervix Uteri.*—There are two methods by which the calibre of the cervical canal of the uterus may be increased—incision and dilatation.

"*Incision.*—The hysterotome of Dr. Simpson is an instrument by which the cervix may be incised from within longitudinally, and the canal thus enlarged. In using the instrument in question it must be recollected that the part of the canal which it is desirable to affect by the operation is situated high up; and under ordinary circumstances, therefore, the instrument must be introduced more than an inch before the blade is projected and the cutting effected. Moreover, it is desirable to make two slight incisions, one opposite the other, rather than one deep one. In cases where the instrument of Dr. Simpson cannot be introduced, the internal os uteri being too narrow to admit it, Coghlan's probe-pointed metrotome will be found applicable. (See 'Med. Times and Gaz.', June 1st, 1861, p. 573.) After performing the operation, it is advisable to introduce one of Dr. Simpson's solid round metallic bougies, of which graduated series are sold by the instrument makers, in order to maintain the patency of the canal; otherwise the effect of the operation is lost by the healing of the cut surfaces. The metallic bougies are less objectionable than sponge-tents. Little tubes of rolled lead have been recommended for the same purpose (Coghlan).

"*Dilatation.*—The dilatation method consists in the gradual enlargement of the cervical canal by means of bougies or other instruments gradually increased in size, one instrument being worn for a certain number of days, and then replaced by another a little larger; or a speedier method, but one not quite so easily carried out in the particular kind of cases now under consideration, is to dilate the canal by means of sponge-tents; and, having obtained the necessary enlargement, to leave an instrument in to maintain the patency of the canal.

"Incision and dilatation are not equally applicable in all cases, and incision is open to certain objections which do not apply to dilatation. The danger of purulent absorption and pyæmia is greater when incision is performed; and, although the operation is more speedy, it is, unless conjoined with careful subsequent treatment, less certain than the more tardy dilatation process. Care should always be exercised in dilating the cervix uteri; for, although, as a rule, the organ is capable of bearing a tolerable amount of rough treatment with impunity, it is not by any means always so; fatal peritonitis has followed want of attention to this rule. If sponge-tents be employed very great attention to cleanliness is essential. It is proper always to allow a day or two to intervene between each insertion of the tent, and it is better not to leave the tent in the cervical cavity more than four or six hours. After removal of the tent, tepid water should be very gently thrown up the vagina."

The 'American Medical Times' (June 21). Dr. ISAAC TAYLOR contributes a paper headed *On the Non-Shortening of the Supra and Infra-Vaginal Portion of the Cervix Uteri up to the end of Pregnancy.* The author does not agree with the generally-received opinion that the cervix shortens during pregnancy. One would think that this question was one of very easy determination. Dr. Taylor fairly cites all the eminent opinions on this subject which are against him. He then goes on to say:

"During a service of four consecutive months, in the Bellevue Hospital, as well as in the Island Hospital, in the spring and summer of 1861, and also during a short service in the fall and winter, in the presence of the house staff, and several medical gentlemen and students, not less than upwards of one hundred and fifty patients have been examined by the touch and speculum, at various periods of gestation, from seven months to the full time, and during the first stage of labour in some of the patients. Nearly all, however, were the completion of pregnancy. I am not aware that the investigations relating to this subject at full term, and during the first stage of labour, have been conducted in the like manner, but the touch has been solely relied upon. Dr. Duncan, who has written an excellent article, and published in the March number for 1859, p. 776, says, after recommending the investigator to measure the length of the cavity by introducing his finger through the external os uteri:—'I would especially insist on the value of examinations made immediately before labour, when the cervix is extremely softened and largely dilated.' And at page 774, 'In discussing this subject, I intentionally omit the latter days of the ninth month of pregnancy, and diagrams of the cervix are made from the third to the eighth month.' While a pupil of Cazeaux, in 1841, I became acquainted with the views of Stoltz, modified in some measure by Cazeaux; and after my return home, edited the work of Dr. Evory Kennedy on obstetric auscultation, where

diagrams were introduced, showing how these changes of the cervix took place. Shortly after my service commenced, in 1851, in the Bellevue Hospital, my attention was especially called afresh to the subject, in a female dying in the first stage of labour from apoplexy, who was brought into the hospital from the street; and a second case in 1853, and another in 1854, at the same period. On post-mortem examination, no change was manifest of the supra or infra-vaginal portions, except in being softer and broader than natural. Just previous to presenting the subject before the Academy of Medicine in this city, in March, 1862, Professor C. R. Gilman gave me a specimen taken from a female, who died in the first stage of labour from placental apoplexy a few days before, where there was no change in the whole cervix, supra or infra-vaginal portion. Another specimen of my own was also presented to the Academy, showing how soon the neck returns to its natural size when there is no laceration of the os, taken from a patient who died in the Bellevue Hospital very soon after the child was born, where the whole neck was as perfect as though no labour had occurred.

"Dr. Dalton (J. C.), in the March No., 1860, of the 'New York Medical Journal,' said at the Pathological Society:—'He could say very positively, from his own observations, that neither the os internum nor the os externum disappears at all, even up to the end of the ninth month; and that he is very sure that he has seen both the os internum and the os externum clearly marked in a case that died during delivery.'

"The examinations of the patients were made by the touch, horizontal and dorsal position, and by various kinds of specula—the glass black-coated speculum preferred—and the records taken by the house staff, and several of the cases were delivered the same day, or one or two or three days after; and in many instances the infra-vaginal portion of the cervix was longer instead of being shorter.

"To more fully comprehend and appreciate these investigations, it would be well to enter somewhat into the details respecting the appearance of the cervix and os uteri in multiparæ and primiparæ. The appearance of the cervix uteri, in both the multipara and primpara, was broader, softer, and in several instances longer than shorter, in comparison with the non-pregnant uterus, examined at the same time. The measurements of Farre, Duge, and Velpeau differ only one-sixth of an inch in the whole cervix; and the infra-vaginal portion is stated at one-third to one-half an inch in the non-pregnant. Yet, in several cases, the measurement gave in these examinations one inch, usually three-quarter inch. The colour, in the general run of cases, was of a light blueish red; in some, quite dark blue, in others very little change had occurred, but sufficiently so as to differ from a simple congested cervix uteri by disease. In several, the physiological changes of colour were so great, and the veins enlarged to such an extent as to become hæmorrhoidal; and in three or four instances, at the commencement of labour during the expansion of the cervix uteri, they were lacerated, and quite a hæmorrhage ensued; so much so, as to be mistaken for a case of partial attachment of the placenta. As a general rule, the vagina did not present that blueness spoken of by Kluge, Jacquimier, and Kilian, but the contrast of the cervix uteri was distinctly marked in colour, as well as the entrance of the vulva, whilst the vagina was but slightly tinged. The blueness of the cervix uteri and the entrance to the vagina was generally in the same ratio as the colour of the areola. The ramollisement was the characteristic feature in nearly all of the cases examined by the touch, and in nearly all it was full, soft, and compressible, like wet chamois leather: this, however, was not always the case, as some did not present, even at the full term, this softness, though the blueish colour existed. In multiparæ, if the os uteri had been lacerated by previous delivery, the os was pætulous and the cervical lips everted, showing the glandulæ nabothi; and the same would exist in some of the cases in primiparæ, where the cervix had been divided for dismenorrhœa, or disease. The finger in these cases could be introduced to the full extent of the cervix, and the fœtus felt. But this was not attainable if the os uteri had not been lacerated or divided; and this will explain why, according to Cazeaux, the neck is funnel-shaped in multiparæ. In the primapara, it was seldom the finger could be introduced beyond a quarter of an inch, generally only a mere dimple or depression was realised by the touch, and the cervix presented a conical form up to the time of labour; but, being broader, longer, and softer than in the non-pregnant, the os was generally round, though sometimes it was a tranverse slit.

"In some of the cases of multiparæ at the seventh month, the finger could be introduced to feel the child, through the membranes; the os seemed to be capable of being dilated a quarter to a half inch in diameter, though the neck was not shortened. In the case of the first stage of labour, the cervix, during an examination, would seem to be dilated to the size of a quarter dollar during contraction; but after the pain had ceased, the neck would appear fully three-quarters of an inch in length, and nearly closed, as though no labour existed. In many of the cases a cervical leucorrhœa existed, and in some of the multiparæ examined, after the finger had passed through the cervix, no discharge was perceptible, and, therefore, the cervical plug did not exist, as many suppose, up to the full term of gestation. When the position of the patient was changed from the dorsal to the lateral, the neck was, to the touch, longer, and more fully developed through the speculum, thus verifying on this point the result of such a change, as is shown in one of the plates of W. Hunter."

His propositions finally are thus stated:

"*Proposition* 1.—That the cervix uteri, supra and infravaginal portion, does not unfold or lose itself during gestation in the body of the uterus, and the cervix uteri become obliterated at the full term of pregnancy, as Baudelocque, Gooch, Dewees, Meigs, Montgomery, Bedford, and others, believe.

"2.—That the cervix uteri is not lost or merged into the vagina, by dilating from below upwards, and becomes obliterated at eight to eight and a half months, as Stoltz, Chailly, and others believe, but remains of its natural length and is sometimes longer.

"3.—That the whole cervix uteri, supra and vaginal portion, remains intact up to the full term of pregnancy, and sometimes during the first stage of labour.

"4.—That the shortening, as it is termed, is only apparent to the touch, consequent upon the ramollissement and physiological hypertrophy that take place during gestation, the cellular tissue becoming infiltrated by the changes incident to pregnancy, and hence its breadth is greater than natural and softer.

"In multiparæ, where laceration of the os uteri has taken place, on one or both sides, and the glands were also diseased, and labia are everted and the os patulous, the same as is noticed in many cases of cervical leucorrhœa, and hence, the finger can be introduced at the seventh, eighth, or ninth month, to the internal os, and touch the membranes of the child, and should the cervix have undergone a more perfect softening, the os and cervix may be dilated a half to three-fourths of an inch in diameter, though the whole cervix remains, supra and infra-vaginal portion.

"5.—That in primiparæ, the finger cannot be introduced into the external os uteri; but in very exceptional cases, it may reach half way through the cervix.

"6.—That the external os is always felt first, and not as some have supposed, the internal os.

"7.—That the secretion of the cervix uteri, which forms the so-called plug, does not remain to the full term, but is changeable from time to time.

"8.—That the more perfect the softening the shorter the labour.

"9.—That when labour sets in, especially in a primipara, the cervix (even if obliterated, and the os the size of a five-cent piece) can be clearly defined from the body, by the difference it presents to the touch of the thick, round, and soft portion of the body, and the tense thin membranous neck, and os.

"10.—That after labour in primiparæ, if the neck has not been lacerated, the cervix uteri will return, supra and infra-vaginal portion, to its natural length very soon, though it is patulous and soft.

"11.—That these propositions are also corroborated by cases where the complete separation of the vaginal portion of the cervix has occurred, and which could not have taken place if the neck was fully obliterated at term (case in Bellevue Hospital), also in cases of excessive œdema of the cervix, where the neck is one and a half to two inches in length.

"12.—That from the investigations made during life, at various periods of pregnancy, at full term, and during the first stage of labour, and on post-mortem examinations, the cervix uteri does not undergo any shortening or expansion of the supra or infra-vaginal portion, but retains its whole length, and only becomes expanded or dilated at the commencement of labour, the cervix serving as an intermediate channel, or canal, between the body of the uterus and the vagina; this dilatation is effected through the combined operation of the softened condition of the neck, and by the pressure of the liquor amnii and the descent of the child's head or body, the internal os being the first to yield. The expansion thus beginning slowly, tends downwards towards the external os, and then the walls of the cervix are gradually expanded and unfolded for the passage or exit of the child; no better or more perfect illustration can be adduced, than the gradual expansion of the horse's anus during an evacuation, and its contraction after an evacuation occurs. Some of the cases of labour in the hospital have illustrated the same facts; during the first stage of confinement, while the membranes have been protruded through the os tincæ, only a half inch in diameter, the child has been delivered soon after."

The 'Lancet' opens with Mr. HILTON'S Lectures on *Pain*. He treats this week of the important subject of opening diseased joints. He says:—

"Some surgeons would say, 'I see no harm at all in opening the abscess as soon as it shows itself;' and they advise the treatment accordingly. For my part, I believe such a recommendation is fraught with extreme danger to the patient, and marks the indiscretion of the surgeon."

The healing process, Mr. Hilton says, goes on better when the

atmospheric air is excluded; consequently opening a joint by giving admission to oxygen must be prejudicial. He observes:—

"Experience teaches us that so long as an abscess remains unopened, and its walls are kept free from local disturbance by the muscles or other causes, usually no inflammatory condition is manifested upon the walls of the abscess. Then one might fairly say to oneself, 'Why open it?—why not leave it alone? It is not doing harm in any way, either as regards the original local disease or the general health; why meddle with it?' On the other hand, all surgeons know that when such an abscess is opened, it becomes, or it may become, inflamed, and great local and constitutional disturbance may supervene; the effects of that inflammation will be that the originally diseased parts, as well as the new repairing structures within and without the joint, will participate in both the local and constitutional disturbance, which lowers their vitality; and they soften down or ulcerate, and become subservient to the law, *that inflamed or newly-formed or renewed structures suffer rapid deterioration from constitutional or local disturbance.* This is no exaggerated statement; I have seen many illustrations of it. Thus, we know that if a person has had an ulcer recently healed up healthily, or a cicatrix which has well closed after a burn or scald, if he contracts erysipelas (a blood-poison), not at the seat of injury, but elsewhere, or is attacked by small-pox, scarlet fever, or measles (blood-poisons), the cicatrix, which was perfectly healed, will quickly ulcerate, break down, disintegrate, or entirely melt away. If this be true with regard to external parts, may we not argue that it is equally true with regard to internal parts? If we can see the fact manifested on the surface of the body, that scarlet fever, erysipelas, &c., or local inflammation, can so damage new tissues as to lead to their destruction, whilst those which have not been previously diseased or structurally deteriorated will pass unscathed through that ordeal, surely that is a potent argument against the propriety of opening these abscesses early. These facts form the basis of one of our arguments against the propriety of opening an abscess connected with a diseased joint before it is absolutely necessary, or before the medium of reparation deposited within or about the joint, or interposed between the bones, is so completely consolidated, and so efficiently organised, that it is structurally competent to resist the twofold deteriorating influences of local and constitutional disturbance, or of either of them."

His advice is thus ultimately given:

"Instead of hesitating as to what we should do in the case of an abscess communicating with a diseased hip joint, I would advise that the opening be deferred as long as possible, until we can be pretty well satisfied that anchylosis or bony consolidation has actually taken place at the joint. If the bony union be perfect, then we may open the abscess without involving the patient in undue risk, as regards the repair of the joint, or as regards the general health."

He narrates a case of hip-joint disease in which the opening of a large abscess was deferred for eight months. It is eminently a crucial case, and we give an extract from the report:

"A large abscess presented itself at the anterior part of the hip-joint, and slowly descended the thigh. Cod-liver oil, steel wine, and quinine were administered as medicines; the recumbent and a fixed position of the diseased joint were strictly and uninterruptedly maintained. These were all the means employed. No counter-irritation, none of the old horse-doctoring style of treatment—no setons, issues, nor painful applications of any kind. In March, ten weeks from my previous visit, I saw the patient again, and found that her health had steadily improved. The abscess subsequently diminished in size, and descended lower down the thigh, and appeared perfectly unconnected with the joint. After eight months of rest, the femur and acetabulum being firmly united, there being no pain in the joint, and no constitutional disturbance, the abscess was opened at its most depending part; it discharged a strumous, purulent serum, containing cheesy flakes and masses, the thigh was afterwards carefully strapped and bandaged, so as to coapt the walls of the abscess, the pressure being made upon the cyst from above downwards. The abscess closed somewhat rapidly. The recumbent position, with the splint upon the limb, was maintained a few months longer, and she regained perfect health, with a firmly anchylosed hip-joint.

"The conclusion of this case is this:—She is now in her twenty-first year, in good health, and well grown. The right leg is only half an inch shorter than the left, and she cannot be said to walk with a limp even. She is an excellent dancer, frequently dances for a whole evening, and but few persons know, when she sits down, that the right knee-joint is bent at right angles with the thigh and body, and tucked under the chair to meet the inconvenience of her fixed hip-joint.

"This case shows that, notwithstanding the continuance, more or less for several years, of symptoms of diseased hip-joint, with every indication of most serious ulterior consequences, yet by 'rest during many months, and with an appropriate, but simple splint, the patient may get well. It also exemplifies in a most emphatic manner the advantage of deferring the opening of the abscess till the medium of union is consolidated between the two bones, so producing perfect anchylosis of the joint."

Dr. Robert Barnes contributes an article intituled the *Obstetric Bag*, being a description of the instruments used in operative midwifery, and Mr. Radcliffe a paper on the *Recent Epidemic of Diphtheria*. Dr. Leith Adams reports a case of *Encysted Abscess in both Hemispheres of the Brain*. There was neither convulsions nor paralysis in this case; there was, however, sickness of the stomach. Coma came on only three days before death.

Dr. Cartwright Reed reports a case of *Resuscitation in a Fœtus after Long-suspended Animation*. Dr. Reed arrived twenty minutes after the birth, the child having been supposed to be still-born; he detected, however, a fluttering over the region of the heart, and commenced breathing into the child's mouth, and making compression of the ribs. After forty minutes the child sighed, and by perseverance in these measures it was finally resuscitated.

The 'Medical Times and Gazette' contains *Clinical Remarks on Seven Cases of Ovariotomy*, by Mr. Spencer Wells, which are interesting. Dr. Arthur Mitchell writes on *Difficult or Anomalous Parturition in Connection with Idiocy*. This article contains some suggestive statements: we will quote a few. The cases of idiocy under analysis were 494, and Dr. Mitchell remarks:

"For instance, when it is said that 22, and probably more, of the 494 idiots were delivered by forceps, the fact will have a very different signification to a Siebold or a Busch, who deliver respectively every 7th and 12th woman under their care by forceps, from that which it may be expected to have to a Collins or a Simpson, who only deliver in that manner respectively every 617th and every 472nd mother. The proportion of cases supposed to require instrumental delivery differs very widely in the practice of different Schools and Institutions. It is difficult, therefore, if not impossible, to say definitely, regarding the fact in question, that it is in rule or out of rule. And the same difficulty extends itself to the other results of this investigation. . . . . .

"The act of birth is, beyond doubt, fatal to a large number of children, and this result is most likely to occur when the case is complicated, tedious, or instrumental. The measure of the calamity, in fact, is in direct proportion to the seriousness of the difficulty or anomaly. And it is a reasonable inference, that that which is fatal to so many, will inflict grave and permanent injury on many others where *life* may be spared. And further, since it is the head which is chiefly exposed to such injury, it may fairly be expected that disease and defective development of the brain should follow.

"The head, indeed, in all cases is subjected to such compression as to make one rather wonder that it ever escapes than that it often receives injury. According to the extent of this compression, so we know is the frequency of *fatal* results, and so also will the frequency of those injuries be which are *short of death*. Increase the size of the head only by the difference which exists between the heads of male and female children, and an examination of the results will prove what has been stated. Many more boys than girls always die from the act of birth, and it is the act of birth which makes the difference; for of the still-born, who perish before parturition begins, or who are putrid when delivered, there are as many girls as boys, if not more. But not only does the act of birth kill more boys than girls; among those whom it merely injures there are also more males than females. As one proof of this, I think I am justified in using the greater mortality of male children during the first year of life. There is a further proof in the fact, that while of those who become insane in adult life there are constantly more females than males, the reverse is true of those whose insanity dates from infancy, among whom there are constantly more males than females.

"Another fact which supports these views is derived from the very large proportion of idiots who are first-born children, in whose cases the difficulty of parturition depends on the state of the passages and not on the size of the head, as when it was the question of sex."

The following is a condensed statement of the results of my inquiry:

"I. *Labour Tedious or Protracted.*—Of cases in which the labour was long, 57 are noted, or one in 8·7 of the whole. . . . .

"II. *Labour unnaturally Rapid.*—Four cases are noted in which this occurred. In all of these, labour was said to have lasted less

than one honr. In one, the placenta was delivered along with the child, and in another, the child was delivered into the night-stool.

"III. *Delivery by Forceps*—Of such cases, 22 occurred, or 1 in 22·5. The Edinburgh Maternity shows 1 in 472. We have here, therefore, a very wide contrast. One of the 22 was paralysed at birth. Several had fits after birth. In others, animation was suspended. One was born with double rupture. In 9 cases, bald patches or cicatrices about the head attested the use of 'the instruments.' I mention this last, though I am aware that even great permanent depressions have been said to follow forceps deliveries, without any such accompanying defect of intelligence as to be acknowledged. . . . .

"IV. *Version.*—Four cases of this occurred, or 1 in 123. The Edinburgh Maternity shows 1 in 236. By correspondence and otherwise, every effort was made to determine that turning had really been performed in these four cases. Here again, of course, we are only dealing with survivors.

"V. *Preternatural Presentations.*—On this point I obtained very scanty information. Only 6 cases are recorded, the breach presenting five times and the feet once.

"VI. *Plural Births.*—Twins occurred 11 times, or *quam proxime*, every fortieth idiot was found to be one of twins. In a separate paper I shall discuss the connection between plural births and idiocy.

"VII. *Premature Births.*—I thought that I should easily obtain trustworthy information on this point, but I found it otherwise, and was often left in doubt as to whether the idiot under examination had or had not been born before the full time. This occurred especially in alleged eight-month cases. . . .

"VIII. *Animation of Child Suspended at Birth.*—In 29 instances (or 1 in 17) this is noted. In most of these cases it was stated that the child had been dipped first in hot and then in cold water, or that it had been rubbed with whiskey, or that its throat had been tickled with a feather, or that the Doctor had 'worked its chest.'

"IX. *Condition of Idiot at Birth* (c).—(*a*) In 33 instances, or 1 in 9·3, the idiot was described as having been weak at birth. (*b.*) In 11 instances, or 1 in 28, the idiot was described as having been notably small and puny at birth. (*c*). In 23 instances, or one in 13·4, the idiot was described as having been unable to suck for several days after birth, and in some of these the child did not attempt to suck for thirty days. (*d.*) In 17 instances, or one in 18·1, there were such peculiarities about the child at birth as to lead at once to the suspicion of idiocy.

"All these conditions are more or less directly connected with difficult or anomalous parturition, and for that reason they and others of a similar character are here stated.

"X. *Number of Idiots who are First-Born and Last-Born Children* (d).—443 idiots and imbeciles gave 138 first-born children, or 1 in 3·2. The increased danger to which first-born children are exposed in parturition must in part explain this, though I do not think that it accounts for all.

"Of the same number of idiots and imbeciles (443) 89 were last-born, or *quam proxime* 1 in 5. Of these my notes show that 1 was the youngest of 17, 1 of 15, 1 of 14, 1 of 13, 4 of 12, 6 of 10, etc.

"XI. *Other facts not embraced under the Foregoing Headings.*—(*a*). In one case the mother of the idiot insisted that her child's condition was attributable to her having gone 'greatly beyond her time.' (*b.*) In one case great flooding preceded labour. (*c.*) In one case there was adhesion of the placenta, requiring forcible removal."

Mr. Horsley contributes a paper on the *Nitro-Prussiate of Sodium as a test for certain Alkaloids.* It is said to be a very delicate test for strychnia, morphia, &c. Dr. Ceccarelli communicates some *Notes on Cholera at Rome in* 1854.

MEDICAL SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

Tuesday, June 24th.

Dr. Babington, President, in the Chair.

Mr. Salter read a paper entitled

AMAUROSIS CONSEQUENT ON ACUTE "ABSCESS" OF THE ANTRUM, PRODUCED BY A CARIOUS TOOTH.

The case upon which this paper was based was one of unusual severity, and of exceptional complications.

The patient, a young woman, twenty-four years of age, was attacked with violent toothache in the right upper first molar, which was followed by enormous swelling of the side of the face, and intense pain. The eyeball then became protruded, and she soon after perceived that the eye was blind. Shortly after the establishment of these symptoms, "abscess" of the antrum pointed at the inner and then at the outer canthus, and a large discharge of pus at both orifices followed; these orifices soon closed, and the general symptoms of the part continued unchanged—the swelling of the face, protrusion of the globe, and blindness. This state of things lasted for about three weeks, when the patient was sent to Guy's Hospital, and admitted.

At this time the patient exhibited hideous disfigurement from swelling of the face, œdema of the lids, and lividity of the surrounding integument. Upon examining the mouth, it was found that the carious remains of the first upper right molar appeared to be associated with and to have caused the disease. Together with the other contiguous carious teeth this was removed, and led, by an absorbed opening, into the floor of the antrum. The hæmorrhage which followed the operation was discharged partly through the nose and partly through the orifices in the cheek, as well as from the tooth-socket, showing a common association of these openings with the antrum. The condition of the eye constituted the most important symptom, and the most distressing. The sight was utterly gone; the globe prominent and everted. There was general deep-seated inflammation of the fibrous textures of the eye. The pupil was large and rigidly fixed; it did not move co-ordinately with the other under any circumstances. Some abatement of the symptoms followed the extraction of the tooth; but it was soon found that there was a considerable sequestrum of dead bone, which was removed. The necrosis involved the front part of the floor of the orbit, the upper cheek portion of the superior maxilla, with the infra-orbital foramen, and a large plate of bone from the inner (nasal) wall of the antrum. The removal of the dead bone was followed by the immediate and complete cessation of all inflammatory symptoms; but the eye remained sightless, and the pupil rigidly fixed. About five weeks after the removal of the dead bone, it was noticed that the pupil of the affected eye moved with that of the other, under the influence of light, though vision in it had not returned. The eye was frequently examined at this stage with the ophthalmoscope. All the structures, including the retina, appeared healthy, except the termination of the optic nerve, which was perfectly white and anæmic, while that of the other eye was pink and natural.

The author referred to two other cases essentially similar to his own. The first (unpublished) occurred in the practice of Mr. Pollock, of St. George's Hospital. The patient had intense inflammation of the entire maxillary region on one side, caused by a carious tooth. It implicated the whole face and the contents of the orbit, but was not attended by "abscess" of the antrum or necrosis of bone. The inflammation completely ceased on removal of the tooth, but the sight was permanently lost; the pupil was at first fixed, but afterwards moved with that of the other eye.

Another example, closely resembling these, was published by Dr. Bruck, in Casper's "Wochenschrift" for 1851. It was, however, more chronic, and the loss of vision was only temporary.

The author concluded his paper by suggesting that the serious ophthalmic symptoms depended on the nerves of the eye being involved in a plastic inflammation in their course, external to the skull and before their distribution; that the optic nerve was permanently damaged, as shown by the permanent blindness; that the third nerve was temporarily implicated, as shown by the temporary fixedness of the pupil; and the eversion of the eye from the first seemed to indicate that the sixth nerve was less or not at all involved. Finally, the author left it an open question whether the anæmia of the optic nerve, as displayed by the ophthalmoscope, is to be looked upon as a cause or consequence of its suspended function.

Dr. Goodfellow related

TWO CASES OF EXTENSIVE ARTERIAL OBSTRUCTION FROM SEPARATED CARDIAC VEGETATIONS, FOLLOWED BY GANGRENE AND DEATH.

It was the object of the Author simply to bring these two cases before the Society, and not to enter into the general subject of arterial obstruction. The cases spoke for themselves. The extent to which the plugging took place, the number of vessels involved, the morbid changes in and around the coats of the vessels at the seat of obstruction, and the consequences which ensued, appeared to the Author to give a peculiar interest to them. In both cases vegetations of considerable size had formed on the mitral valve and surrounding surface of the endocardium. Some of these had become detached, and caused obstruction to the circulation in several of the large arterial trunks; coagula formed around them, and complete occlusion followed. The symptoms were well marked,—namely, pain, intense and agonising, at the seat of obstruction, and coldness and numbness at the distal extremities of the effected limbs, speedily followed by dry gangrene. In the first case the evidences of occlusion were observed about a month before the fatal event, and about seven days prior to the appearance of gangrene. In the second case the interval between the evidence of obstruction and the appearance of dry gangrene was shorter; the pathological changes in and around the walls of the arteries at the seat of obstruction were less extensive.

The first case was that of a woman, aged thirty, who had had an attack of acute rheumatism twelve years prior to her admission into the hospital. The heart was damaged during that attack. She, however, was enabled to follow her usual occupation, with occasional interruptions, up to a short period before the appearance of the symptoms denoting obstruction.

The second case was that of a girl, aged seventeen. She had had an attack of acute rheumatism about three years before, complicated with pneumonia, but not with heart affection. Another attack of

rheumatism occurred about eighteen months afterwards, which was complicated with endocardiits. From the time of this attack to the period of her seizure with her last fatal illness she suffered considerably from dyspnœa and frequent and severe pain in the præcordial region.

Mr. SPENCER WELLS gave a

DESCRIPTION OF A SYPHON-TROCAR FOR OVARIOTOMY AND OTHER PURPOSES.

This instrument consists of a canula, in which, instead of the ordinary solid rod, a hollow tube slides. This tube is sharpened at the end like a tubular needle. The instrument is introduced in the ordinary manner, and the sharp tube is then withdrawn by the thumb. The fluid flows along the canula to an elastic tube, which may be bent to form the long and short branches of a syphon; and the fluid continues to flow so long as the short branch is immersed, while no air can enter. If suction power be wanted, a syringe may be used instead of the simple tube. The addition of a grooved ferrule outside the canula completes the instrument for ovariotomy. The cyst, as it is emptied, is tied on the ferrule to prevent the escape of fluid, and to assist in drawing the cyst outwards. If other cysts require tapping, the sharp tube can be immediately projected and withdrawn. The power of doing this with one hand only is a great convenience, not only in performing ovariotomy, but in tapping collections of fluid through the vagina or rectum.

Instruments of various sizes, made by Messrs. Weiss, were placed on the table of the Society.

Mr. HOLMES COOTE communicated the particulars of a

CASE OF RUPTURE OF THE LEFT VENTRICLE OF THE HEART IN AN AGED FEMALE, AGED EIGHTY-TWO, WHILE RECLINING ON HER COUCH.

Her habits had been very quiet, and her diet regulated for above forty years. She was quite childish, but fond of all about her, and never gave way to temper. The substance of the heart had undergone general fatty degeneration. After referring to other cases, and to the paper by Dr. Quain, in the "Transactions" of the Society, on Fatty Degeneration of the Heart, Mr. Coote said that, in his experience, such cases were of sufficient rarity to render their collection and publication desirable.

Mr. FRENCH read a paper

ON THE SUBCUTANEOUS TREATMENT OF BOILS AND CARBUNCLES.

The author was desirous of calling attention to the fact, that subcutaneous division of the induration of the cellular membrane arrests the progress of boil and carbuncle at once. It was necessary to make crucial, and, when the disease is extensive, even three incisions across the centre, extending completely to the outer boundary of the disease—free divisions of the centre alone not being sufficient to prevent it from spreading. This plan of treatment was very convenient to the patient, whose time was valuable; and this sudden interruption to the progress of the malady was not followed by its outbreak elsewhere. Three cases were given in illustration, and several surgeons, to whom the author had suggested this method, and fully confirmed the author's experience.

Mr. PARTRIDGE said that he had lately had an opportunity of putting in practice the plan recommended by Mr. French, in a case of carbuncle of the neck. The relief was immediate and recovery rapid.

TUESDAY, JULY 1ST.

REPORT OF THE COMMITTEE APPOINTED TO INVESTIGATE THE SUBJECT OF SUSPENDED ANIMATION.

The inquiry was conducted,—

By means of experiments upon living animals;

By means of experiments upon the dead human body.

In investigating anew the subject of apnœa by means of experiments on the lower animals, it seemed expedient to observe, in the first place, the principal phenomena of apnœa in its least complicated form—namely, when produced by simply depriving the animal of air.

The principal facts to which attention was directed during the progress of the apnœa thus induced were—

The duration of the respiratory movements;

The duration of the heart's action.

The duration of the heart's action was observed—

(*a*) In relation to the duration of the respiratory movements.

(*b*) In relation to the time after the stoppage of the breathing.

From the experiments performed it appeared that in the dog the average duration of the respiratory movements after the animal has been deprived of air is 4 min. 5 sec., the extremes being 3 min. 30 sec. and 4 min. 40 sec. The average duration of the heart's action is 7 min. 11 sec., the extremes being 6 min. 40 sec. and 7 min. 45 sec.

From these experiments it appears that on an average the heart's action continues for 3 min. 15 sec. after the animal has ceased to make respiratory efforts, the extremes being 2 min. and 4 min. respectively.

Rabbits on an average ceased to make respiratory efforts in 3 min. 25 sec. Their heart's action stopped in 7 min. 10 sec.; consequently, the interval between the last respiratory effort and the cessation of the heart's action was 3 min. 45 sec.

The next question investigated was—the period after the simple deprivation of air at which recovery is possible, under natural circumstances, without the aid of any artificial means of resuscitation.

The experiments performed led to the conclusion that a dog may be deprived of air during 3 min. 50 sec., and afterwards recover without the application of artificial means; that a dog is not likely to recover, if left to itself, after having been deprived of air during 4 min. 10 sec.

The force of the inspiratory efforts during apnœa was observed in the experiments to be so great that it was determined to measure them. They were found to be capable, in the dog, of raising a column of mercury four inches. It appeared, moreover, that their force increases up to a certain period.

In other experiments, plaster-of-Paris, and even mercury, were thus drawn upwards into the minute bronchial tubes.

It is easy to understand, therefore, how foreign bodies may be drawn into the lungs in cases of drowning, and the importance of this fact in the consideration of the pathology and treatment of apnœa.

The Committee next passed on to the subject of drowning.

The first question investigated was—For what period can an animal be submerged, and yet recover without the aid of artificial means?

It was found as the result of numerous experiments on dogs that, in striking contrast to the previous ones, 1½ minutes' immersion in water suffices to destroy life.

Other experiments satisfactorily showed that the difference of time between simple apnœa and that by drowning is not due to submersion, or to depression of temperature, or to struggling, but that it is connected with the fact, that in the one case a free passage of air out of the lungs, and of water into them, is permitted; in the other, the exit of air and the entrance of water are prevented.

There can be no doubt, from other considerations put forward, that although both these circumstances are concerned in producing the difference observed, yet that it is mainly due to the entrance of water and the effects thereby produced.

The treatment of apnœa was next considered.

For conclusions respecting artificial respiration, the Committee refer to the second portion of the Report.

Many other methods of resuscitation which have been recommended were employed, including actual cautery, venesection, cold splash, alternate application of hot and cold water, galvanism, puncture of the diaphragm.

Although some of the above means were occasionally of manifest advantage, no one was of such unequivocal efficacy in a sufficient number of cases as to warrant the Committee in specially recommending its adoption.

The experiments upon the dead subject were made with a view to determine the value of the various methods which have been employed for alternately compressing and expanding the cavity of the chest in such a manner as to imitate the natural movements of the thoracic walls in breathing. The following methods have been investigated:

1. Pressure exerted by the hands on the anterior wall of the thorax, the body being in the prone posture. Such pressure has for its object, to expel a portion of the air contained in the chest: on relaxing the pressure, the chest expands and air enters.

2. The postural, or so-called "ready" method, described by Dr. Marshall Hall, which consists essentially in "turning the body gently on the side and a little beyond, and then briskly on the face alternately;" and in making pressure along the back of the chest each time the body is brought into the prone position.

3. The method of Dr. Silvester, in which the action of the pectoral and other muscles passing from the shoulders to the parietes of the chest in deep inspiration is imitated. An inspiratory effort is produced by extending the arms upwards by the sides of the head; on restoring them to their original position by the side of the body, the expanded walls are allowed to resume their previous state and expiration takes place, the quantity of air expelled being in proportion to that which had been previously inspired.

It being necessary to measure the flow of air in and out of the respiratory cavity under conditions of pressure closely resembling those which exist in natural respiration, no means of measurement could be used, which, in its working would offer any appreciable resistance to the passage of air. With this consideration in view, an instrument designed by Dr. Sanderson was employed. (The instrument was exhibited to the Society.)

General results.

1. As regards the volume of air which can be expelled from the thorax by compression of its walls, and inspired by the elastic expansion, consequent on relaxation of the pressure, it was found—

(*a*) That pressure by both hands on the lower third of the sternum in the adult male subject usually displaced from 8 to 10 inches of air.

The pressure actually exerted amounted to about 30 lbs. It was, therefore, not greater than might be safely applied to the living subject. The volume of air expelled varied from 8 cubic inches to 15 cubic inches.

(*b*) That pressure made in the same manner on the upper part of the sternum usually displaced 2 or 3 cubic inches less than pressure on the lower part.

(*c*) That pressure exerted by one hand on the upper part, by the other on the lower part of the sternum, produced about the same results as were observed in *a*.

In this case the whole amount of pressure did not exceed that exerted in *a*.

(*d*) That the pressure of a weight laid on the lower third of the sternum produced similar results according to its amount.

(*e*) That lateral pressure exerted on the ribs or costal cartilages of both sides simultaneously, was, in no instance, more effectual.

(*f*) That compression by a broad bandage encircling the chest, the ends of which were crossed over the sternum, and drawn in opposite directions by two persons, produced no greater effect than pressure with the hands on the sternum or sides.

2. As regards the whole amount of exchange of air produced by the method of Dr. Marshall Hall, "to imitate respiration," it varied much according as the subject was favourable, or the contrary; sometimes not exceeding a few cubic inches, but never exceeding 15 cubic inches.

3. As regards Dr. Silvester's method, it was found that, on extending the arms upwards, a volume of air was inspired into the chest, which varied in different subjects from 9 to 44 cubic inches, and it was observed that the results obtained in successful experiments on the same body were remarkably uniform, in which respect, as well as in their amount, they contrasted with those obtained by the method of Dr. M. Hall. On restoring the arms to the side, the quantity of air expelled was generally nearly equal to that previously inspired. Occasionally less.

In the treatment of apnœa generally, the Committee offer the following suggestions :—

That all obstruction to the passage of air to and from the lungs be at once, so far as is practicable, removed; that the mouth and nostrils, for example, be cleansed from all foreign matters or adhering mucus.

That in the absence of natural respiration, artificial respiration by Dr. Silvester's plan be forthwith employed in the following manner :—The body being laid on its back (either on a flat surface, or, better, on a plane inclined a little from the feet upwards), a firm cushion or some similar support should be placed under the shoulders, the head being kept on a line with the trunk. The tongue should be drawn forward so as to project a little from the side of the mouth. Then the arms should be drawn upwards until they nearly meet above the head (the operator grasping them just above the elbows), and then at once lowered and replaced at the side. This should be immediately followed by moderate pressure with both hands upon the lower part of the sternum. This process is to be repeated twelve or fourteen times in the minute.

That if no natural respiratory efforts supervene a dash of hot water (120 deg. Fahr.) or cold water be employed, for the purpose of exciting respiratory efforts.

That the temperature of the body be maintained by friction, warm blankets, the warm bath, &c.

In the case of drowning, in addition to the foregoing suggestions, the following plan may be in the first instance practised :—Place the body with the face downwards, and hanging a little over the edge of a table, shutter, or board, raised to an angle of about thirty degrees, so that the head may be lower than the feet. Open the mouth and draw the tongue forward. Keep the body in this posture for a few seconds, or a little longer if fluid escapes. The escape of fluid may be assisted by pressing once or twice upon the back.

On the motion of Dr. Edward Smith, the resolution of the Council appointing the Committee was read.

Dr. C. J. B. Williams said, the Committee, having to consider the subject of "Suspended Animation," directed their inquiries to that kind of interference with life which results from stoppage of the breath in suffocation, strangulation, and drowning. The first series of experiments was to investigate the result of simple apnœa, or stoppage of the breath; and for this purpose the trachea of animals was opened, and a tube inserted so as to command the supply of air; and this tube being furnished with a stop-cock could be closed, and the result noted, especially these:—After the closure of the tube, 1, how long respiratory efforts continue; 2, how long the heart's action continues; 3, how long the heart beats after the breathing efforts cease. The experiments show a considerable variety of result; but, as a general average, it may be stated that in dogs efforts at breathing continued a few seconds more than four minutes after the closure of the tube; and the heart's action three minutes and a quarter longer. The duration and force of these respiratory efforts in an animal deprived of air, were not more remarkable than important, as indicating the period within which an animal deprived of air could recover; and this was found to be almost, but not quite, as long as the duration of these efforts—that is to say, a dog deprived of air four minutes only, would recover; but if the exclusion of air lasted ten seconds longer, he did not recover. The extraordinary force of these struggles for breath was shown by plunging the end of the tube into mercury, when it was found that the inspiratory effort sometimes raised a column of four inches of mercury, and, if the tube was shorter, would draw the quicksilver in considerable quantities into the bronchial tubes and air-cells of the lungs. The next subject of investigation was suspended animation from drowning; and here the experimenters soon found a remarkable difference in the greater rapidity of the death, and the shorter time during which life is recoverable. An animal simply deprived of air for four minutes may recover; but one immersed in water for one minute and a half is irrecoverably dead. Recovery took place in several cases where the immersion lasted one minute and fifteen seconds; but fifteen seconds more made all the difference. The experimenters proceeded to search into the cause of this peculiarly destructive operation of drowning, as compared with simple privation of air; and very soon they were enabled to trace it to the action of the water itself, forcibly drawn into the lungs by the respiratory struggles of the animal. Two dogs were plunged into water, one having its trachea closed by a stop-cock at the moment of immersion. The dog with the trachea free was taken out in two minutes, irrecoverably dead. The other, with the trachea closed, was taken out at the end of four minutes; the trachea was opened, and in the course of a few seconds the animal began to gasp, and soon recovered. Another mode of diminishing the inspiratory struggles of the animal was by stupefying it with chloroform before immersion in water, and it was actually found that recovery took place after two minutes and fifteen seconds' immersion. On this point he (Dr. Williams) adverted to a popular opinion, that it is more difficult to drown a drunken man than one who is sober, as having some foundation on this fact, that insensibility of any kind retards the fatal influence of drowning, by diminishing those violent struggles for breath which, by forcing water into the lungs, soon put the case beyond recovery. But nothing so fully pointed out the extent and nature of the fatal influence of water in the lungs as the appearance of these organs in drowned animals as compared with those killed by simple apnœa. In the latter, the air-passages remained free from all secretion or effusion, and the lungs themselves were light and buoyant, and contained remarkably little blood. Now this is contrary to what is generally described as the state of the lungs in asphyxia; and probably in ordinary cases, where death is not sudden, but prolonged, more or less engorgement may take place. But here there was no engorgement or obstruction, and it was not wonderful that animals would recover more readily. But with drowned animals, not only were all the air-passages choked with frothy fluid, and that fluid generally more or less bloody, but the whole lungs were always highly engorged with blood, so that they were heavy, dark-coloured, pitted on pressure, and on being cut exuded an abundance of blood-tinged fluid with many air-bubbles in it. On this subject he would make two remarks on his own responsibility, apart from his office in the Committee. One was—How opposed these observations and conclusions are to those many years ago propounded by Goodwyn in his treatise on suspended Animation, whose opinions have generally been adopted to the present time. Goodwyn concluded from his observations, that water never to a hurtful extent enters the lungs of the drowned, and he deprecated the popular practice of hanging up a drowned person by the heels to let the water run out. He (Dr. Williams) was by no means sure that, as Dr. Goodwyn was certainly wrong in his pathology, some modification of the popular practice may not be beneficial. The other remark related to the mode in which the water which got into the lungs of the drowned proved so rapidly and extensively injurious. No doubt much was due to its mechanical pressure on the tubes and cells, forming an impervious barrier to the readmission of air; but this would not account for the extraordinary increase of blood in the lung, and its transudation into the air-tubes. He believed the injurious influence of water to be due to its chemical power of acting by endosmosis on the blood within the capillaries of the lungs, swelling up and bursting the blood-corpuscles, and causing their rapid accumulation in the organ, and their extravasation into the bronchial tubes. This was a subject for further experimental investigation, and he thought it one of great importance, as bearing on the action of water as a noxious or a therapeutic agent. He would not detail the various means of resuscitation which were tried by the Committee, but the results of the trials were not such as to induce the Committee to recommend them strongly for general adoption. Various instructive experiments were made on different modes of performing artificial respiration, and the most conclusive of these had reference to the so-called "ready methods" of Dr. Marshall Hall and Dr. Silvester. One of their Com-

mittee (Dr. Sanderson) contrived the apparatus on the table for measuring the air which could be forced out of it into the lungs of a dead body by these methods of artificial respiration; and the general result was, that by Dr. Hall's method the quantity of air moved in and out of the lungs rarely reached nine cubic inches, and never exceeded fifteen; whereas by Dr. Silvester's plan an interchange of forty cubic inches was effected; and when this method was further improved by alternating the drawing up of the arms, with depressing them, and with pressure on the lower part of the sternum, the expelled air was as much as fifty cubic inches. So far, then, as these experiments go, they show a great superiority of Dr. Silvester's over Dr. Marshall Hall's "ready method."

Dr. Edward Smith adverted to the importance of the quantity of bloody water found in the lungs of the dogs drowned, and explained that the water would be introduced from the bronchi into the bloodvessels by endosmosis, and these would cause the swelling and bursting of the blood-corpuscles after the circulation had been greatly retarded or arrested, and would also cause rupture of the capillaries, or the attenuated blood would pass through the walls by exosmosis, and thus appear in the bronchi. He did not think that the experiments upon the action of chloroform in deferring the fatal issue were conclusive, since they were too few, and the increased duration of life very small, and it had not been shown that a narcotised animal might not have greater tolerance of apnœa independent of the idea which the Committee had—the diminution of muscular effort. The matter of greatest interest in the Report was the comparision of the Marshall Hall and Silvester methods, and he (Dr. Smith) thought that both might be equally advantageous in the cases in question. The experiments have shown that, with the lungs full, there was greater change of air with the Silvester method. The Marshall Hall method started from the point of expiration, but living persons could by their effort expire forty cubic inches below that point, and if, by external pressure on the inanimate, one-half of that quantity could be displaced, it would probably suffice for the purpose in hand. The Silvester method, by enlarging the cavity of the chest above the line of expiration, must cause greater displacement of air; but it had been shown by the Report, that in a case of phthisis, where the lung capacity was greatly reduced, the effect of the two methods was precisely the same. Such would also probably be the case with drowned persons, in whom the lungs were full of water, which offered a great obstacle to the introduction of air; and in this condition the Committee had not made any experiments. It was in reference to the practical object in the appointment of the Committee that the Report failed. The Committee had not proved that any one of their inquiries was applicable to the drowned human subject. The time during which a man could be immersed in water and recover could not be proved by experiments on dogs, and the Committee themselves had shown that all their plans for the restoration of drowned dogs had failed. The Committee had, in one part of the Report, disclaimed any intention to say how far the Silvester method was fitted for the restoration of the drowned; and yet in their recommendations they advise the use of this method almost exclusively, whithout having in any experiment tried it, under these conditions. The recommendation to place the body prone, and allow fluid to run out of the mouth, was an old recommendation; but they had inferred, and not proved, its value, and that only from experiments on drowned dogs which they could not resuscitate. The experiments on dogs had shown that neither cold nor hot water alone had any value as restorative agents, but that the alternative of the two was somewhat useful; but this alternative had not been recommended for man. Hence he (Dr. Smith) regarded this Report as but the commencement of the inquiry, a labour which had elicited important facts fitted to be employed in further researches; but as to the great object had in view in the appointment of the Committee—the scientific determination of the best method for restoring drowned men—he thought that it had altogether failed.

Dr. Webster said that he thought the Silvester method was the best, and that the recommendation was very important. He was sorry to hear that the lives of so many dogs had been sacrificed in the experiments. He hoped that in future, if possible, experiments on living animals would be avoided.

Dr. Marcet agreed with Dr. Edward Smith, inasmuch as, from the method of investigation adopted by the Committee, he felt assured of the correctness of their results. He was, however, sorry that so little consideration had been given to the instrumental means of performing artificial respiration, which he believed to be of the greatest importance in a practical point of view; because, in his opinion, a much larger quantity of air was required to inflate the lungs in suspended animation than the Silvester or the Marshall Hall method could possibly effect. It was to be borne in mind that in cases of asphyxia or of poisoning by chloroform, a poisonous gas accumulated in the blood; and the object of artificial respiration was, to remove this poison and excite the action of the heart. He (Dr. Marcet) contended that in order to obtain a sufficient amount of diffusion to allow of poisonous gases to escape from the blood at the lungs, it was necessary that these organs should be inflated with as much or nearly as much air as they could contain, and this no ready method was capable of doing, as the volume of air required would be from 150 to 200 cubic inches. He believed that the instruments for performing artificial respiration should not be set aside on the ground that they cannot be had and applied quick enough when wanted, and proposed that surgeons and hospitals should provide themselves with some apparatus of ackowledged efficiency for inflating the lungs. In hospitals there would be no difficulty in carrying out this plan, so as to have in readiness a means of restoring animation in cases of accidents with chloroform. Dr. Marcet then alluded to the instrument he had exhibited to the Society on the 11th February last. He said he had obtained most satisfactory results when using it to restore animation in cases of dogs poisoned with chloroform, and that in these experiments he had been able to avoid performing tracheotomy for the purpose of inserting a canula into the trachea, which greatly added to the interest of the results. He had no doubt that this very simple instrument would prove most available in cases of suspended animation in the human individual, and concluded by observing that the instrument used by the Committee in their inquiries was one he had invented and described in 1854; it was not nearly so practical as that exhibited lately to the Society.

Mr. Charles Hunter said, that as he was one of those gentlemen who six years ago conducted the experiments upon the dead body for Dr. Marshall Hall, and upon those experiments the "Ready Method" was established, he felt called upon for a few words in its defence. He regretted that the Committee thought fit to condemn it, and observed, that if the Marshall Hall method after all was a failure, the long series of experiments carefully made by him (Mr. Hunter) with others must go for nothing; and yet the original experiments were much more numerous than those made by this Committee, and perfectly conclusive in their general results to those who made and saw them. They were, moreover, backed by astonishing evidence in its favour from medical men in all parts of the kingdom—testifying to its success in actual cases of drowning. In reply to Dr. Harley, he said the Silvester plan was tried a few times, but without success equal to that obtained by the "Ready Method." He would correct the idea that only ten cubic inches were obtained in the experiments—it was much more, and, in favourable cases, varied between twenty-five and thirty-five cubic inches, and sometimes forty inches. Mr. Hunter was glad to find his own experiments on the lungs of drowned animals, as described by him in 'The Lancet,' were corroborated by the Committee; he was also glad to hear that they did recommend the pronation of the body as the first measure in cases of drowning—it was the essential part of the Marshall Hall treatment. The special advantages of the pronation are that fluids escape from the mouth, throat, and lungs, and the tongue dropping forward leaves the glottis free during inspiration. He was sorry, then, to find that the Committee recommend the Silvester plan. He could imagine no plan so rational as the Marshall Hall method for a case of drowning. The experiments of the Committee prove that water is drawn forcibly into the lungs in drowning, and that that water hastens death; how necessary, therefore, a method of recovery that will get rid of the water! The Committee objected to the Marshall Hall method that the expiratory act precedes the inspiratory. Mr. Hunter considered it a physiological advantage, as by first inducing expiration much of the fluid is got rid of that has entered the lungs, as well as the bad air, which it is as important to get rid of as to introduce good air. He observed that frequently in his experiments artificial respiration could not be effected in the supine position, but could by pronolateral movements. He considered that in drowning cases pronation of the body should be continued some length of time, as fluid can be expelled from the lungs of a drowned individual for half an hour by the Marshall Hall method. He inquired if the Committee meant to recommend the continuous warm bath or not, as they had recorded no experiments in the Report. His own observations he considered proved it to be a most prejudicial measure, impeding respiratory action, and excluding the prone and postural movements.

Mr. Acton was sorry to hear that the opposition to the Report was more to its details than to the Report itself. He thought that the members of the Society should consider that the Committee had come forward for the first time, and that, as in the Academy of Medicine at Paris, they ought to be received with laudation. Members of the Society should not come forward, each with his own particular views, to attack the Report; and, instead of dwelling on its shortcomings, they ought to receive the labour of the Committee thankfully.

Dr. Kidd considered that artificial respiration would be valuable in restoring persons from the effects of an overdose of chloroform. He had seen cases in which pressure on the chest seemed to restore life.

Dr. C. J. B. Williams said that the experiments detailed in the Report had been made with great care, and the methods of Dr. Marshall Hall and Dr. Silvester had been fully compared. He thought that the Committee had done wisely in not recommending instruments, but what they considered to be the readiest plan under all circumstances.

JUNIOR MEDICAL SOCIETY OF LONDON.

The last meeting this session was held at Westminster Hospital, July 1st, 1862, CHRISTOPHER HEATH, Esq., V.P. in the Chair.

Mr. GANDY (Westminster Hospital), showed a "Fractured Pelvis."

Mr. HATHERLY (Westminster Hospital), "Fibroid Tumour recurrent after amputation at the Shoulder-joint."

Mr. CLARKE (Westminster Hospital), "Mr. Holt's Stricture Dilator, and a Specimen of Stricture after Operation."

Mr. HEATH (Westminster Hospital), "Cancer of Neck, involving the Trachea and Œsophagus." The same gentleman exhibited a boy suffering from spurious anchylosis of the lower jaw, caused by contraction, on the right side of cicatrices, consequent upon sloughing after scarlet fever.

MARK TANNER, Esq. (Westminster Hospital), then read a paper on "Uterine Hæmorrhage." Introducing the subject, the Author observed that it was fraught with the greatest possible interest, both on account of its frequency, the imminent danger with which it was too often attended, and the promptness and decision required to cope with it successfully. Alluding to the numerous diseases of which uterine hæmorrhage was an accompaniment, and the impossibility of considering them all in one evening, he requested their especial attention to those hæmorrhages connected with pregnancy and parturition, of which it formed the chief source of danger, whether occurring prematurely or at the full period of utero-gestation; and glancing *en passant* at the wonderful metamorphosis undergone by the lowly-organised structure, the unimpregnated womb, and the comparatively enormous size, and the muscular and highly vascular condition of the gravid uterus, he proceeded to the consideration of hæmorrhage during the non-viable period as the ordinary precursor of abortion; its various causes, maternal and ovuline, and the two methods of treatment, preventive and accelerative. Touching medicines, he remarked that opium was often administered with very indefinite notions of its *modus operandi*, which could only be by its undoubted power of controlling uterine contraction—and that whereas, in an attempt to arrest a miscarriage, opium would be a most important adjunct in our treatment; should, on the other hand, abortion be inevitable, opium would, *à priori*, be injurious. With the exception of that drug and ergot of rye, he cautioned them against too easy a belief in the action of medicines as supposed specifics in uterine hæmorrhage, but was of opinion that the so-called hæmostatics which acted beneficially did so by quieting the general circulation, and not by any direct influence. In hæmorrhage of the capillary type, the mineral and gallic acids, acetate of lead, &c., were undoubtedly important adjuvants; but in the cases now under consideration, the hæmorrhage was more akin to the surgical or traumatic bleeding, in which it proceeded from a wounded vessel no surgeon would trust to the influence of internal remedies to arrest such, and, he contended, the indications were the same; blood flowed from disrupted utero-placental vessels, and the only remedy to be trusted to was Nature's own—*i.e.*, uterine contraction which delegated the vessels by a multitude of, so to speak, living ligatures; this arrests the hæmorrhage, and stays the danger.

Dr. Tanner then proceeded to the consideration of accidental and unavoidable hæmorrhages, their diagnosis and treatment; one must not be guided in this so much by the actual amount of blood lost as by the general effect produced upon the system, bearing in mind the danger of concealed intra-uterine bleeding, on which he dwelt somewhat at length, he cautioned against temporising too long, and allowing the vital powers to become exhausted, and, alluding to the beneficial use of the Tampon in placenta prævia, contrasted with the previously urged objections to it in accidental hæmorrhage. Lastly, he described the various means used from time to time for the purpose of facilitating dilatation of the os uteri, and obviating the danger of protracted compression of the child from rupture of the membranes, the introduction of catgut bougies in partial separation of the membranes, sponge tents, Gariel's air pessary, the vaginal and intra-uterine, commenting upon the increased ratio of mortality to the child by the last method, if any reliance were to be placed in statistics, and mentioning, lastly, the invention of a water dilator, by Dr. Barnes, which appeared to be a very admirable contrivance for certain cases which he indicated. In conclusion a few observations were made upon the plan of removing the placenta before the child in placenta prævia, and the instances in which it would appear justifiable to have recourse to it.

Births, Marriages, and Deaths.

BIRTHS.

BARNES.—On the 6th inst., at Islington, Liverpool, the wife of J. H. Barnes, Esq., M.R.C.S., of a son.

BREMNER.—On the 5th inst., at Rossie House, Bridge of Earn, Perthshire, the wife of Bruce A. Bremner, M.D., of a son.

BURN.—On the 15th of May, at Hingolee, the wife of Dr. G. A. Burn, 2nd Cavalry Hydrabad Contingent, of a son.

FITZPATRICK.—On the 3rd inst., at Enniskillen, the wife of Bernard Fitzpatrick, Esq., M.R.C.S., prematurely, of a daughter, who only survived a few hours.

MARRIAGES.

EYRE—PROWSE.—On the 3rd inst., at Bath, Edmund Walter Eyre, Esq., Inspector-General of Hospitals, Madras Army, retired, to Frances, fourth daughter of the late Rev. John Arbuthnot Prowse, Bromham, Wilts.

KEDDELL—SCUDAMORE.—On the 2nd inst., at Hunton, Kent, William Frederick Keddell, Esq., M.R.C.S., of Aylesford, Kent, to Rose Anne, younger daughter of the late William R. Scudamore, Esq., Lord of the Manor of Upton-Bishop, Herefordshire.

DEATHS.

DONNELLY.—Recently, Samuel Donnelly, Staff-Surgeon, R.N. (May 16, 1842.)

HOLDEN.—May 17, Horatio Nelson Holden, Assistant-Surgeon 21st Regiment of Foot, on half-pay.

JACKSON.—On the 4th inst., Mark Wilson Jackson, F.R.C.S. Eng., L.S.A. Lond., Senior Surgeon to the Stamford and Rutland General Infirmary, of St. Martins, Stamford, Lincolnshire, aged 60.

MEDD.—On the 3rd inst., John Medd, F.R.C.S. Eng. (Hon.), L.S.A. Lond., Senior-Surgeon to the Stockport Infirmary, of the Mansion house, High street, Stockport, Cheshire, aged 57.

O'NEILL.—On the 5th inst., Thomas O'Neill, Esq., late of the Madras Medical Service, aged 66.

POWELL.—On the 2nd inst., Charles Powell, M.R.C.S. Eng., L.S.A. Lond., Haw house, Olvestone, near Thornbury, Gloucestershire.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—The following gentlemen passed the First Part of the Professional Examination for the Licence of the College, on July 4, 1862:—Vivian Wearne, St. George's Hospital; John Foot Churchill, Charing-cross Hospital; Aaron George Medwin, Guy's Hospital; Shephard Thomas Taylor, King's College; Matthew Trevan, St. Bartholomew's Hospital; Richard Douglas Powell, University College; John Blount Fry, Sydenham College, Birmingham; Alexander Bruce, University College; Arthur Evershed, Arthur George Mickley, John Jones Phillips, and Edward Whitfeld Thurston, Guy's Hospital.—Also on the 5th: Thomas Carter, Guy's Hospital; William Philipps Bingley, University College; Sedley Wolferstan, St. Bartholomew's Hospital; Frederic Thomas Hindle, Guy's Hospital; Edward Sutcliff, St. Thomas's Hospital; Frederic Long, Guy's Hospital; William Gallimore Hayden, Charing-cross Hospital.—Also on the 7th: John Foster, University College; Thomas Osmond, St. Bartholomew's Hospital; William Gill, Truro, Cornwall; Thomas Edward Williams, and Richard Luscombe Elliot, St. Bartholomew's Hospital; Henry John Hunt, King's College; Fleetwood Buckle, St. Bartholomew's Hospital.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received certificates to practise, on Thursday, July 3, 1862:—Alfred Johnson, Blossom street, York; Edward Thomas Newbold, Macclesfield; John Maugin Waters, 15 Bedford square; Thomas Jones, Llandyssil, Cardigan; Jonathan Dalgliesch, Newcastle-on-Tyne; James Allen, Bollington, Macclesfield; John Talfourd Jones, Brecon; William Sturdy Bramley, Wakefield, Yorkshire.—The following gentlemen also on the same day passed their First Examination:—Benjamin W. Pearson, St. Thomas's Hospital; Matthew Trevan, St. Bartholomew's Hospital; George Wall, Guy's Hospital.

ROYAL COLLEGE OF PHYSICIANS, EDINBURGH.—Thirty-four gentlemen received the licence of the Royal College of Physicians, Edinburgh, during the first six months of the present year.

APPOINTMENTS.—Mr. James Rolph has been appointed Surgeon to the K Division of the Police Force for the Bethnal-green district.—Mr. J. Bayley, Surgeon to the Yarmouth Royal Hospital, on retiring by rotation, has been elected Surgeon for life.—George Harvey Betts, M.D. Univ. King's Coll. Aberd., M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer and Vaccinator to the Highgate District of the Edmonton Union, Middlesex, *vice* John Franks Chittenden, M.R.C.S. Eng., L.S.A. Lond., resigned.—Mr. W. Dalrymple has been elected Dispenser to the Leicester Provident Dispensary.—Frederick Deyns, M.D. Coll. Phys. Surg. N. York, L.R.C.P. Lond., M.R.C.S. Eng., has been elected Medical Officer and Public Vaccinator for the Fenny Stratford District of the Newport Pagnell Union, Bucks, *vice* Mr. William Lucy, M.R.C.S. Eng., L.S.A. Lond., resigned.—Augustus Eves, M.D., F.R.C.S. (Hon.), has been appointed Consulting Surgeon to the Cheltenham General Hospital, on his resignation of the office of Senior Surgeon.—George Duncan Gibb, M.D. McGill Coll. Montreal, M.A., M.R.C.P. Lond., L.R.C.S. Irel. and L.M., has been appointed Physician to the West of London Hospital and Dispensary, Broadway, Hammersmith, *vice* Thomas Gordon Hake, M.D. Univ. Glasg., M.R.C.P. Lond., resigned.—Jonah Plummer, M.R.C.S. Eng., has been elected Medical Officer for District No. 3 of the York Union, *vice* John Benson Pritchett, M.R.C.S. Eng., and L.M. L.S.A. Lond., resigned.—George Goddard Rogers, M.D. St. And., M.R.C.P. Lond., M.R.C.S. Eng., has been appointed Physician to the West of London Hospital and Dispensary, *vice* John Thomas Aldridge, M.R.C.P. Lond. (exam.), M.R.C.S. Eng., appointed Senior Physician to the North Staffordshire Infirmary.—Wm. Saul, M.R.C.S. Eng., L.S.A. Lond., has been elected Surgeon to the St. Pancras Infirmary and Workhouse, *vice* William Tyeth Coster, L.R.C.P. Edin. (exam.), M.R.C.S. Eng., L.S.A. Lond., resigned.—David Skae, M.D. Univ. St. And., F.R.C.S. Edin., Medical Superintendent of the Royal Lunatic Asylum, Morningside, Edinburgh, has been elected President of the Association of Medical Officers of Asylums and Hospitals for the Insane.—John Thornhill, L.R.C.P. Edin. (exam.), M.R.C.S. Eng., has been elected Medical Officer and Public Vaccinator for the

Gosforth District of the Castle Ward Union, Northumberland, *vice* Wm. Frederick Napoleon Wilson, M.R.C.S. Eng., L.S.A. Lond., resigned.

COLLEGIATE ELECTIONS.—A special meeting of the Council of the Royal College of Surgeons of England was held on Monday, the 7th inst., to elect a member of the Court of Examiners in the vacancy occasioned by the decease of Mr. Edward Stanley. After a very sharp contest, unprecedented in the annals of the College, Mr. Francis Kiernan, F.R.S., a member of the Senate, and until recently, and for upwards of twenty years, an Examiner in the University of London, was elected. (Mr. Gilbert Wakefield Mackmurdo, of St. Thomas's Hospital, was the next senior member of the Council for the vacant Examiner's chair, but this gentleman declined to be put in nomination.) At a meeting of the Council on the 10th inst., Mr. James Luke, F.R.S., of the London Hospital, who filled the office of President in 1853, again received this honour from the hands of his colleagues, and Mr. Frederic Carpenter Skey, F.R.S., of St. Bartholomew's Hospital, and Mr. Joseph Hodgson, F.R.S., were elected Vice-Presidents for the ensuing year, the former gentleman also for the second time. Mr. Samuel Solly, F.R.S., of St. Thomas's Hospital, was appointed Professor of Human Anatomy and Surgery, and Mr. George Gulliver, F.R.S., and Mr. T. H. Huxley, F.R.S., were appointed Professors of Comparative Anatomy and Physiology. Mr. Gulliver will also deliver the Hunterian Oration on the 14th of February next.

APPOINTMENTS FOR THE WEEK.

Wednesday, July 16.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopœdic Hospital, 2 p.m.

Thursday, July 17.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

LONDON SURGICAL HOME.—*Operations:* 2 p.m. Ruptured Perineum; Fibrous Tumour of the Uterus.

Friday, July 18.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, July 19.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital, 2 p.m.

Monday, July 21.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, July 22.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

NOTICES TO CORRESPONDENTS.

CRITO.—There can be no doubt that Dr. Wilde's representation of the sad deficiencies in Dublin, in respect of hospital accommodation for ophthalmic patients was overdone. Dublin is better provided for than he states; but he is himself so blind that he can see nothing beyond the walls of St. Mark's. Perhaps Dr. Hildige or Dr. Colles will kindly couch him.

F.R.C.S. is thanked. We shall be obliged by further kindnesses.

Mr. PETER W.—It cannot be obtained now.

A CHEMICAL READER suggests that the alleged difference in the action of various samples of tincture of henbane may be due to the difference of soil in which the plants grew, causing permanent difference of characters. This is possible, but we think unlikely, on the supposition that the plants are mature. The medicinal qualities of a plant are an essential part of the plant; and if the plant be perfect and mature, should be found in it. Much more depends upon the season when the plants are gathered, the portions used, and the methods of preparation.

Mr. B. JOHNSON.—1st. No.—2nd. No.—3rd. Erichaen's.

Dr. EVANS.—Yes; note forwarded.

Dr. TURNER.—Received.

G. T.—1st. We cannot say.—2nd. There is no fixed rule; the fee is usually divided.—3rd. The Guardians are not obliged to pay a consultant in addition to the 2*l.* fee. The larger fee is intended to meet the contingency of a consultation. If they are liberal, however, they may do it.

To the Editor of the Medical Circular.

SIR,—The accompanying correspondence may probably be interesting to the Medical Officers of Workhouses, as an instance of the frivolous and vexatious proceedings to which we are subject through the fussy activity of officious officials. I am happy to say that Mr. Roberts is not the permanent auditor of this Union. The least thing the Board can do in return for his zealous efforts to carry out the "letter" of their Poor-law, and to aid in filling up the time of their numerous staff of clerks, is to present him with a handsome supply of red-tape.

Your obedient servant, H. MEYMOTT.

Ludlow, July 10, 1862.

(1.)

Poor-law Board, Whitehall, S.W., July 8, 1862.

"SIR,—I am directed by the Poor-law Board to inform you that they have received a report from Mr. Roberts, District Auditor, after his audit of the accounts of the Ludlow Union, for the half-year ended at Lady-day last, in which he makes the following observations in reference to your portion of the Workhouse Medical Relief Book:—

"Column headed Initials of Medical Officer in attendance on every case. Only entered opposite the first case in each week.

"Column headed the number of the Dietary on which placed. The column for one day only in each week filled up (said to be intended for each day of the week.)

"The Board direct me to request that they may be furnished with any explanation which you may be desirous of submitting to them upon these statements of the Auditor.

"I am, Sir, your obedient servant,

"H. FLEMING, *Secretary.*"

"H. Meymott, Esq., Medical Officer of the workhouse of the Ludlow Union, Ludlow."

(2.)

Ludlow, July 9, 1862.

"SIR,—Mr. Roberts has omitted to state that in the column for initials, in each case after the first, a mark is made corresponding to "Ditto," which has hitherto been considered amply sufficient for all practical purposes.

"With the column of the number of the Dietary no instruction is given to fill it up every day. The empty spaces are made use of, whenever the diet is changed during the week. This plan I consider far more useful in calculating the Dietary than loading the columns with a repetition of figures.". I am, Sir, &c.,

"H. MEYMOTT."

"H. Fleming, Esq., Secretary to the Poor-law Board."

M.R.C.S.—We have observed the article in the 'Lancet' on the College of Surgeons and the Medical Council. It is in apparent opposition to our views; but the opposition is only *apparent*. The article consists of abuse of Mr. Cæsar Hawkins, and nothing else. Argument there is none, and could not be any, for there was evidently no knowledge of the subject in the writer's mind. The 'Lancet' takes up topics from the necessity of noticing them; but whether it blames or praises is all a matter of chance. The automaton in the Exhibition would write quite as sensibly. Such flippant abuse hurts nobody.

ONE WHO LIKES TO KNOW ALL ABOUT IT.—1st. We do not know who is likely to be deputy coroner.—2nd. We do not know the salary; it is a matter of private arrangement.—3rd. You may be right; we shall see.—4th. Mr. Brent is a qualified man, and passed the Hall in 1852.

Dr. HAYES JACKSON is thanked.

CHIRURGUS will notice that Mr. Kiernan has been elected, Mr. Macmurdo having retired. This is a satisfactory conclusion of an arduous struggle. Our contemporaries took no part in the contest, a fact that serves to show how easy it is to do without them.

Mr. S. WILLIAMS.—Certainly not.

Mr. MEYMOTT.—Received.

A SUBSCRIBER FROM THE FIRST NUMBER.—We have read the report, and certainly think that the man ought to have been hanged. The opinion of the Medical man would have had but little weight with a Medical Coroner.

THE DEBATE ON SUSPENDED ANIMATION.

To the Editor of the Medical Circular.

SIR,—In the late debate on suspended animation with the best means of recovery from apnœa, a very general impression prevailed that in drowning cases, from the quantity of water in the lungs, even the best modes of artificial respiration are of little avail on account of this water in the air cells, the superiority of the Silvester method was, however, clearly proved. I shall feel obliged if you will permit me to correct, or explain, what is in the published report as to what I said in the debate—viz., I was disappointed as to the part of the report which spoke of galvanism, but as there was a general tendency to say this water in the air cells rendered all methods valueless, and Dr. Williams extemporised the idea that the blood corpuscles are injured by osmosis, I suggested what I know to be a fact, that in the accidents from chloroform from apnœa as there is no osmosis or water, &c., the recommendations of the committee are specially valuable, and that we wanted this authoritative analysis of the Silvester and Marshall Hall methods very much. I mentioned, four years ago, in my little book that the Marshall Hall method is not as good as this of moderate pressure on the lower part of the sternum, and what is practically the Sivester method in all accidents from chloroform, yet in one of the late acidents from chloroform the patient was rubbed with ice, and the Marshall Hall plan vigorously enforced, which of course rendered all chances of resuscitation hopeless.

I should not write this but that I see it is suggested to begin and go again over ground already well trodden, and thoroughly understood—viz., the apnœa of choloroform; the Biological Society of Paris and the late Dr. Snow have made all this subject as clear as the demonstration of the 47th proposition of the first book of Euclid is clear! What good can there come of Dr. Markham and Dr. Latham trying to set up a new demonstration of the square of the hypothenuse or apnœa? because they do not understand the latter, and will not allow those who do so to explain it. We shall simply have more deaths from chloroform by unsettling the subject.

I am, Sir, &c. CHARLES KIDD, M.D.

Sackville street, July 14.

Mr. GRIFFIN'S note and report of the inquiry into the cause of death of the late Mr. Puckett arrived too late for this number. It is sufficient now to state that Mr. Griffin is anxious to raise a fund in behalf of the survivors,—his widow and her mother and a daughter. An Account—"the Puckett fund"—has been opened at Messrs. Williams's Bank, Weymouth, and at Messrs. Elliot's Bank, Weymouth; and Mr. Richard Griffin offers to act as Treasurer. We trust his humane desire will be liberally responded to.

JOURNAL

OF

Practical Medicine and Surgery.

ART. 6253.

LEARNED SOCIETIES.

ACADEMY OF SCIENCES.—Mr. Guyon, a corresponding member, forwarded the particulars of two cases of lepra, which occurred in a tropical country, in a family of European creoles; the disease in both cases was checked by removal to a more temperate climate. The family numbered three children, one of whom had died of tubercular lepra; the other two, one of whom was an infant at the breast, having presented distinct indications of the same disease, Mr. Guyon recommended a change of climate as the measure most likely to prove beneficial, and, at his suggestion, the young patients were removed to France in 1826. Since that period, the symptoms existing at the time have remained *in statu quo*, but have not become in the slightest degree aggravated. Both subjects, moreover, are now married, and the parents of healthy children.

From these cases, Mr. Guyon concludes that it is indubitably possible to check the progress of lepra by emigration to climates in which the affection is not endemic, and that it is important to resort to this measure with as little delay as possible.

— It is not in lepra alone that change of climate proves beneficial. Mr. Guyon, in a subsequent communication, related several instances in which removal to another country effected a cure of goître.

The most interesting cases recorded by the learned author were observed amongst a band of emigrants from the Valais, in Switzerland, who landed at Algiers, in 1852, for the purpose of seeking farm-employment. Many of these persons, especially the women, were affected with bronchocele; they were forwarded to the agricultural district of Coleah, at the S. W. of Algiers, where they occupied four hamlets, called Loug-el-Abbés, Berbasse, Saïgha, and Chaiba; after a twelvemonths residence in the province, the size of the goïtrous tumours was found to have perceptibly diminished. This improvement continued during the ensuing years, and when Mr. Guyon last inspected the district (in 1856), the bronchoceles had entirely disappeared, and in some of the more aged females, calcareous nodosities had replaced the goïtre. These remarks, illustrative of the favourable influence of climate, also confirm the generally received notions as to the cause of bronchocele, and suggest the hope that the disease might perhaps be cured by emigration from localities in which it is endemically prevalent, to others, often not far distant, in which this deformity too commonly connected with cretinism, is not habitually observed.

— A highly interesting inaugural thesis was defended at the School of Medicine on the 25th of February by the author Mr. M. Raynaud. The subject is *Local Asphyxia and Symmetrical Gangrene of the Extremities.* Mr. Raynaud states that from the chemical analysis of the mortified parts, carefully made by M. Réveil, it follows that the proximate cause of gangrene is the diminution, or the entire absence of the amount of oxygen necessary for the continuance of life in the tissues.

It is a somewhat singular circumstance that this theoretical view which Mr. Raynaud defended with much ability, did not suggest to him any experiment beyond the chemical inquiry above alluded to, nor any mode of treatment consistent with the idea he has the undoubted merit of having first originated.

The perusal of this thesis, however, proved fruitful in the case of Professor Laugier, and a case of spontaneous grangrene having been admitted into the wards of this sagacious observer, he at once seized the opportunity of testing the value of Mr. Raynaud's views, and the results of clinical experiment were of so highly gratifying a character, that he thought it incumbent on him to lay them before the Academy.

In this patient, one toe was partially mortified, and the integument was painful on the instep, discoloured, and threatened with gangrene. The part was placed in an apparatus of simple construction, in which pure oxygen was uninterruptedly evolved around the diseased foot. The progress of the gangrene was promptly checked, and the parts restored to a healthy condition. The eschar of the toe fell away, and the wound is now almost entirely healed.

Another man was also admitted into the same hospital, suffering from spontaneous gangrene of the fourth and fifth toes of the left foot. The skin, up to the ankle-joint, was red, painful, and threatened with imminent mortification. The same treatment has been instituted a few days since, and the mischief is now limited to the parts first affected. The redness of the integument has faded, the pain has considerably decreased, and legitimate hopes of a favourable issue may be entertained, although this individual, like the first, is in his seventy-fifth year.

Whether Mr. Raynaud's theory be correct or not, the cases related to the Institute by Mr. Laugier supply satisfactory evidence that oxygen baths promptly check, at least in certain instances, spontaneous gangrene of the extremities.

— Messrs. Poggiale and Lambert presented to the Academy the results of the chemical analysis of the Waters of the Artesian Well at Passy. The following are the conclusions of their paper:—

1. The waters of the well at Passy closely resemble those of the Artesian well of Grenelle.
2. They contain no oxygen.
3. They are like the Grenelle waters, alkaline.
4. They contain fewer calcareous or magnesian salts than water fit for drinking.
5. The high temperature and strong flavour, the absence of air, the small quantity of free carbonic acid and of carbonate of lime, discoverable in the composition of this water, are positive objections to its use as a beverage. If intended for this purpose, it should be first cooled and properly aërated.
6. This water is preferable to spring or river water for most public uses, especially for the generation of steam, the watering of plants, and the washing of linen.

ACADEMY OF MEDICINE.—A short but animated discussion took place after the communication of a report on the waters of Forges; Mr. Tardieu had undertaken the task of reporting on an application for permission to farm the Forges spas, in the Department of Seine et Oise. Two years ago, a similar request had already been addressed to the Academy, and was rejected, on the plea that the springs of Forges supply but very common water, undistinguished by any appreciable mineralizing ingredient. It is true that at its emergence this water is cold, inodorous, insipid, and destitute of any *mineral* element. But at a short distance from its source, it collects in mud-ponds, in which it undergoes peculiar changes, and acquires *medicinal* virtues, which many Paris practitioners have taken advantage of in the treatment of scrofula. This being an acknowledged fact, Mr. Tardieu proposed that the request of the applicants be granted.

Mr. Malgaigne, supported by the greater part of the section of Pharmacy, opposed this proposition. Mr. Malgaigne denies specific value to any mineral waters whatever for the cure of scrofula, and conceives that country air and nutritious food are more efficacious than the most celebrated spas.. The chemists of the Academy, and, nominally, Mr. Châtin, conceive that it is an improper and dangerous precedent to recommend springs which do not in any respect differ from common water. This would be to authorise the sale and distribution of a mineral water which is not *mineral.*

Mr. Bussy, however, remarked that until the precise meaning of this term be quite determined, it might be preferable to use the word *medicinal*, which in no wise implies any special chemical composition. Messrs. Bouvier and Gaultier de Claubry fully agreed with Mr. Bussy, and again reminded the

Academy of the undoubted efficacy in some cases of scrofula of the *turbid* waters of Forges.

The Academy, however, showed itself somewhat disinclined to repeal its former decision, and to pass a resolution which might be construed at a future day, into an inconvenient precedent, and the conclusions of the report were therefore adopted at a small majority—viz., 23 votes against 17.

— At the same meeting a French associate member was elected. The candidates were Messrs. Goyrand, of Aix, Stoltz, of Strasburg, and Mirault, of Angers: Mr. Goyrand having obtained 44 out of 66 votes, was declared duly elected.

16 members voted for Mr. Mirault, and 6 for Mr. Stoltz.

BIBLIOGRAPHY.

Art. 6254. *Leçons d'Orthopédie Professées à la Faculté de Paris, par J. F. Malgaigne*, (Lectures on Orthopedy, Delivered at the School of Medicine of Paris, by J. F. Malgaigne,) *edited by — Guyon, M.D., and — Panas, M.D., prosectors of the Faculty; with five plates, designed by — Leveillé.* (*a*)

By the reproduction, in the present number, of the Journal of Practical Medicine and Surgery, of Mr. Nélaton's comprehensive remarks on the various elements of treatment in *morbus coxarius*, we have sufficiently shown that orthopedy has ceased to be a mere surgical *speciality*. We must, however, acknowledge that with the exception of the practical notions attainable at some of the lectures of our clinical Professors, the student desirous of acquiring information on this particular branch of science, has no other source of knowledge but the writings of authors who have exclusively devoted their time to orthopedic inquiry, and who, though doubtless perfectly competent authorities on the subject, are not always distinguished by strict scientific impartiality. To draw up an estimate of the real value and expediency of the manifold methods recommended for the cure of deformities, it would have been impossible to select a more discerning and equitable judge than Mr. Malgaigne.

The lectures now published, with the Professor's permission and co-operation, by Messrs. Guyon and Panas, show that surgeons often bestow too slight attention upon facts of every day observation. This volume presents orthopedy in its true light, and will much facilitate the study of a branch of science, which reposes on the general principles of common surgery, and which, properly investigated, may suggest valuable applications to the humblest practitioner. Mr. Malgaigne's lectures, are, therefore, for obvious reasons, highly deserving of publication. Our thanks are due to Messrs. Guyon and Panas for the labour they have undertaken, and we must also congratulate Mr. Malgaigne on having met with exponents so adequate to the task as these young practitioners, one of whom, Mr. F. Guyon, has recently been named, after a brilliant competition, Surgeon of the hospitals of Paris.

The *Lectures on Orthopedy*, the assemblage of which constitutes the volume before us, are twenty in number. The professor studies, in succession, the deviations of the fingers, caused by paralysis, muscular sections, muscular contractions, or burns; deformities of the wrist, rigidity of the elbow and shoulder. He expatiates on deformities of the toes due to burns, fibrous adhesions, &c., club-foot, stiffness of the ankle, deviations of the knees, simple stiffness and ankylosis of the tibio-femoral articulation, are then considered, and, finally, the primary and secondary dislocations of the hip-joint, deformities of the spine and chest, &c. A work of so comprehensive a nature does not readily admit of analysis or quotation, and we must confine ourselves to recommend this important publication to our readers as a valuable addition to their library, deserving of a place by the side of the *Treatise on Fractures and Dislocations*, by the same Author.

Art. 6255. *Dictionnaire de Diagnostic Medical*, (A Dictionary of Medical Diagnosis). *By E. Woillez, M.D., Physician of the Hospitals of Paris.* (*a*)

In the last century, an attempt was already made, to collect in alphabetical order, the elements of semeiology and prognosis. Michel de Tennetar, for instance, published in the seven years 1770—1777, two volumes on the signs, and the art of forseeing the issue of disease. These crude attempts are now mere curiosities interesting to the bibliographer, and Mr. Woillez's methodical exposition of medical diagnosis, at the present day, may justly lay claim to the character of a perfectly original work.

The various treatises on Pathology, says the author, merely present the reader with the elements of differential diagnosis, the descriptive particulars occupying a separate and distinct place; the scholastic form adopted for the description of disease, however excellent in itself, and useful in point of completeness, perplexes the student engaged in the solution of a clinical problem; in order to take advantage of books of reference, he must either suspect or guess the answer to the enigma propounded, and that answer first requires to be known.

The elements of correct diagnosis (from which only sound practice can derive) are closely connected with every particular of our knowledge of disease. These elements include in the first place, the existing *signs* and *symptoms*; the *precedents* which embrace the narrative of the disease, the inquiry into its causes, and occasionally the investigation of the results of previous treatment. The successive acquisition of information on these various points is the basis of *differential diagnosis*, which is but an inductive process useful for the solution of the problem, but not the entire diagnosis. This solution would be insufficient, were not the practitioner to complete his task, by a careful survey of *the seat* of the morbid phenomena, by an estimation of their *degree of intensity*, by the appreciation of *anatomical changes*, when any are present, by the discrimination of *the forms* of the disease under observation, and, finally, by the *prognostic interpretation* of the symptoms.

Such are the objects Mr. Woillez has in view in the present volume. The author has endeavoured to supply young practitioners with a guide, which, with the knowledge of the leading symptoms of a case, or of the principal seat of the morbid phenomena complained of, may lead to the discovery of the diagnosis.

Mr. Woillez is a pupil of Louis. Although partial to researches based on pure statistics, he does not reject the works of those writers who prefer the inductive method of exposition. His dictionary is unprejudiced in this respect; his bibliographic references are correct, and the publications quoted, are briefly designated, and often summarized in the most graphic manner.

Art 6256. *Des Climats sous le Rapport Hygiénique et Médical, guide pratique dons les régions du Globe les plus Propres à la Guérison des Maladies Chroniques* (Climate Hygienically and Medically considered, being a Practical Guide to the Geographical Regions most appropriate to the cure of Chronic Disease), *by L. Gigot-Suard, M.D., Consulting Physician at Cauterets.* (*b*)

The influence of climate on the human system has been known since the days of Hippocrates, and is daily evinced beneficially in chronic disease. Very recently, Dr. Guyon, formerly Inspector-General of our Military Hospitals, communicated to the Academy of Sciences, his remarks on the salutary results of change of climate in lepra and bronchocele. Emigration will, doubtless, prove equally efficacious in many other morbid conditions; but, although in goître and lepra, it may be sufficient to leave the latitudes in which these diseases are endemic, and to establish a residence in others in which they are not to be found, it is far different with many affections which require a specially selected climate, and often increase in severity in the very localities where improvement has been sought.

A frequent witness to these cruel deceptions, Mr. Gigot-Suard, has published, for the benefit of the profession and of

(*a*) One vol., 8vo., pp. 434, Adrien Delahaye, Paris.

(*a*) One vol., 8vo, pp. 932. J. B. Baillière and Son, Paris.
(*b*) One vol., 8vo., pp. 600. J. B. Bailliere and Son, Paris.

the ailing, the results of his inquiries on climate, at first undertaken without any view to publication, but which now, enriched by the observations of Clark, Taylor, Schow, &c., assume the proportions of a useful practical guide.

What Mr. Carrière has accomplished for the localities situated on the northern coast of the Mediterranean, Mr. Gigot-Suard now endeavours to do for all the countries of the globe, supposed to promote the cure of chronic diseases. The volume before us includes, in this respect, a survey of France, Switzerland, Italy, Algeria, Egypt, Spain, and Portugal. A second volume will be devoted to other climates, and especially to tropical latitudes; but, such as it is, Mr. Gigot-Suard's work complete, and is amply sufficient for the requirements of most readers. The author lays especial stress on the reasons which should induce, in predetermined cases, a preference for one locality over another. "It is not unimportant," says he "to discriminate the shades of difference between climates which may be in general classed under the same head: thus, although much analogy assuredly exists between the climateric conditions of Nice and Hyères, of Venice and Mantua, yet they do not satisfy precisely the same indications, and, in some instances, one of these stations will present considerable advantages over the other."

The author on these various points is perfectly explicit. Mr. Gigot-Suard takes note of the social and other resources open to invalids in each residence, and views them as possessed of considerable influence on the effects of treatment. Other details of much interest to persons compelled to travel for the benefit of their health, such as the means of conveyance, selection and price of lodgings, currency, &c., Mr. Gigot-Suard treats of in an appendix, which adds to the practical value of the work, and will, doubtless, be found extremely convenient in many instances.

Art. 6257. *Traité Pratique des Dermatoses, Classées d'Après la Methode Naturelle, suivi d'un Formulaire Spécial, et d'une Etude sur le Choix des Eaux Minérales dans le Traitement des Maladies de la Peau,* (A Practical Treatise of Diseases of the Skin, Classified according to the Natural Arrangement, with an Appendix of Special Formulæ, and Remarks on the Choice of Mineral Waters in the Treatment of Cutaneous Affections), *by L. V. Duchesne-Duparc, M.D. (a)*

The first edition of this work appeared in 1859, and as might have been surmised, it has been speedily exhausted. A second edition is now presented to the public, enlarged by the addition of an inquiry on the use of mineral waters in the treatment of affections of the skin.

This appendage will, doubtless, be received with due favour, for mineral waters supply the therapeutist with many valuable resources in cutaneous disease, and deserve distinct notice. In order to facilitate the intelligence of the subject, the author distributes mineral waters into classes designated by their principal ingredients, and separately studies the *sulphurous, acidulous, alkaline, saline, and ferruginous spas.* Each class is again sub-divided into two sections, according as the waters are cold or thermal.

However favourable may be the influence of mineral waters in affections of the skin, Mr. Duchesne-Duparc does not overrate their importance. He states that, alone they may entirely cure accidental, circumscribed, and recent dermatosis; that they are of the greatest assistance in the management of diseases connected with a constitutional taint, but he admits that they are often unavailing in the case of affections transmitted hereditarily, or aggravated by previous incomplete or injudicious treatment. But even in this instance, their influence is undeniable, and they powerfully contribute, with other measures, in removing from the system the last dregs of the evil.

Mr. Duchesne-Duparc opines that many skin diseases are susceptible of being radically cured, and that they always admit of improvement and alleviation. His long experience of the subject, and his conscientious researches on the comparative value of the different medications in use, must secure attention to a work which professes to point out the safest, and most effectual methods of treatment.

ON THE PROXIMATE CAUSE OF CONSUMPTION AND ITS SPECIFIC TREATMENT BY THE HYPOPHOSPHITES.

By J. FRANCIS CHURCHILL, M.D. (Paris).

No. XII.

REPORTS OF CASES TREATED SUCCESSFULLY IN THE THIRD STAGE (THAT OF EXCAVATION). *(c)*

Case XXII—Phthisis in the Third Stage.

Previous duration.—Eight years.

Symptoms.—Cough; expectoration; debility; emaciation; fever and rigors; night sweats; difficulty in lying down; loss of appetite; vomiting.

Lesion.—Softened tubercles at apex of left lung; tubercles scattered over the rest of both lungs; formation of a cavity during the treatment.

Result of Treatment.—Persistence of signs of excavation; almost total disappearance of the general symptoms.

Duration of Treatment.—Thirteen months, with interruptions.

J. G——, æt. twenty-seven, unmarried, a shopman.

April 23rd, 1858.—Patient has coughed for eight years past, little in summer, but more in winter. During the last week he has become much worse; the cough is much more frequent, with abundant muco-purulent expectoration; has never had hæmoptysis; for the last two months has felt his strength gradually decline, and has lost much flesh within the year; has fever and rigors, with profuse night sweats; sleeps tolerably well, but cannot lie on his back; suffers from dyspnœa when walking; has no appetite and vomits, but his digestion is pretty good; neither diarrhœa nor colics; has continued attending to business; pulse 88, strong and full.

Local signs.—In front, on percussion, diminished resonance below the left clavicle for about two fingers' breadth. On auscultation, of the left side above the clavicle, coarse respiration and exaggerated resonance of voice; below, coarse respiration, with prolonged expiration for about four fingers' breadth; lower still, numerous dry crepitus down to base; increased resonance of voice. On the right, normal respiration, except a few dry crepitus at the base. Posteriorly, on percussion, new resonance slightly diminished on the left side. On auscultation, on the left, numerous moist rattles throughout the whole height. On the right, similar rattles at the base. In the fossa supra-spinata, considerable resonance of voice.

Diagnosis.—Softening tubercles at the apex of left lung, and scattered throughout both lungs; bronchitis.

Treatment.—An emetic.

April 26th.—Cough somewhat relieved.

Treatment.—A potion with antimonii oxysulphuration.

June 11th.—Cough increased.

Treatment.—Hypophosphite of soda, viij. gr., daily.

June 21st.—Cough the same; expectoration slightly increased, but appetite has become very good; pulse 72, regular and full.

Treatment.—Hypophosphite of soda, xvj. gr., daily.

June 30th.—Feels better; cough less troublesome; pulse 76, regular and full.

Treatment.—Hypophosphite of soda, viij. gr., daily.

July 19th.—Continues to improve.

August 20th.—Has left off the treatment for a week, since which cough has become much worse, with increased dyspnœa.

Treatment.—Hypophosphite of soda, xvj. gr., daily.

August 30th.—Cough again diminished, and patient going on well; pulse 60, regular. Same treatment.

Oct. 8th.—The patient has again ceased coming to the dispensary, and has left off the treatment since the 10th of last month, considering himself well, as he had passed a week without coughing once; since then, however, the cough has again become frequent, and the dyspnœa much increased. He had now a numerous tracheal *râle*, audible at a distance. Pulse 88.

Treatment.—Hypophosphite of lime, viij. gr., daily.

Oct. 20.—Expectoration more abundant, but easier; the tracheal *râle* still audible. Pulse 72, rather weak.

Local signs.—In front, on percussion, complete dulness above the left clavicle, and below for about three fingers' breadth. Imperfect inspiratory expansion of left side of thorax. On auscultation of the left side, above the clavicle, cavernous respiration; numerous gurglings during cough; pectoriloquy. Below the clavicle, a mixture of moist and dry cracklings; rubbing sound; increased resonance of voice and cough; dry cracklings throughout the rest of lung. On the right side above the clavicle, sub-crepitant *râle* during

(c) Translated from the second edition of my work, 'De la Cause Immédiate de la Phthisie Pulmonaire.' In the Press.

expiration; same phenomenon below the clavicle for about two fingers' breadth; increased vocal resonance over the same space. Below, coarse respiration and increased vocal resonance. Posteriorly, on percussion, diminished resonance in the left fossa infra spinata. On auscultation, on the left, in the fossa supra-spinata, large moist cracklings, increasing during cough; increased resonance of voice and cough; same signs in the fossa infra-spinata; at the base, rubbing sound, with increased vocal resonance and numerous moist cracklings; gurglings during cough; same phenomenon in the axilla. On the right, in the fossa supra-spinata, weak respiration, with slight vocal resonance.

Treatment.—Hypophosphite of soda, xvj. gr., daily.

Oct. 25th.—Has coughed less; the expectoration is muco-purulent, not very abundant, and frothy; the dyspnœa has diminished; pulse 96, regular, moderately full.

℞ 1. Sodæ hypophos., gr. xvj., daily.
2. Syrup ipecac., ℥ij.

A tablespoonful every other day.

This examination fully confirms the diagnosis of April 23rd, and also shows that, in the interval, an excavation has formed at the apex of left lung.

Nov. 24th.—Cough more frequent; pulse 96, regular, but rather weak.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Dec. 1st.—Cough and expectoration do not diminish; tracheal *râle* still audible, even at a distance; no night-sweats; pulse 84.

Treatment.—Hypophosphite of lime, gr. xvj., daily; an emetic.

Dec. 10th.—The difficulty of breathing has diminished, but cough has undergone no change; pulse 72, regular, moderately full. Same treatment after four days' suspension.

Dec. 22nd.—The *râle* has diminished; pulse, 80, regular, moderately full. The specific treatment to be continued at the same doses.

Jan 5th, 1859.—The cough continues moderate; night-sweats have not yet reappeared; pulse 96, regular, but weak.

Treatment.—Hypophosphite of lime, gr. viij., daily.

Jan. 17th.—Says he is getting on well; the cough and oppression are moderate; appetite good; neither night-sweats nor fever; the tracheal *râle* still audible; pulse 88, regular, and moderately full. The same treatment.

Feb. 9th.—Says he now coughs but very little. Treatment as before, after five days' suspension.

Feb. 28th.—Cough still of rare occurrence; little expectoration; no night-sweats; has ceased losing flesh; respiration still rather short; pulse 60, regular, and moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

March 16th.—Patient continues to do well; strength and appetite both good, and he coughs very little; pulse, 72. Treatment as before.

Sept. 12th.—Still continues well, and coughs but seldom; pulse, 60, regular, and moderately full.

Treatment.—Hypophosphite of soda, gr. viij., every other day.

Oct. 17th.—Continues well; pulse, 60, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Jan. 9th, 1860.—General symptoms have all disappeared; says he is able to attend to business as well as before his illness; pulse 80, regular and full.

March 12th.—General state still continues satisfactory; pulse 84. On auscultation, in front, on the left, blowing respiration; a few cracklings after the cough; imperfect pectoriloquy. Behind, on the same side, a few dry rattles. On the right, both before and behind, normal respiration.

Treatment.—Hypophosphite of soda, gr. viij., daily.

From this date the patient ceased to attend the dispensary, but he was seen in February, 1861. Except a little cough in the morning, he was then perfectly well; has recovered his strength and flesh, and had become an omnibus conductor. He says that he discontinued his attendance at the dispensary because he feels quite well, and cannot spare time to do so.

Case XXIII.—Phthisis in the Third Stage.

Previous duration.—Two years.

Symptoms.—Disease hereditary; great weakness; emaciation; fever and rigors; night sweats; thoracic pains; sleeplessness; great dyspnœa; cough; expectoration; hæmoptysis; vomiting; dyspepsia; colics; occasional diarrhœa.

Lesion.—Excavation, occupying nearly the whole extent of right lung.

Result of Treatment.—Persistence of physical signs of excavation; complete disappearance of general symptoms.

Duration of Treatment.—Five months and a half.

André V——, æt. 44, married, a carriage polisher.

June 16th, 1858.—Patient says that his father died of bronchitis, and a brother and sister of scrofulous affections. His present complaint came on about two years ago, but all the symptoms have become much worse within the last six months. The weakness has greatly increased, and he has lost much flesh; has fever in the evening, sometimes with rigors. Sweats profusely at night; complains of pains between the shoulders, but experiences no difficulty in lying down. Sleep unsound and agitated. Is very short of breath, and has a tracheal *râle* audible at a distance. Cough frequent, with abundant muco-puruleut expecteration. Has spit blood three or four times, but in small quantities. Epistaxis seldom occurs now, though very frequent previously. Appetite has been rather better for some time past. Vomiting frequent a month or two ago, but not so often now; not more than three or four times a week. Digestion laborious. Colics frequent. Was troubled with diarrhœa for six weeks at the commencement of his illness, but it has ceased during the last three months. He has not been able to work since last December; pulse, 86.

On examination, I noted as follows:—The patient presents numerous cicatrices of suppurated cervical glands; the expansion of the thorax imperfect, especially on the right side; in front, on percussion, well marked dulness, below the right clavicle, for about three fingers' breadth; supra-clavicular dulness also well marked. On auscultation, on the left, below the clavicle, a few cracklings almost masked by the tracheal *râle*. No resonance of voice or cough. On the right, below the clavicle, and on the inner side, very coarse and blowing respiration, with considerable resonance of the voice and cough; in the rest of the lung, respiration pretty clear. On percussion behind, great dulness in the right fossa supra-spinata, and all the way down very marked, especially towards the base. The right fossa supra-spinata is more depressed than the corresponding one on the left. On auscultation, on the right, in the fossa supra-spinata amphoric respiration; imperfect pectoriloquy and gurglings during the cough. In the rest of the lung, cavernous respiration, accompanied with slight gurgling. At the base, a few rubbing sounds. In this patient the heart was on the right hand side, the impulse of the apex being seen below the right nipple. Between the fifth and six ribs, sounds normal.

Diagnosis.—Large excavation, occupying considerable extent of the right lung.

Treatment.—Hypophosphite of soda, gr. viij., daily.

June 25th.—He now scarcely sweats at all at night; says he feels less difficulty of breathing; has not vomited, but has had a little diarrhœa; pulse, 86.

℞.—1. Sodæ hypophos. gr. viij., daily.
2. Quinæ hypophos. gr. v.

For six pills, one to be taken every night.

July 28th.—The diarrhœa has ceased, but says he has had several bloody stools, and that he spat blood yesterday; pulse, 84, regular, and moderately full.

Treatment.—Hypophosphite of quinine, gr. v., for six pills, one every night.

July 9th.—The diarrhœa, which had returned, has again ceased for the last three days; the intestinal hæmorrhage has ceased; vomits a little in the morning; has recommenced doing a little work.

Treatment.—Hypophosphite of soda, gr. viij., daily.

July 16th.—Cough still frequent, but the difficulty of breathing has diminished.

Treatment.—Hypophosphite of soda, gr. xvj. daily.

August 2nd.—Appetite has fallen off; has had some fever, and been obliged to refrain from working; complains of a feeling of heaviness in the head, with nausea, and flying pains in every part of the body.

Treatment.—An emetic.

August 6th.—Has vomited three times; fever less intense; pulse, 80. No treatment.

August 9th.—Strength continues to increase; pulse, 80, regular, and rather full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

August 16th.—Has again had hæmoptysis; pulse 84, regular, rather full.

℞.—Ergotine, gr. xvj., daily.

August 20th.—The hæmoptysis has ceased after two days; still spits a good deal, but his strength continues to increase; pulse, 80.

℞.—1. Calci hypophos., gr. ijss., daily.
2. Aluminæ hypophos. gr. ½ daily.

Sept. 13th.—About two ounces of muco-purulent expectoration daily; night-sweats have almost ceased; appetite, good; pulse, 80, regular, rather full.

Treatment.—Hypophosphite of soda, gr. ij., daily.

Sept. 27th.—Had diarrhœa for the last three days after fatigue at work; pulse, 80, regular, rather full.

℞.—Bismuth subnitrat., ℈ ijss.
Extract. opii., gr. j.

Oct. 6th.—The diarrhœa has ceased for the last five or six days; he has caught cold in working, and coughs more; no night-sweats; no vomiting; appetite, good; pulse, 80, regular, rather weak.

℞ 1. Sodæ hypophos., gr. viij., daily.
2. Antimon. oxysulphuret., Extract. opii, āā gr. jss.
Ft. pilul. v. One every night.

Oct. 22nd.—No treatment for the last ten days; for the last

week has coughed and expectorated rather more, but has no night-sweats, and appetite is good. Is now able to work ten hours a day. Pulse 80, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Nov. 5th.—Pulse 72, regular, moderately full.

Local signs.—In front, scarcely any inspiratory expansion of the right side of thorax. On percussion, dulness above the right clavicle, and below for three fingers' breadth. On auscultation below the left clavicle, weak respiration. On the right, above the clavicle, cavernous respiration; perfect pectoriloquy; great resonance of cough; a few gurglings. Below the clavicle, distant cavernous respiration; no gurglings; slight resonance of voice and cough. In lower two-thirds, respiration rather coarse. Behind, on percussion, complete dulness in the right fossæ supra-et-infra-spinata. On auscultation, on the left, in the fossa supra-spinata, one or two sibilant *râles;* a few distant cracklings, without resonance of voice or cough. On the right, in the fossa supra-spinata, very coarse respiration, resonance of voice and cough. In the fossa infra-spinata, course respiration; cracklings during cough, loud cavernous respiration without gurglings; cavernous cough; imperfect pectoriloquy.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Dec. 15th.—The improvement continues. He is now able to work at the Opera Comique as a scene-shifter, and it often happens, he says, that he has to go up to the seventh floor five or six times a day with a hundred-weight on his shoulder, and to work late at night. Pulse 96, regular, moderately full.

The same treatment.

Jan. 14, 1859.—Having overworked himself, the cough and expectoration have increased. When he first came to the dispensary, he weighed 102 pounds; he now weighs 108. When most robust he never weighed above 114 pounds. Pulse 84.

Treatment.—An emetic.

Feb. 18th.—Complains of a pain in the left side. Pulse 80.

Treatment.—A blister loco dolenti.

Feb. 23rd.—The pain has not yet disappeared; he coughs more, and has had slight epistaxis. On auscultation over seat of pain, rubbing sound; bronchial respiration; and increased vocal resonance.

Treatment.—Extract. aconit: gr. ij., every night.

Feb. 25th.—The pain has diminished, and, in other respects, he says that he feels quite well.

Extract. aconit. gr. iv., daily.

March 16th.—He feels well, and says that he has been able to go up ten floors six times in the same day with a weight of 120 pounds. Appetite very good; scarcely coughs at all, and has no dyspnœa. He is gaining flesh, but complains of rheumatic pains in the back and loins. Pulse 72. No treatment.

April 27th.—Still coughs and expectorates a little. Pulse 76, regular, moderately full.

Treatment.—An emetic. Hypophosphite of soda, gr. viij., daily.

May 25th.—Says he expectorates rather abundantly. On auscultation, in front, on the right, moist rattles at base, with increased vocal resonance. Pulse 80, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

June 27th.—Complains of general uneasiness and has had slight hæmoptysis; but nevertheless, feels pretty tolerably well. Pulse 72.

Treatment.—An emetic.

July 11th.—Is again going on well. Pulse 84, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., for two consecutive days, after an interval of three days.

Sept. 26th.—He continues well. Pulse 72, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., every three days.

Oct. 24th.—Is now perfectly well, except slight cough.

Treatment.—Hypophosphite of lime, gr. viij., twice a week.

Feb. 20th, 1860.—Has expectorated about a wine-glassful of blood; but the hæmoptysis has now nearly ceased. Pulse 76.

Treatment.—An emetic.

April 16th.—Patient complains of piles; had never had them before. Has now returned to his old trade of polishing.

Treatment.—Hypophosphite of soda, gr. viij., every four days.

May 21st.—Well-marked depression of the right sub-clavicular region. Diminished inspiratory expansion of right side.

Local signs — In front, on percussion, dulness above the right clavicle; below, a well-marked diminution of resonance for three fingers' breadth, less perceptible. On auscultation, on the left, normal respiration throughout the whole extent. On the right, in the supra-clavicular region, cavernous respiration without rattles or crackings; imperfect pectoriloquy. In the sub-clavicular region, blowing respiration with increased vocal resonance, but neither rattles nor cracklings. The apex of the heart beats just below the right nipple, between the fifth and sixth rib. Heart sounds normal. Behind, the right shoulder, during inspiration, rises less than the left. On percussion, diminished resonance over the whole extent of the right side. On auscultation, respiration normal in every part of the left side. On the right, in the fossa-supra-spinata and the intra-scapular region, cavernous respiration, with bronchophony and great resonance of cough, but neither *râles* nor crepitations of any kind.

January, 1861.—The patient continues to enjoy good health, and works at his first trade of carriage polisher. He still continues the specific treatment in phylactic doses.

1862.—I have not seen this patient of late, but know that he continues in perfect health.

(To be continued.)

ON "RENNET WINE."

By GEORGE ELLIS, M.B., F.R.C.S.I.

That a supply of good gastric juice to the stomach, after its reception of food, is indispensable for healthy gastric digestion, is a truth that needs but little comment. Defect in quality of this fluid may be considered one of the most frequent starting points, often overlooked as such, of many diseases which surely, though it may be slowly, undermine the constitution and shorten life. Few of us are entirely exempt from some of the immediate consequences of unhealthiness in this secretion. Acid eructations, gastralgia, thirst, foul tongue, vertigo, headache, and nausea, are, under the name of dyspepsia, among the commonest affections treated by medical men in themselves and others; and the consciousness of the want of some substitute or corrective, better than any of our present Pharmacopœia can offer, has led to the very extensive trial of a costly preparation, still prescribed pretty largely, under the supposition that it contains the active principle of the gastric juice. Of this preparation, called pepsine, I can only say that, having tried it more than once, I have failed to detect its utility. It will not coagulate milk, and as to any digestive action on the food, I suspect there are few practitioners who, though continuing to prescribe it, do not feel inclined, from their own experience, to question its efficacy.

About two years since, failing to obtain benefit from this new remedy, I had recourse to the direct preparation of a solution of gastric juice from the calf's stomach; and I have found the result so gratifying, its effect in gastric derangements so satisfactory and remarkable, both in my own hands and in those of several medical friends to whom I recommended it, that I wish to communicate to the profession, more extensively, the following mode of preparation which, after many trials, appears to me to be the simplest and most convenient for general prescribing purposes. Take the stomach, or rennet bag, as it is called, of a calf *fresh* from the butcher; cut off about three inches of the upper or cardiac extremity, which portion, as it contains fewer glandular follicles, may be thrown away; slit up the stomach longitudinally; wipe it gently with a dry napkin, taking care to remove as little of the clean mucus as possible; then cut it into small pieces (the smaller the better), and put all into a common wine bottle; fill up the bottle with good sherry, and let it remain corked for three weeks. At the end of this time it is fit for use.

Dose.—One teaspoonful in a wineglassful of water immediately after meals.

Test of Quality.—One teaspoonful will solidify, to the consistency of blanc mange, in from one or two minutes, a cup of milk (about eight ounces) at the temperature of 100 deg. Fahr.

In this action on the casein of the milk, it may be said that the wine itself might have some effect. This, however, cannot be the case, as wine will not solidify milk, and it will only curdle it at a much higher temperature and in larger proportion.

This preparation, which I propose to call "rennet wine," has many advantages over the watery infusion of rennet which is obtained from the dried and salted calf's stomach (used largely in cheese-making. The objections to the latter are, that it is much more troublesome to prepare, and becomes very soon spoiled in warm weather when it begins to react on the animal matter contained in it. Rennet wine, on the contrary, is so easily made, requiring no drying or salting of the stomach, is so inexpensive, and can be so easily prescribed in private and hospital practice, that I have little doubt if known and tried it would become a very highly valued remedial article in the hands of the profession, and would take a permanent place on the shelves of the apothecary.

I recommend the employment of good sherry, because this wine has sufficient body to keep the infusion sound for any length of time, and is not so strong in alcohol as to interfere with its power of taking up the active principle of the rennet.

To the physiologist it is unnecessary to say that it should be given *after* or *during*, and not before meals. A single dose given daily after dinner will be found quite sufficient to act speedily and effectively, without other treatment, in the common run of cases of functional disorder of the stomach. It is not, perhaps, easy to explain the operation of this small quantity when we consider the large supply of the gastric secretion required for the thorough digestion of an ordinary meal The action is probably due to those indirect

chemical changes called catalytic transformations, which some organic substances, by their mere presence and contact, induce in each other and in other proximate principles. Thus the conversion of a small portion of food in the stomach into healthy albuminose by this small quantity of sound gastric juice may induce the same healthy action throughout the stomach contents during the entire process of stomach digestion. It is at least equally difficult to explain the action and rapid extension of ferments generally in their appropriate solutions. I have often been forcibly struck by the magical effect of this small dose in removing offensive odour from the breath of young persons—a distressing symptom sometimes aggravated rather than relieved by purgative medicine; and I may also mention that in one of these cases cod-liver oil was easily tolerated afterwards though never before.

It would be a mistake, however, to suppose that oil is at all acted on by the gastric juice. The oil globules of coagulated milk are seen under the microscope, unchanged, though imbedded in the solidified casein, the digestion of oil being entirely intestinal. But intestinal digestion itself must surely be influenced essentially by the healthy preparatory action of the stomach secretion on the albuminous compounds presented to it, and thus the digestion of oils and fatty matters, though not commenced in the stomach, will be indirectly facilitated by their being mingled with the products of the healthy gastric operation, when submitted subsequently to the action of the pancreas and liver.

It is unnecessary, however, at present, to theorize further on the subject. My object is to bring to the notice of the profession, and have subjected to the test of larger experience, a preparation which in my very limited sphere I have found extremely serviceable; and as I believe there is no class in society more liable to suffer from gastric disturbance, often long-continued, with wasting and debility, than members of our own profession, through worry of mind and body, with irregular hours for meals and sleep, I would earnestly suggest their, at least experimental adoption of this remedy, at once so simple, so little costly, and, which is no trifling recommendation, so perfectly innocuous.—'Dublin Medical Press.'

DILATATION OF STRICTURES IN THE URETHRA, WITH A NEW INSTRUMENT.

By J. H. HOBART BURGE, M.D.

Delivered before the Members of the Kings' County Medical Society.

Mr. President and Gentlemen,

Some months ago I had the pleasure of presenting to this Society a new instrument for the dilatation of strictures in the urethra. Since then I have so much improved upon my own device, that I hope there is no presumption in bringing it again to your especial notice. To render the subject intelligible to those members who were not present on the former occasion, I will repeat very concisely what I then said. Recognising the danger of introducing very small instruments into the urethra, and the consequent importance of using the largest that will pass without violence, I attempted to show that in actual practice the greatest obstacle to success was to be found in the inefficiency of the mechanical means at our command; that, in order to decide what instrument was of the proper size to enter or pass the stricture, it was necessary to try successively several sizes, of course irritating the sensitive parts more and more at each introduction and withdrawal, or else, on the other hand, to select one so minute as to endanger the integrity of the mucous lining of the canal, and perhaps increase the difficulty we were called to relieve. It then became obvious that the great desideratum was an instrument which would enable us to feel our way safely from point to point, changing its size as occasion might require, without danger to any part, and obviating entirely the necessity of withdrawing it till the operation was completed. This was the problem which I proposed to myself, and the solution of it is in the instrument which I now exhibit. It consists of several concentric cylinders, curved in the arc of a circle. The external or largest cylinder being about the size of No. 10 catheter, and the internal or smallest about the size of No. 2. The smaller sizes are all projected at will by means of the knobs near the handle. The design is to carry the instrument *in full size* to the point of stricture. The moment the obstruction is felt, the largest of the *contained* cylinders is to be advanced till it in turn meets with some obstruction, when, in like manner, the next size must be pushed forward, and so on, always from *larger* to *smaller*, till the stricture is passed. To prevent misapprehension, I contrasted this instrument with that of Whakely, which consists of a style and several separate cylinders; the design being, first, to introduce the style, and then, successively, the cylinders upon the style, always proceeding from *smaller* to *larger*; which instrument, though it possesses some advantages over the ordinary bougies, inasmuch as it obviates the necessity of frequent introduction and withdrawal, is practically the exact opposite of mine, and involves all the danger of injury to the passage which attends the use of a fine instrument with nothing to guide it in the way it should go. To be sure, the style once introduced is a sure guide to the cylinders sliding thereon; but the difficulty consists in safely introducing the style which of necessity is very small. It is clear to my mind, that even in those cases in which recourse must be had to the finest instruments ever used, there is great advantage in gently dilating the canal all the way down to the stricture, and especially just where the contraction begins, thus removing any folds of membrane which might otherwise engage the point of your instrument. By the larger cylinders of this multiple bougie, this dilatation is effected and maintained, while the smaller are safely guided by them in the proper direction. When I first asked your attention to this instrument, a style occupied its centre, and filled completely the smallest of these cylinders. *That* I have caused to be removed, and a bore to be made in the handle continuous with the canal thus formed, so that when the stricture is passed, the patient may have instant relief from a distended bladder. Lest the smallest of these cylinders should prove, as it sometimes doubtless will, too large to enter, I have provided an independent style of sufficient length to pass through the handle and emerge at the point. This, of course, is to be used without withdrawing the instrument. If the use of the style become necessary in a given case, and with it we succeed in passing the stricture, there can hardly be any difficulty in sliding upon it the smallest cylinder, after which the style may be immediately withdrawn and the urine allowed to escape. It will at once occur to you that many strictures occasion a tortuosity of the urethra, and that a firm metallic bougie cannot be made to follow these unnatural windings. To obviate this difficulty, I have suggested to Messrs. Tiemann and Co. to provide with each instrument some long, flexible bougies, small enough to enter the bore of this.

Some may ask, if we must resort to a flexible instrument, why not do so without the intervention of the metallic? I answer, because the metallic acts as a *sure* guide down to the very seat of the difficulty, and keeps all folds of mucous membrane from obstructing and turning back the point of the flexible. There is but one more division of my subject which I propose to mention, and you will excuse me for introducing it with words of warning.

Cases of stricture do occur in which all simple means of relief fail, though I believe the patience of a patient man should be exhausted before the more heroic measures are adopted. If, then, after faithful and ineffectual trial of all means, both local and general, the surgeon deem it advisable to divide the stricture, I have made provision for that necessity in this instrument. A second style is furnished, in size and length corresponding to that already described, and differing from it only in having a cutting extremity. This is to be introduced through the handle while the main instrument is held as a guide to the strictured part. God forbid that I should recommend any measure so fraught with danger as this, without throwing around it all possible safeguards. Let it, then, be distinctly understood, that this is to be held in reserve for extreme cases, and always as a *dernier ressort*, and that the part to be divided is to be first fairly reached by advancing the cylinders from larger to smaller, as already described; and lastly, that the operator decide in advance how far his incision shall extend, and guage his instrument accordingly, by means of the revolving nut arranged for that purpose upon the handle.

Having been informed that Drs. Alexander B. Mott and George T. Elliott, jun., were using this instrument for the cervix uteri, thereby giving it a wider range of usefulness than I had anticipated for it, I addressed a note to each, asking the result of his experience. From Dr. Mott I have not yet received an answer. Dr. Elliott writes as follow: "It affords me great pleasure to say that I have found it useful as a dilator of the uterine cervix. In one case of dysmenorrhœa its effects were very happy indeed."

This instrument is manufactured and sold by George Tiemann and Co., 63 Chatham street, New York, who will furnish a shorter variety expressly for the cervix uteri.

OUR NOTE BOOK.

ANOTHER CASE OF OVARIOTOMY.

This operation is in a fair way of becoming a favourite one with French Surgeons. Another successful case of it has just occurred at Strasbourg. The patient was a married woman, aged twenty-six, who first began to suffer about two years ago. The enlargement of the abdomen soon became very considerable, and the patient weak and emaciated. The relative advantages of tapping and ovariotomy having been expounded to her, she decided for the latter, and was operated on by M. Kœberle, on June 2. The operation lasted three-quarters of an hour, there being rather firm adhesions; and it was done much in the usual manner. After it had been finished, two bags filled with ice were placed on the incision, where they were kept on during eleven days. The patient vomited a good deal for the first day or two, and was consequently given two-thirds of a grain of morphia for eight days consecutively

In order to arrest the putrefaction of the pedicle, perchloride of iron was applied to it, whereupon it became quite dry. The pedicle came away on the thirteenth day after operation. On the fourth day there was considerable tympanitic distension of the abdomen, due to obstinate constipation, and which only yielded on the sixth day. The sutures were removed on the seventh day, but at once replaced by threads fixed with collodion to the abdominal parieties. The pulse was 95 on the first day, 82 on the second, 86 on the third, and 128 on the fourth. After the eighth day it did not again exceed 95, and on the nineteenth day it was 82. At that time the patient walked about, had excellent appetite, and gained flesh rapidly. By June 25, she was completely cured.—'Medical Times and Gazette.'

CASE OF UNUNITED FRACTURE OF THE LOWER MAXILLA,

SUCCESSFULLY TREATED BY SILVER LIGATURES.

Mr. M. H., an Englishman by birth, a labouring man, of good constitution and temperate habits, admitted into the Pacific Clinical Infirmary, June 12, 1861, in consequence of an united fracture of the lower jaw of four months' standing. The case had been under the care of a skilful practitioner, and why a bony union did not take place it is impossible to say. The fragments would move beyond each other when a little force was used, but when left alone they assumed a natural position, the teeth on either side of the fracture suiting each other exactly.

Operation.—An incision was made in the centre of the lower lip, dividing the soft parts to a little below the lower margin of the jaw. The bony structure in the region of the fracture was laid bare with the bone chisel, by peeling off the soft parts, in accordance with my usual plan in operations where the bones have to be exposed. This is effected in the following manner: the edge of the chisel is pushed along from the place of incision close to the bone, separating the soft parts from it, care being taken not to let the instrument slip into the surrounding tissues, by which some blood-vessel or nerve of importance might be wounded. I would recommend this method of exposing the bone as being altogether superior to that ordinarily pursued. By it there is little difficulty in separating the soft tissues from the bone at whatever point is is attempted. Even the breaking up of attachments between the adductor magnus and os femoris, at the point where the femoral artery perforates its tendon within six lines of the bone, can be readily effected.

The fragments of the ununited fracture being exposed where they come together, a careful examination was made to see if any evidence of disease of bone existed, but none being found, the adventitious soft tissues connecting the two extremities of bone were removed, so that two bony surfaces might come together, for the purpose of producing ossific union. The extremities were then drilled in two places, and silver ligatures introduced, the ends of which were tightly twisted together over the fracture so as to form firm knots. The drill was one line in diameter, and the ligatures as large as could conveniently be introduced. The ligatures were placed, one at the upper, and one at the lower margins of the jaw. The ends of the ligatures were cut off near the bone, with the view of permitting them to remain permanently. The dressing, however, was so arranged that they could be cut and removed, should it become necessary—the periosteum being removed from a small space, either because it was diseased and slipped off readily, or because I pressed it too hard with the chisel. The portion of the bone thus exposed was left uncovered by the tissues for the permitting any portion of bone that might exfoliate to pass off. The wound was dressed in the following manner: A piece of lint was placed in the bottom of the wound longitudinally with the incision, one end as high as the teeth, and the other permitted to hang out of the wound below. Two stitches were then taken to bring the margins of the wound together over the lint. Adhesive plaster was applied. The lint was wet in an evaporating lotion, composed of one part of alcohol and ten of water.

June 21st.—The patient is very well; has suffered no constitutional irritation, and very little pain, sleeps and eats well, can move the jaw regularly, and with a freedom that could not be permitted patients with fractured jaw, in whom the silver wire had not been used.

July 5th.—Saw the wound to-day, with bandaging all off. The jaw is firm, the contour of the teeth almost perfect. The patient can open the mouth with great freedom. The front part of the wound healed by first intention, but a bit of lint was still retained in the lower portion of the wound communicating with the bone. Two or three little abscesses were formed along the lower margin of the jaw near the angle.

October 9th.—The patient at his home in the country was attended by a Medical friend of mine, who removed the ligatures, and informs me that the cure is perfect. Small pieces of bone exfoliated and were thrown off about the time the ligatures were removed, after which the wound healed slowly by granulation.—Dr. E. S. Cooper, in 'Phil. Med. and Surg. Rept.

A POMMADE TO PREVENT THE FALL OF THE HAIR.

Dr. Dauvergne says: The beneficial effects of resinous and balsamic preparations in the diseases of the hair and the hairy scalp have long been known; and recent researches in the clinical wards of the Hôpital St. Louis, in Paris, have confirmed the empirical recommendations of these agents. Dr. Dauvergne has therefore often recommended ladies who were losing their hair to use tar-ointment, by means of which he has seen the hair in many cases resuming its strength after it has been affected with pityriasis, porrigo, favus, &c. But the disagreeable and penetrating smell of the tar was almost an invincible obstacle to its use; and Dr. Dauvernge has therefore endeavoured to conceal its odour by mixing it with perfumes of various kinds. He considers tar preferable in many cases to cantharides, inasmuch as the latter agent is inapplicable to the diseases of the hairy scalp, or of the hair-bulbs, or the hairs themselves. The pommade proposed by Dr. Dauvergne consists of tar, benzoin, musk, essence of patchouli, lard, &c.; and although in large quantities it retains a little smell of tar, yet when used for the hair, the perfume of the patchouli and the musk predominates. The exact proportions are the following:—Lard, 30 grammes (a gramme is 15·434 grains); Norwegian tar, 3 grammes; butter of nutmegs, 2 grammes; benzoin, 2 grammes; Fioraventi balm, 3 grammes; baume de commandeur, 3 grammes; musk, 5 centigrammes (a centigramme is ·1543 of a grain); and essence of patchouli, 50 centigrammes.—'Bulletin Général de Thérapeautique and Brit. and For. Med.-Chir. Rev.'

EFFECTS OF OPIUM AND SULPHATE OF QUINA.

Dr. Nivison, while admitting that the effects of opium and quina are in great measure antagonistic to each other, thinks that the most favourable therapeutical results are often obtained by their conjoined operation. Among other reasons in favour of the administration of these remedies in conjunction, Dr. Nivison adduces the following: The free use of opium often tends to reduce the biliary and renal secretions to a dangerous extent, but when combined with quina, this tendency is in a great measure counteracted. Opium also frequently reduces the respiratory action to such an extent that the blood may be only imperfectly aërated, but the contemporaneous use of quina counteracts this effect, while the desirable results of the opium are obtained. In many cases of extreme exhaustion, as from protracted hæmorrhages and the like causes, opium is employed as a stimulant, but it often produces unpleasant narcotism, an effect which may be avoided by the joint administration of quina. Again, quina is often given to relieve congestion by its power of causing contraction of the capillaries, but it sometimes only excites the general circulation; now the addition of opium controls this excitement, and ensures the legitimate operation of the quina. Neuralgia is palliated by opiates and sometimes cured by quina, but cases of this disease will often yield more speedily to the combined influence of opium and quina than to any other known remedies. Dr. Nivison also thinks that idiopathic fevers may be successfully treated by opium and quina in combination.—'American Journal of Medical Science.'

Ten Persons Poisoned.—Rugby, July 12th.—A most melancholy occurrence has taken place in a farm-house at Ashby St. Ledgers, a village on the borders of Northamptonshire, not far from this town. It appears that Mr. William Payne Cowley, a farmer, living in that village with his mother (who is a widow) and his brothers, had his sheep dipped, or washed, last week. The object of this dipping, or washing, is the extermination of vermin; and for this purpose a strong mixture of arsenic and soft soap diluted with water, is used. On Tuesday morning last Mr. W P. Cowley sent his brother, Mr. E. Cowley, to the adjoining town of Daventry, where he purchased 6 lbs. of white arsenic and a barrel of soft soap, weighing 30 lbs. On the following morning Mr. W. P. Cowley and his mother prepared the sheep-dipping mixture, in which some lambs were washed. In this operation Mr. Cowley and several of his labourers were employed. After assisting her son in the preparation of the soap and arsenic, Mrs. Cowley proceeded to make a batter pudding for the dinner of her family and the labourers and servants. By some means as yet unaccounted for it appears that some arsenic must have become mixed with the pudding, for the whole of the persons who partook of it—ten in number—became violently sick just after dinner, and exhibited all the symptoms of being poisoned. The best medical assistance in the neighbourhood was procured, but one man has already died, and another is not expected to survive; the others are all more or less affected. The name of the deceased is Richard Smith; he was an agricultural labourer and fifty-three years of age. The following is a list of the other persons who are ill:—Mr. Edwin Cowley, farmer; Mr. Perkin Cowley, farmer; William Montgomery, shepherd; John Cowley, labourer; Jane Cox, housemaid; Mary Ann Montgomery, servant, and three boys, named John Cox, Thomas Montgomery, and George Smith. Mr. W. Terry, the Coroner for the Central District of Northamptonshire, held an inquest on the body of the deceased, Richard Smith, at Ashby St. Ledgers, on Tuesday afternoon. Several witnesses having been examined, the inquiry was adjourned.—'Globe.'

The War in China.—Assistant-Surgeon A. Hogg, of H.M.'s ship 'Encounter,' was severely wounded at the capture of Ningpo, on May 10th. In the engagement, Dr. A. Irwin, of the same ship, was continually under fire whilst attending the wounded.

THE MEDICAL CIRCULAR.

WEDNESDAY, JULY 23, 1862.

INSTRUCTION IN PHARMACY.

Let us pursue the theme on which we discoursed last week. Notwithstanding that the Medical Council has been in existence four years, it has yet done nothing to ensure adequate instruction in pharmacy of the candidate for general practice. Apprenticeships have been virtually abolished, the Society of Apothecaries' is rapidly becoming obsolete as an examining body, the College of Physicians has assumed new functions in relation to general practitioners, new ordinances have been issued for the regulation of Medical education as regards classical literature and natural science, but nothing has been done, or proposed to be done, by the Medical Council, to secure a competent knowledge on the part of the general practitioner of one of his most necessary functions. The art of dispensing has been entirely overlooked, as too mean a subject to engage the deliberations of our august councillors. Yet how helpless is a Medical practitioner who does not understand this art. How often does the careful surgeon himself dispense a prescription to ascertain the effect of certain combinations, and to guard against sending to his patient a nauseous mess that would be sure to revolt his stomach! We remember a certain Hospital physician who was so anxious to know the result of his prescriptions, that he was a frequent attendant in the Dispensary, where he manipulated for himself, that he might get a knowledge of the most suitable combinations of the remedial agents he wished to employ. He was keenly alive to the importance of the art, and studied it as a part of his duties as a physician.

Yet this art is, we fear, dying out among us. We know it as an undeniable fact, that there are men on the Register who are ignorant of the qualities and doses of drugs, and of the proper method of compounding them. Human life is not safe in such hands. So appear to think the Council of the College of Surgeons, who have recently qualified the Regulations of the Medical Council, so as to enable the candidates for their diploma to acquire a knowledge of Pharmacy. In the present state of things there is an evil, the correction of which brooks no delay. Every man whom the College of Surgeons sends forth, and who obtains no other diploma, goes into practice with the suspicion of incompetency. A few years ago there was comparatively little danger in the single diploma of the College. All candidates passed through a regular apprenticeship, and whether they took one diploma or two, they were generally well instructed in the appearances and uses of drugs, and in the minor duties of dispensing. Now all this is altered. A solicitor may choose to make a son a surgeon, and without previous preparation send him at once to attend lectures and walk the hospitals, until, in due time, he shall have completed his course of study and shall go up for his examination. During the whole of this period he may not once have compounded a black draught; and should he present himself to the Examiners of the College, he will neither be asked to do it, nor to state if he knows how.

There is too much lecturing at our Medical schools. Lectures in the morning, lectures at noon, lectures in the evening, lectures in the summer, lectures in the winter, lectures on botany, lectures on chemistry, lectures on jurisprudence, lectures on moral philosophy, lectures on natural philosophy, and fancy lectures in short courses, lectures for pamphlets and lectures for books, in short, the perplexed student is belectured to satiety, and by the middle of the second session, he has made up his mind that the whole system is a mistake and a bore, and he skulks all the attendances he can excusably avoid. By the middle of the third, he is conscious of his momentous deficiencies, and, as he has no wish to be rejected at his examination, he wisely resorts to the aid of a "grinder" who—despised man! will graft ten times more useful knowledge into his head in three months than he was able to acquire by lectures in as many years.

Mr. Lawrence is right; these "long-winded lectures" are overdone. We have often laid our hand heavily upon Mr. Lawrence; and we know that his affection for the MEDICAL CIRCULAR is not particularly ardent; but we can do him justice; and we applaud the sensible and straightforward speech he delivered upon this subject at the Fellows' Dinner. These lectures may be good for the 'lecturers,' but they are bad for the pupils. Such is the experience of the oldest lecturer in London, a man whose experience in this matter we cannot dispute. This is the system to which the Medical Council has given its sanction, and, indeed, is using all its power and influence to confirm. The gentlemen are themselves the lecturers who find their profit in the system which Mr. Lawrence tells them is pernicious.

This is not the first time that we have called attention to the evils of the present method of instruction; and we are quite aware that attempts have been made to correct them by introducing the tutorial system into our schools. These attempts, however, have not much ameliorated the grievance, if, indeed they have not added to the burden which the students are compelled to bear. Nothing less than a thorough revision of the system will suffice.

According to the present practice, a lecturer on Materia Medica, for example, will divide an ordinary book into sections, and retail the whole of it in the form of lectures in the course of one session. Why not let the student buy the book and read it at home? Then examine him for an hour once or twice a week to ascertain the extent of his knowledge, and make his certificate dependent upon his acquirements. What a farce it is for a professor to lecture a student in the morning out of "Fownes", and send him home to read the same book in the evening!

We commend the subject of this article to the Medical Council. They have been making regulations hitherto for the benefit of lecturers; now let them legislate a little for the benefit of students.

SUMMARY OF THE WEEK.

RETIREMENT OF DR. BUDD FROM KING'S COLLEGE HOSPITAL.

Yet in the prime of life, Dr. Budd has deemed it right to resign his post at King's College Hospital. Had this retirement been a solitary one, we might have supposed that an increased pressure of professional engagements had induced Dr. Budd thus prematurely to determine his hospital career; but looking at it in connection with the withdrawal of Mr. Bowman, Mr. Lee, Dr. Murchison, and others, we cannot help suspecting that some concealed motive has influenced those gentlemen in the resolution they have taken. So long as Mr. Fergusson holds up the standard of scientific surgery in that School, its great reputation will be maintained; and, however much we may regret the removal of such eminent teachers as Dr. Budd and Mr. Bowman, yet we do not fear that in due season men of equal mark will rise to fill their places.

THE VENTILATION OF SHIPS.

It is generally admitted that the undue mortality among seamen is owing mainly to the insufficient ventilation of ships. Sometimes decaying materials have been found between the inner and outer skin of the ship, and sometimes in the lower part of the hold; but, generally speaking, if ample ventilation could be secured, these incidental nuisances would not be so productive of disease as they confessedly are. If the evil was great in the old timber ships, it promises to be much worse in the new iron ships now building. In consequence of the diminished depth of those vessels, the occupation of their space by machinery, and the small number of portholes, as well as the apertures by which air might be admitted into the interior, much apprehension is felt lest these iron ships should turn out to be mere floating hospitals. Let those gentlemen who take an interest in the health of seamen, apply their minds to this subject, and bring it at once under the notice of the Admiralty, who now seem to be devising only the best method of constructing an iron-coated ship that she may carry the heaviest possible battery. They need not think less of the guns, but they should think more of the men who work them; for, after all, success in war will depend more upon the number and healthy vigour of the crew than upon so much gun-metal.

IDIOCY AFTER DIFFICULT PARTURITION.

In the last number of our journal we quoted a startling statement from a paper contributed to the 'Medical Times and Gazette,' by Dr. Mitchell, to the effect that difficult parturition involving protracted delivery, the use of the forceps or other instrumental aid, induced idiocy. This, of course, is a most important question, as if the statistics upon which Dr. Mitchell's statements are based be correct, they would lead us to a reconsideration of some, at any rate, of our operative procedures. Dr. Ramsbotham has, however, this week replied to Dr. Mitchell in the same journal. He asserts that he has delivered 408 children by the forceps in cases of protracted delivery, and he is not aware of a single instance in which idiocy was the result. What is the experience of other accoucheurs? What proportion does idiocy bear to difficult deliveries? Rather an abstruse question to elucidate.

THE LUNACY REGULATION BILL.

The House of Commons have bettered the wisdom of the House of Lords, and have rescinded the clause in Lord Westbury's Bill that disallowed the *opinion* of a medical man as evidence of insanity. The House of Commons seems to think that it is but fair that an alleged lunatic should have every chance given to him of establishing his sanity, and are obviously more afraid of the narrowness of the lawyers than they are of the speculativeness of the alienists. So let it be.

THE LATE MR. PUCKETT.

We adverted last week to a proposal from Mr. Griffin to raise a fund in behalf of the surviving family of the late Mr. Puckett. We now earnestly recommend this case to the generosity of our readers. It is one of the most afflicting that has ever come under our notice, and appeals powerfully to the sympathy of every Medical practitioner. Mr. Puckett had but a limited practice and narrow means; indeed, how he managed to struggle along with his small income is a marvel; he has, therefore, left nothing for the support of his widow and those dependent upon her. This is really a case deserving of charitable help.

THE COLLEGE OF SURGEONS AND BRITISH MEDICAL ASSOCIATION.

The British Medical Association holds its annual meeting this year in London. There will be a *conversazione* on the 5th of August at the College of Surgeons; and the Council wishes it to be understood that the attendance at their own College of every Member would be welcome on that occasion. There will be no special invitation issued, as the Council conceives it to be unnecessary. Our readers will, therefore, take this announcement as sufficient. This step on the part of the Council is a most proper one; as the College is the College of all the Members, not of a section.

REVIEW OF BOOKS.

The Half-Yearly Abstract of the Medical Sciences. Edited by W. H. Ranking, M.D., and C. B. Radcliffe, M.D.

It must be a difficult thing for the Editors of this volume to make a satisfactory selection of the interesting matter contained in the numerous periodicals now published; nevertheless, they have succeeded. There is scarcely any topic of importance that has been reported or discussed in the journals, or that has been alluded to in the standard works that have been published during the past six months, that is not included in this volume, which thus affords a compendious view of the literature and science of the day. Whilst this work continues to be so well got up, it will retain its merited popularity.

Infanticide: its Law, Prevalence, Prevention, and History. By Wm. Burke Ryan, M.D. London.

The subjected selected by Dr. Ryan for this *brochure* is one of the most important questions that can engage the attention of the philanthropist. Unfortunately it is so inextricably associated with a cardinal vice of society, that there is a reluctance to give proper consideration to the means for its correction. Very recently we adverted to the large sacrifice of infant life in this metropolis, as declared by the Reports of the Registrar-General; but we have no doubt that this crime is more extensively committed than the public reports show. Dr. Ryan has for some years given his especial attention to the subject, and in the year 1856 won the Fothergillian gold medal for an essay upon it; he is, therefore, well qualified to enlighten public opinion in relation to this prevalent crime. Dr. Ryan says with respect to the prevention of infanticide,—

"After much study of the matter, and comparing the opinions and statistics of many different authorities, I am inclined to think that foundling hospitals conduce much to the prevention of the crime of infanticide. I think that the great weight of opinion tends to this view. Whether they are adapted to the 'genius' and habits of this country is a point which need not at present be discussed. The great objections that they may be abused, as when married parents, too lazy to support their children, wish to desert them; or that they lead to immorality as to sexual intercourse; or finally that the mortality is undeniably great—I consider light in the scale—if they only put a stop to the more monstrous vice,—the more crying evil. I can well imagine, although I am far from admitting, that greater laxity of morals as to this intercourse may lead to more illegitimate births in countries where they exist; but I cannot believe that infanticides are likely to occur in equal numbers where hospitals are supported as in those countries where they do not exist. Such a conclusion would argue too strongly for the depravity of human nature, and a person may well be excused in not arriving at it. These institutions were doubtless established to prevent exposures and infanticides, and in common with all other institutions for the amelioration of human misery were from time to time fearfully abused, and this to such an extent as to demand their suppression; but this was followed by such an increase of exposures and infanticides that recourse was again obliged to be had to them. This was especially the case in France in the reign of Louis XIII. In speaking of them as giving rise to immorality, is it not possible that we are taking the effect for the cause, and that we are excluding climate, which notoriously influences the passions, in making up the account? Many of the abuses of such could be remedied by a proper amount of supervision—indeed, such have been remedied where a strict system of registration has been adopted. Touching infanticides, Dr. Webster, whose statistical inquiries are entitled to great weight, mentions the extraordinary circumstance, that when he recently visited Sweden, he found of 1,183 persons, lately undergoing punishment in the prisons, 106 were committed for infanticide, and twenty-six for procuring abortion, being one-ninth of the inmates of these establishments! I am not aware that such things have been shown to exist where foundling hospitals are established. He also mentions the large

proportion of illegitimate children born in Stockholm; one-third of the whole births being bastards! By a recent return in his possession, out of 4,614 births registered in Stockholm during one year, 1,424 were illegitimate, nearly 31 per cent.! This strongly shows the connection between illegitimacy and infanticide."

The first proposition for the establishment of Foundling Hospitals was made in the MEDICAL CIRCULAR a few years since, when calling attention to the frightful evils of the present indifference to the habits and temptations of the lost classes of women. There is more laudation than is decent of the public press and of particular journals in this work. Nevertheless, it gives a thorough analysis of the subject both in relation to facts and opinions, and we hope that it will have a beneficial influence in directing public opinion towards the adoption of some efficient means of redressing the evil.

REVIEW OF THE PERIODICALS.

The 'British Medical Journal' (July 5) contains a continuation of Dr. LATHAM'S remarks on *Pain*. He contrasts the operation and effects of anæsthetics and anodynes—chloroform and opium—and observes that chloroform acts on the system like a *fit*. He says:

"And thus chloroform does not produce its vast impression otherwise than *fitfully*, and the impression itself may be said to consist of fits of coma or fits of trance. From its own nature, the coma or the trance is ready to pass away every few minutes; but chloroform applied every few minutes succeeds again and again in keeping and retaining it, or bringing it back. And numerous fits procured in this manner serve to give an apparent length and continuity to the impression. But let the impression hold on spontaneously, let it sustain and prolong itself independently, and so lose the fitful character, then peril is nigh at hand.

"This sensorial impression, produced by chloroform, which looks so formidable has in its *fitful* character the great condition of its safety; and its subsidence, or inclination to subside, again and again, after being again and again renewed by fresh applications of chloroform for one or even two hours, is still a condition of its safety.

"Doubtless, you can produce as great an impression upon the sensorium by opium, if you only give enough of it, as you can by chloroform; but not an impression as great in degree, and, at the same time, as short in duration. You cannot play upon the sensorium with opium as you can with chloroform. You cannot urge or take off the pressure of your opium, and so raise, or lower, or stop its effect, once produced. Opium, once given, is gone beyond your power to recall. It must be then left to work according to its nature; and its nature is to exercise its impression, not *fitfully*, but continuously.

"Now, *inflicted* pain is, beyond all experience and conception of pains, the most severe. No pain can come near the pain of the knife. To counteract it, to stop its cry, requires an insensibility which shall equal the insensibility of death. But the world has grown old before the medicine has been found which can procure the insensibility of death, yet not procure death itself. But this is found at last, and that medicine is chloroform: and thus chloroform is peculiarly the remedy of inflicted pain.

"Further, *inflicted* pain is as short or as long as, guided by the present necessity, we choose to make it. Generally it is short; or if it be long, it is rather several successive inflictions than one continuous pain. In the meantime, we want to have that deadly insensibility, which is counteractive of it, as much at our command as the injury which we inflict is at our command—to make the insensibility short, when we make the injury short, and long when we make the injury long. Chloroform is the medicine which can both procure the insensibility, and can put it thus wonderfully at our command. In this respect, also, chloroform is peculiarly the remedy for inflicted pain.

"But opium is no remedy for *inflicted* pain. The conditions of its operation forbid it. Its operation, whether great or small, is always continuous. It can produce the insensibility of death, but not without producing death itself."

There is also a report in the same number of Dr. ACLAND'S interesting address on the occasion of distributing the prizes at St. Mary's Hospital. We make a few quotations:

"At the close of his preface to the *Methodus Studii Medici*, Albert Haller gives us the apparently obvious advice that, whoever wishes to learn the science of medicine, should follow a good plan, read good authors, do nothing but what bears on medical science, and omit nothing that is necessary for its acquisition. How this is to be done he proceeds to show. But remarkable as is his book, his own preparation for the work is more remarkable still. He tells us that he had himself read, and made notes upon certainly more than six thousand volumes, besides journals, and other works not included in the calculation. Haller was not a book-worm. That at least was not his vocation.

"His character was essentially that of a student of nature. He used books because he respected other men as he did himself. Reading books, he says, has the same advantage as foreign travel. By seeing and hearing divers opinions of human affairs, we are drawn from the narrow sphere in which our education has restrained us. We cannot, indeed, he argues truly enough, dispense with the written labours of other men. 'Quæ solertia sufficerit exæquandis difficillimarum regionum animati corporis historiis, quales felicibus naturæ cultoribus debemus, quorum nomina continuo exprimentur. Velisne carere SWAMMERDAMIANIS, supra humanam patientiam subtilibus, experimentis, sperasne te ounden, et insecta incisurum, ut SWAMMERDAMIUS, et nervos ut MEKELIUS, et musculos ut ALBINUS?' (Haller, *Elementa Physiologæ*, tom. i., p. 8.)

"This extraordinary man so prepared himself, dissecting in human and comparative anatomy, making and re-making experiments, verifying the statements of authors to test their accuracy, and writing (I have not seen them all) in fifty years two hundred treatises, of which one is of nine volumes in quarto, and another, that for which he had read his six thousand volumes, was condensed into two not large quartos. I will not even mention his most varied general attainments, or hint here at his ordinary literary labour, on subjects remotely connected with medicine.

"It is well to contrast at once with this work the different yet parallel labour of a name so known in London, that the mention of it may seem to some of my colleagues superfluous. For the sake of the less instructed, they will let me explain the nature of John Hunter's work—his objects—and the way he set about to accomplish his purpose: Haller showed what literary work could do in medicine. 'What did John Hunter effect?'

"John Hunter was essentially a surgeon; to the improvement as well as exercise of the art which he practised till his death, he devoted himself. While young, he had numerous opportunities of seeing gunshot wounds. He then considered attentively the processes by which injuries are repaired; he concluded that for the right understanding of the smallest actions in a living body, the nature of that body, and the laws, as far as they can be learned, of life itself must be unravelled. To know the mechanism by which the simplest boil is formed and cured, the principles of action in living things must be learnt to the uttermost. It is quite unnecessary to consider whether all John Hunter's conclusions concerning life and vital actions are absolutely correct; this is not now to the point; we have to ask how this eminent student applied himself to learn his art. To understand disease he must understand that from which it is a departure, health. To understand the balance of organs, in the perfection of which health consists, the organs must be studied. If the organs are too complicated for investigation, as one might expect to find, and is in fact the case, they must be looked for in some simple shape. Where there is life in a simpler form, there may be seen, perhaps, the clue to some law unintelligible in the more complex structure. All life, vegetable and animal, is to be questioned. Every structure and every operation of every mechanism has to be first separately examined, and then they must be compared with each other. And further, the same structure may by different relations to other parts, have new significance. All these inter-dependencies are to be studied. Hunter did all this, and more—he instituted experiments on living beings of very various kinds to determine the laws of growth and repair—and examined with the most particular care the mode of formation of the young in every accessible class. Nor was this done cursorily. The dissections were so carefully made as to be fit for permanent preservation, and remain a precious national treasure to this day.

"I can scarcely venture now to go through even an enumeration of his work, though I must add that not content with this survey of the existing tribes of living things, he compared with them the relics of the past, amassing from all quarters the remains of the ancient world.

"It is sufficient, perhaps, to the present purpose to say that, though Hunter was convinced that life is something essential in itself, he ransacked every living thing to detect the material laws by which it operates; and though he was most minutely observant as a clinical student, he sought the ground of his pathological conclusions not in disease alone, but in the whole history of the human organism in all its relations, and from its first formation to its maturity and decay.

"It is doubtful whether Hunter paid much attention to the common physical properties of substances out of which organised bodies are made. Indeed it was probably then unnecessary. Already another person had drawn the attention of the learned world to the importance of physics as the foundation of physiological research. Boerhaave, the teacher of Haller, though eminently a practical physician, had perceived that as organic bodies are formed of inorganic substances, (*ex necessitate rei*) therefore that, whatever may be the properties of the organised substances, the mere physical properties of their inorganised constituents should be known and appreciated as thoroughly as is possible. This instance

of laborious honesty in the practical physician, is the third lesson which I venture to suggest to the student. Boerhaave was, I said, essentially a physician, and a practical physician of the most consummate order, skilled in all the learning of a learned age. Altogether eclectic, a metaphysician, and physiologist, he conceived, and properly, that in the care of beings to whose life and to whose mind a material body is essential, the physical laws of all the original components of the body should, if possible, be known. It is interesting, therefore, to see that the beginning of his treatise on the study of medicine (written in Latin, as was and is the custom at Leyden) is on geometry, and the importance of precise ideas and definitions in physic. How much our views are tending again in he same direction I need not now stop to say; but the result was that he was reproached for being too mechanical in his views of *life*, and for neglecting to attribute a proper share to the actions properly called *vital*. The charge was unjust and unfounded, and, as though to leave behind him the strongest refutation, he breaks out in the midst of a noble academic oration, calling on all "physici, mechanici, hydrostatici, hydraulici, anatomici, chemici, to make a single drop of that dew, by which moisture is given to the eye.

"'En panem, en vinum,' he goes on to say, 'let them all come and make a single drop of blood. In vain they will meet. While the very food, without chance of failure, shall in every part of the meanest frame make its proper texture.'"

Then follow some discriminative remarks on the character and labours of the late Dr. Alison. Speaking of his zealous efforts to establish a Poor-Law in Scotland, Dr. Acland says:—

"If you ask, were these all the secret springs that moved him?—I would answer that, in truth, all interests were his. On his journeys, as they who knew him well know, not a spot did he pass that Scott or some older bard had chronicled, but his gentle voice would murmur hero and there the verse that told it; not a military road or an ancient work or way but that he knew it all; not a bird that warbled as he went but he knew its song, and he seemed as though he was its friend. Alison was a man. And anything else? He was reserved almost to a fault; and, as great men are, in all that concerned himself, reticent to a degree; but happily once, in his controversial writings, his inner soul bursts forth. He writes:—

"'There are many persons who consider this question as merely one of pounds, shillings, and pence. . . . . But, at present, I do not address myself to such men. . . . . I address myself to those who have been accustomed to look upon the poor, not as objects of disgust or aversion, but as brothers and sisters in affliction, who are born to the same hopes as themselves, look up to the same Father in heaven, and trust to the Mediation of the same Redeemer; to those who remember that charity is the highest of Christian duties, and that 'our Saviour himself chose to be a beggar, that we, for his sake, might not despise the poor.'—'Observations on the Management of the Poor in Scotland,' 1840, p. 36.)

"This said, he returns to his controversy and his arguments; and in the end his arguments prevailed."

The 'American Medical Times,' May 24, contains an able article by Dr. Fordyce Barker, on *Laceration and Rupture of the Perineum*. Dr. Barker especially alludes to the great hæmorrhage that occasionally occurs in these cases, a circumstance not ordinarily noticed, and when the hæmorrhage is observed it is usually supposed to come from the uterus. We have, ourselves, seen hæmorrhage from this source on two or three occasions, so severe as to endanger life, and can fully confirm Dr. Barker's clinical observations. We quote a case, and remarks thereon:

"Primipara, aged twenty-six. The labour presented nothing unusual, the child a female, weighing 8¾ lbs., being born in about eight hours after labour commenced. The vertex presented in the right occipito-posterior position, and the occiput, instead of rotating under the pubes, passed into the hollow of the sacrum. The labour, however, progressed favourably, and the head soon appeared at the vulva. The perineum was then carefully supported, and as soon as the head was born pressure was made on the uterus, and kept up during the delivery of the body of the child and afterwards, to secure permanent contraction of the uterus. The cord having been tied and cut, the child removed, the perineum was examined, and found to be lacerated to the extent of about an inch. It was noticed that there was some hæmorrhage, but it was thought that it would cease on the removal of the placenta. This was easily accomplished in a few minutes, but as the bleeding continued, particular attention was given to the uterus, upon which steady firm pressure had been kept up from the time of the delivery of the child's head, which was found to be firmly contracted. Remembering then a case which I had seen some weeks before, in which, after delivery by the forceps in the hands of Dr. Barking, the perineum being somewhat lacerated, severe hæmorrhage occurred, although the uterus was firmly contracted, and it was found that the bleeding was from lacerated vessels in the perineum, I concluded that the present case was a similar one. I therefore at once endeavoured to arrest the hæmorrhage by sponging away the bloods and clots, so as to discover the source of the bleeding, which I should have stated did not come on in a profuse and general flow, as if it were from several points at once, but in a steady, continuous jet, about as large as a small quill. I then passed two fingers into the vagina, and, with the thumb externally, I firmly compressed the lacerated edges of the perineum. This attempt was not at first successful in arresting the hæmorrhage, but after changing the position of my fingers several times I succeeded in arresting any further flow, and when, after an hour and a quarter's continuous pressure, I gradually withdrew my hand from the vagina, it was not followed by any bleeding. Firm pressure was kept up by my assistants upon the uterus during the whole time, but it showed no disposition to relax. The patient's knees were then tied together, a full opiate was given, and she was directed to remain perfectly quiet, and a nurse was left by her side to enforce my directions, and to send at once for aid should the hæmorrhage recur. It did not, however, and the patient made a very good recovery, adhesion kindly taking place. The amount of blood lost was estimated at rather over a quart."

Dr. Barker gives an excellent analysis of the various conditions and contingencies that may induce laceration of the perineum. We extract a portion of his remarks upon this subject:—

"1. Certain anatomical conformations of the maternal organisation are peculiarly liable to this accident, as (*a.*) a very straight sacrum. Now and then you will meet with a woman in whom the sacrum has little if any more curvature than is ordinarily found in the sacrum of the male. This is the case with the woman whom I have shown you in the wards, with complete procidentia uteri. The perineum was lacerated in a labour some years ago, and the posterior border of the vulval opening is not three lines from the anus, and on examination we found that the sacrum was remarkably straight. In such a pelvis the axis of the outlet must form an angle with the axis of the pelvic cavity, and the effect of the uterine contractions is to drive the head directly down upon the perineum in a line nearly parallel with the axis of the superior strait. (*b.*) The direction of the vulval opening differs very greatly in different women, I am not aware that any author has alluded to this, but your own future experience will surely verify the truth of the assertion. In some the ostium vaginæ is nearly parallel with the plane of the trunk, while in others it is nearly at right angles with this plane or to put the statement in other words, in some the direction of the vaginal canal is nearly parallel with the axis of the pelvic cavity, while in others it more nearly corresponds with the axis of the outlet. This difference does not depend entirely, as you may at first suppose, upon the length of the perineum, nor upon the straightness or curvature of the sacrum, but a careful study of the subject has led me to the belief that it is due more to the conformation of the soft structures within the pelvic cavity. You can readily understand how much more liable rupture or laceration of the perineum is to occur, where one condition exists, than where the other does. You can also see the bearing of this anatomical fact, if you admit that it is an anatomical fact, upon the necessity in some cases, and the proper mode in different cases, of supporting the perineum. (*c.*) There is a great difference in women as to the elasticity and distensibility of the perineum, depending upon the amount of adipose tissue in its structure. Where this is very considerable there is sure to be an unyielding perineum. (*d.*) Laceration is liable to occur where there is extreme smallness of the vulva. According to Velpeau, its mean size from the clitoris to the posterior commissure of the vulva is one inch and a half. In some cases, exceptional ones to be sure, that I have had, I am sure that the measurement between these two points could not have exceeded three-fourths of an inch. There is a prevalent notion, even among medical men, that the size of the vulva corresponds with the size of the mouth, but I am convinced that the opinion has no foundation in fact.

"2. The perineum is liable to laceration from the excessive size of the head or the shoulders of the fœtus. This excess may be either absolute, as in one case that several of you saw me deliver by forceps in this hospital, where the occipito-mental diameter of the fœtal head was six and five-eighths inches, one and one-eighth of an inch beyond the ordinary normal measurement. In another case, where there was no excess in the size of the head, I found great difficulty in delivering the shoulders, and on measurement the bis-acromial diameter proved to be six inches and three-quarters. The excess may only be relative as compared with the size of the vulva.

"3. Laceration of the perineum is often liable to occur from certain peculiarities in the mechanism of labour, as (*a*) in vertex presentations where the occiput rotates backwards into the hollow of the sacrum, because here an occipita-frontal diameter must first pass out of the vulva, which is three-fourths of an inch greater than the sub-occipito-bregmatic diameter, which ordinarily first

passes out in occipito-anterior deliveries. (*b*) In face presentations, because during the delivery the vulval orifice must be distended to the length of the longest diameter of the fœtal head, that is, the occipito-mental diameter, which is ordinarily five and one-quarter inches, must pass through. (*c*) Incomplete flexion, when the head, in vertex presentations, presses upon the perineum, also may be a cause of great danger of this accident, as in this case the occiput does not fully engage under the arch of the pubes and thus the occipito-frontal, instead of the sub-occipito-bregmatic diameter, will first be driven through the vulval orifice. (*d*) On the other hand, excessive flexion may also tend to this result, as the direction of the expulsive force of the uterus falling nearer the occipital half of the occipito-frontal diameter, will be an obstacle to the extension of the head, which takes place in its normal exit through the vulva.

"4. The physiological character of the labour is an important element as regards the danger of this accident. (*a*) Where the labour is too rapid, from the intensity and frequency of the uterine contractions, and especially if the sacrum is somewhat less curved than is usual, the head may be driven through the vulva before the perineum has had time to be gradually extended ; (*b*) or where the labour is very tedious, and the head remains a long time at the lower strait, until the perineum becomes hot, dry, congested, and unyielding, if a rapid delivery is effected either by means of ergot or the unskilful use of the forceps, the sudden expansion of this tissue is very apt to involve a more or less extensive laceration. (*c*) Excessive nervous irritability, causing the patient to make most violent straining efforts to force the head through the vulva before the perineum is prepared for it by a gradual expansion."

Dr. Barker enjoins a proper support being given to the perineum, and thinks that laceration is often caused by the want of it. On this point we would only observe that almost every practitioner does support the perineum, and yet lacerations occur; but then each does it in a different way, some with two fingers to the fourchette, some with the bare palm, some with a napkin, some one way and some another. Which is the proper way? Dr. Graily Hewitt does not approve of supporting the perineum, but Dr. Barker considers this opinion an "error which is becoming rather fashionable."

The 'American Medical Monthly.' Dr. T. Gaillard Thomas contributes to this Journal an article on *Paraplegia*. Dr. Thomas prefers the term "functional paraplegia" for those forms of paraplegia not attended with organic changes, to the term "reflex paraplegia," introduced by Dr. Brown-Séquard. He gives the following table of symptoms diagnostic between organic and functional paraplegia :

Organic Paraplegia.	*Functional Paraplegia.*
1. Comes on suddenly, and is more or less complete.	1. Comes on gradually, and is always partial.
2. There is pain in back, extending down the legs and around the body.	2. No fixed pain in back or legs, and no "band" around body.
3. Passing ice or hot water down spine gives great pain.	3. None is experienced.
4. Jerking or spasm of muscles of legs exists.	4. None.
5. Bladder and rectum are affected.	5. Not so.
6. Prickling and formication occur.	6. None.
7. As time passes the paralysis becomes worse.	7. As time passes it diminishes.
8. There is great tendency to bed-sores.	8. None whatever.
9. Extremities are colder than normal.	9. Temperature normal.
10. Sensibility impaired.	10. Not so to any great degree.
11. Muscular enfeeblement is strictly confined to the lower limbs.	11. There is often a tendency to enfeeblement of upper limbs.

"In speaking of the treatment of organic paraplegia, I told you that the indication is to disgorge as much as possible the vessels of the cord, and produce a sedative, quieting effect upon it. In the functional variety the reverse is true ; we should endeavour to stimulate the functions and circulation of the cord.

"To this end, no drug compares for an instant in value with strychnia, and I shall prescribe that here, to be given until a decided constitutional effect is produced. At the same time I shall direct the use of cold shower baths along the spine, and the frequent application of electricity. The patient must be encouraged to exercise the muscles systematically and steadily, and she will receive the best diet which the institution affords. My experience with these cases leads me to hope and believe that under this course she will rapidly recover."

Several interesting cases of functional paraplegia are recited. We extract the following :

"*Case* 4.—Mary Lewis, born in Ohio, æt. twenty-three years, married, admitted to the hospital on the 14th of April. The patient enjoyed perfectly good health until about six weeks ago, when she was attacked by acute dysentery, which was accompanied by constant nausea and vomiting. After this had lasted for a week, she noticed a prickling sensation in the legs, and found herself growing gradually feeble in these members. In about three weeks from this time she became almost entirely paraplegic, so as not to be able to walk without great assistance ; as I now direct her to stand, you observe that she sways to and fro, and every now and then seems about to fall, which she would do, if not prevented by firm support. Her left arm has likewise become somewhat, though not a great deal, enfeebled. Besides the symptoms mentioned, she has none pointing towards the spinal cord ; there is no trouble about the bladder or rectum, and only for a week has pain in the back been complained of. The dysentery still continues, although not with its former violence.

"This case I regard, gentlemen, as a good type of the reflex paralysis of Sequard. What the absolute connection is between the ulcerations in the large intestine (or, at least, the inflammation there), and the enfeeblement of the muscular system, I am not prepared to say, for I am free to confess a great degree of scepticism as to the hypotheses of Brown-Sequard on the subject ; still, in the present state of pathology, I know of no better way of dealing with this case of functional paraplegia than by classing it with the reflex variety of that eminent investigator.

"The treatment which I shall adopt in this case will be entirely directed to the dysenteric trouble. If, as I suppose, the other is secondary to this, it may pass off without treatment ; should it not do so, it shall engage our attention at a future period.

"May 14th.—I show you again the patient Mary Lewis. She has now entirely recovered from the dysentery, and the paraplegia has so far passed off that she can stand and walk across the floor without assistance. When in the presence of Drs. Flint and Clark, she was this morning demonstrating her ability to walk, I requested her to shut her eyes, and she suddenly and violently fell to the floor. She can stand without difficulty with her eyes open, but the instant that she shuts them she falls as if shot through the head. This curious pathological phenomenon I have noticed in a number of cases of functional paraplegia ; so commonly, indeed, that I am now inquiring, by clinical investigation, whether it be not diagnostic of this variety, at least to a limited degree.

"Some time ago, a male patient suffering from phthisis and empyema in this hospital, was affected by paraplegia, which was regarded by the physicians of the service in which he was as organic. One day Dr. Echeverria, in going through the wards, directed him to stand erect (which he could readily do) and close his eyes, when instantly he fell to the floor, as you have seen Mary Lewis do. This being repeated, the same result instantly took place.

"The patient died, and a careful autopsy revealed the cord in a perfectly healthy condition ; the case having been one, I think, of functional paralysis, perhaps dependent upon irritation reflected from the diseased pulmonary or pleural surfaces ; in other words, a case of reflex paraplegia."

Dr. Loomis, of the Bellevue Hospital, has also contributed a practical paper on *Affections of the Lymphatic Ganglia attendant upon Soft Chancres*. He observes :

"There are two recognised affections of the lymphatic ganglia attending upon soft chancres. These depend upon distinct causes, and in the phenomena which attend their development and their termination there is a marked difference. One is a simple inflammation of a lymphatic gland, produced by irritation ; the other is the result of the direct absorption of pus from the surface of the chancre, which is arrested in its progress by the ganglion nearest the seat of the chancre.

"The ganglia involved in either case are always the superficial Symptomatic or non-specific adenitis may be developed at any time during the progress of a soft chancre, but usually its appearance is immediately preceded by the chancre's taking on an inflammatory character. It may terminate in resolution, or it may suppurate, and its diagnostic characteristics are—that it is slow in its development, and unattended with pain ; the gland enlarges, but presents little disposition to suppurate ; it is soft ; the integument over it is freely moveable ; if suppuration occurs, it is indolent in its character, and the pus furnished will not produce a chancre by inoculation—in a word, in its main features, it closely resembles ordinary strumous adenitis.

"Specific or virulent adenitis depends upon the presence of virulent pus in the meshes of the ganglia; in fact, it is a chancre of the gland, and on account of the presence of the chancrous virus,

suppuration and entire destruction of the gland is inevitable. As a rule, but a single gland is involved and the prominent facts in regard to this form of adenitis are, that the gland enlarges rapidly, is painful and tender from the commencement; its progress is rapid, involving the tissues around the gland; it suppurates and opens spontaneously, early furnishing inoculable pus, and is liable to all the accidents to which a soft chancre is subject. I have thus briefly noticed the main features of these two varieties of adenitis, in order that I might the more clearly speak of their treatment."

With regard to treatment, Dr. Loomis remarks:

"In the management of non-virulent adenitis, the most important point is to prevent suppuration. This may be accomplished in the majority of instances by compression; if tenderness of the glands prevent the immediate application of the compress, apply the saturated tinct. of aconite for a few hours; then apply firmly by means of a spica bandage, a hard pad of sufficient size and shape to press evenly over the whole of the gland involved. Enjoin absolute rest and a non-stimulating diet. Subdue the inflammatory condition of the chancre (which is usually present) by opiate lotions, and at the end of a week, usually, the adenitis will be arrested.

"If suppuration has already occurred, open the abscess by a crucial incision at its lower border; fill the cavity with lint, over which apply compressed sponge by means of a spica bandage, which, for a few days, must be kept wet with tepid water (changing the dressing each day). As soon as the tenderness in the part has disappeared, apply the hard pad in such a manner that the pressure will be made from above downward; in two or three weeks the recovery will be complete. If the internal use of tonics is indicated, the ferri iodidum is preferred.

"In the treatment of virulent or specific adenitis, it must be remembered that suppuration and the entire destruction of the gland are inevitable, and that, before resolution can take place, its entire removal must be accomplished, either by a slow suppurative process, or by surgical interference.

"As soon as the character of the adenitis is determined (which, by the rules before stated in most cases, can be done early), the suppurative process should be hastened by poultices. When the integument over the gland becomes thin and shiny, with a scalpel remove an elliptical portion of the integument of sufficient size to expose the surface of the gland; in many cases the gland will be found isolated from the surrounding tissues by the suppurative process, and attached (as it were) only by a pedicle at its base, in which case it is easily removed with the finger or handle of the scalpel; at other times its removal will be found more difficult, and sometimes it will be found necessary to remove it in separate portions by means of ligatures; but in any event, the entire gland involved should be removed. When this is carefully done, a simple ulcer remains, which heals by granulation with amazing rapidity; and we have accomplished in a few weeks what otherwise often involves months. Before exsecting a gland in the manner described, the character of the adenitis should be accurately determined; and unless its virulence has been decided by a chancre resulting from the inoculation of the pus furnished by the gland involved, it should not be attempted. The removal of a gland in non-virulent adenitis greatly complicates the case, and I have seen very troublesome sinuses result from exsecting glands. Where this mistake had been made, not unfrequently the ulcer remaining after the removal of a gland assumes a chancrous character, when it should be treated in every way like a soft chancre. Every case of adenitis complicating non-virulent chancre that has come under my observation the past year, in which the principles of treatment above detailed have been rigidly followed (where no syphilitic taint was present), complete recovery had resulted within three months from the commencement of the adenitis, and in the majority of cases within four weeks."

This radical method of exsecting glands requires that a good diagnosis should be made, or as Dr. Loomis says, more harm than good may be done.

The same journal contains an account read before the King's County Medical Society, by Dr. J. H. Hobart Burge, of a *New Instrument for Dilatation of Stricture in the Urethra*. It appears to us to be ingenious in principle, and likely to be useful in its application. We have quoted the article in another part of the journal.

The 'Medical Times and Gazette' opens with an article, by Dr. Ramskill, on *Epilepsy*. The author gives a good description of the various forms of the disease, and then considers the comparative feasibility of the various theories that have been propounded as regards its pathology. He prefers his colleague, Dr. Brown-Séquard's, who thinks that it is always the result of an excitation of the cerebro-spinal axis. This view does not appear to differ from Dr. Marshall Hall's. Mr. P. C. Price communicates his experiences of the *Winter Climate of Menton*, the fashionable watering-place at the present time. A favourable description of the water and climate is given. Dr. Druitt reports a *Case of Embolism* in which a venous cast, twenty inches long, was found in the right ventricle. The patient had been suffering from rheumatic pains and catarrh. He was extremely fat, and was well-fed during his illness. He seemed to be improving, when, Dr. Druitt says,

"On the 9th I was sent for at 3 p.m. in great haste, and learned that whilst lying at the edge of the bed, he had slipped off it, and fallen on the floor in a kind of sudden fainting fit, with something like convulsions. I reached him in about ten minutes after this, and could see at a glance that he was a dying man. His breathing was hurried and anxious; the pulse rapid and scarcely perceptible; the features intensely pale, bluish and distressed; the whole surface of the body very cold, and not merely damp but wet with perspiration, which soaked his linen. The feet, hands, and scrotum, livid. The senses were perfect. He said he had no pain anywhere, but that he felt greatly agitated and feeble, and begged for something *calmant*. The ear applied to the front of the chest heard air enter audibly into the air-cells; the beating of the heart was confused and very feeble. The œdema had almost entirely disappeared from the hands and feet.

"Brandy was administered freely by the mouth and by enema; mustard poultices to the epigastrium, and hot bottles to the feet. Nothing, however, gave any relief. The patient was extremely restless, and spite of my cautions not to raise himself, insisted on sitting on the bed-pan, several times trying to pass a motion. He also said he wished to be sick. At last, about six p.m., or three hours after the seizure, the breathing became visibly worse; there were several intense and ineffective efforts at expiration, and after one or two gasps, all was over.

"The diagnosis which I ventured to give to the friends of the patient was that the pulmonary artery was obstructed by some clot or other substance, and I urged the necessity of a post-mortem. Permission was granted, and the operation was performed fourteen hours after death, by my friend, Dr. Peregrine, in presence of Dr. Robert Dickson, who had seen the patient with me during his last moments, and myself.

"The body was fat, and abdomen very large. When the chest was opened, the lungs did not collapse. The thoracic cavity was greatly abridged (as the body lay) by the upward protrusion of the abdominal viscera; for the liver reached as high as between the fourth and fifth ribs on the left side, and the third and fourth on the right. No fluid in either pleura, but the left extensively bound by old firm adhesions. The pericardium contained a considerable quantity of clear serum. The heart rather large, not very fat, pale yellowish, not distended, and with an entire absence of redness, roughening, or other sign of inflammation. The posterior parts of both lungs gorged with black fluid blood; the whole lungs somewhat œdematus. The right auricle contained a contorted mass of fibrine, which was traced into the right ventricle, where it had somewhat the look of chickens' intestines. Portions of fibrinous clot were traced into the right and left pulmonary artery and into their primary branches. The left auricle and ventricle empty. The valves and entire lining membrane absolutely smooth and healthy. The muscular structure yellowish and a little soft. The liver was large and presented great abundance of the yellow circumferential portion of the lobules. The kidneys intensely congested. The examination (which was made in the presence of three friends of the deceased) did not proceed beyond this point.

"*Further Examination of the Clot.*—This examination convinced my colleagues and myself, as I hope my description will convince my readers, that the clot consisted of two distinct elements. (1.) An old element, consisting of firm, pale tubular casts of veins, which had been brought up to, and had passed into the right auricle and right ventricle. (2.) A newer element consisting of fibrine, fresh, loose, and irregular, which had been deposited upon the older clot after it had reached the heart.

"The first piece of clot that I examine, and describe as I examine, is a cylindrical mass, exactly seventeen inches long. At its upper or larger extremity, which is rounded, is a portion an inch and a-half in length, of firm, dark clot, a little flattened, and half an inch in its larger diameter; next to this is a little constriction, and a short branch at an angle; next to that comes a portion six inches long, about one-third of an inch in diameter, tolerably even, and somewhat tapering, consisting of a firm, white, fibrinous exterior, and of darker firm clot within. It shows two oval marks, which look as if they correspond to the apertures of branches of veins. After the six inches, a little branch is given off, the size of a crow-quill, and one and a-half inch long. Then follow eight and a-half inches more of firmer and more decolourised fibrinous cast,

of gradually decreasing size; the outer layers in some places easily detached, and showing darker clot within; and, at the end, an inch and a-half of thin irregular clot. This long portion of clot lay partly in the auricle, partly in the ventricle; and it was, as I have said, coiled up, and looked like chickens' guts.

"A second mass, lying before me, was taken from the apex of the right ventricle. It is a mass of soft irregular fibrine, like that which is often found in the heart; but it contains imbedded in it two portions of tubular clot, one an inch and a-half, the other two inches long, which were evidently, in removing it, broken from the longer portion already described, and once were continuous with it. These lie imbedded in the looser recent clot, but evidently form no part of it, and are distinct from it in configuration, colour, and consistence. They are as tubular as, and about the size of macaroni, and these portions are the palest and firmest of the whole clot.

"A third portion is about two inches long, the size of a small quill, and consists partly of firm clot, and partly of looser fibrinous deposits outside it.

"The right and left pulmonary artery, and their leading branches, contained also fibrinous plugs, but so loose, soft, and friable, that they readily tore, and could not be removed, entire nor preserved: whereas the cylindrical portions described above are pretty nearly as tough as the chicken's guts, to which I have compared them.

"*Remarks.*—The examination of these clots, taken side by side with the symptoms of the poor patient's mortal agony, leaves no doubt in my own mind as to the pathology of the case. It is clear that in the chief veins of one thigh there had been a fibrinous deposit on the lining membrane, at first limited and allowing the blood to pass easily, then gradually creeping upwards and obstructing the canal, till at last a length of twenty inches (most likely from the popliteal to the external iliac vein) became filled with a solid plug. Of this plug it was evident that the uppermost and larger portion was the newest, least firm, and least decolourised, and it ended above in a smooth round ending, as has been well described by Dr. Benjamin Ball in his 'Traité des Embolies Pulmonaires.' The œdema of both legs which existed on the 6th, 7th, and 8th has been mentioned, and its disappearance on the 9th; but it must be observed that the patient complained of no pain in either thigh; there was no *phleymasia dolens*, and nothing to call special attention to the veins. It is to be regretted that the post-mortem could not be extended so as to clear up the question as to the original site of the clot; nevertheless, as it lies there before me, it is clear that such a coagulum could not have been formed in the heart, and that it must have been transported from some part of the venous system.

"In the next place, I would desire attention to the fact of the formation of fibrinous coagulum within the heart and pulmonary artery, in addition to that which was brought there and as a consequence of it. Disputes have existed, as is well known, as to the origin of pulmonary and right ventricle *emboli*, some contending that they are autochthonous or formed *in situ*, whilst others have proved their transplantation. This case clearly proves both opinions to be correct, and I think that many an observer, misled by a mass of recent fibrine, may have overlooked an older venous cast imbedded in it.

"The symptoms admit of as positive a diagnosis as possible. A patient is seized suddenly with symptoms of intense disturbance and feebleness of the heart. Respiration is difficult and laborious, yet air enters the lungs freely. The beat of the heart has lost rhythm and force, and is no more than a feeble *wobble*. The surface is intensely cold, pale, and bluish, and drenched in perspiration. There is death in the face, but the intellect is undisturbed. All these symptoms point to a sudden mechanical interference with the circulation; and of the sources of such interference embolism is the most probable.

"The knowledge of this pathological process enables us to get rid at once of some of the mythical and purely dynamic theories of sudden death with which our fathers were obliged to be content. Formerly this case would have been chronicled as one of sudden retrocession of gout or of rheumatism, or of gout in the stomach, or palsy of the heart, or sudden inflammation of that organ. Now, at least, some cases are shown to depend on mechanical and intelligible conditions.

"Such cases are by now means rare. This is the second I have seen this year. In the former, an elderly woman, phthisical and with swelled leg, was seized with all the symptoms above described, and died in six hours. I pronounced the cause to have been what I am now treating of, but was not allowed to prove it by a post-mortem. The moral is, that in no case of swelled legs or sub-inflammatory condition of the veins should the possibility of this mortal accident be overlooked."

The 'Lancet' commences with a continuation of Mr. JOHN HILTON's lectures on *Pain*. Mr. Hilton reports cases of Hip-joint disease cured by rest, and he narrates briefly a striking case of a large abscess in the dorsal region absorbed by the aid of the same simple means.

"I have here the drawing of the back of a man who had a very large abscess projecting backwards, and associated with diseased spine in the dorsal region. That large abscess, holding, I should think, a pint and a half of fluid, received a distinct impulsive movement from the interior of the chest during coughing or a full inspiration. By rest in bed for several months the spine disease was cured; and by blistering and rest the abscess subsided—in fact, was gradually absorbed. This case was under my care at Guy's Hospital last summer; I have seen the man quite lately, and he has not the slightest remains of anything wrong about the spine, and the abscess does not now exist in the slightest degree."

With reference to opening abscesses, he remarks:—

"It may be asked—What are the conditions of an abscess associated with hip-joint disease which recommend or justify making an opening into it by the surgeon? I should say, with all reasonable submission to the experience which I see before me—If the abscess be enlarging very rapidly, and Nature seems incompetent, from her feebleness (a bad indication), to make a successful effort to limit it by a natural barrier, the opening may be made, and half, or more, of the pus be drawn off (without squeezing the abscess.) The opening should be immediately and carefully closed up, lest the outpouring of the fluid may be continuous, and a drain of pus be produced so as to affect the general health; the abscess to be subsequently supported by plaster or bandage, in order to keep it at rest.

"If the walls of the abscess be inflamed, hot, and painful, with great febrile and constitutional disturbance,—or if the abscess contain air, (resonant on percussion,) from decomposition, mixed with the fluid, the opening ought to be made complete, large enough, and at the most depending part of the abscess, so as to allow gravitation to determine at once the evacuation of the whole of the fluid in the abscess. And subsequently the walls of the abscess should be kept in contact for the purpose of inducing, by pressure and rest, mutual adhesion, and of limiting the extent of surface capable of secreting too abundantly *pus*, *serum*, or *lymph*, which would diminish both the quality and quantity of the blood, and so deteriorate the general health.

"I felt myself bound to refer to this subject of abscess associated with diseased joints, because my experience will sustain my recommendation as to what should be done in such cases; and, further, because it is a fact, that by the bedside surgeons are often in doubt as to what course they should pursue, and I hope the facts and arguments which I have adduced to day may be a slight contribution or help towards a right determination on this subject."

Mr. ERNEST HART reports *Cases in Operative Surgery*. They are cases of resection of the maxillæ, hip, elbow, and wrist-joints. Dr. GOODWIN communicates an article on *Syphilitic Affections of the Brain*, which possesses much interest.

GENERAL CORRESPONDENCE.

MURDER OF A UNION MEDICAL OFFICER, AND MUTILATION OF THE BODY.

To the Editor of the Medical Circular.

SIR,—Your readers are already acquainted with the terrible death of Mr. Adam Stapleton Puckett, Medical Officer of the Weymouth Union, by an insane pauper. I will not, therefore, enter into the details of this horrible murder and barbarous mutilation, but at once beg you will permit me, through the medium of your valuable journal, to appeal to the benevolence of the public and Medical Profession on behalf of the widow of the deceased, who is left nearly destitute.

I have known the late Mr. Puckett for upwards of twenty years, he having been the assistant of my predecessor; I can therefore bear testimony to the fact that he was a hard-working, kind-hearted man—an apothecary of the old school,—and as attentive to the poor as an enormous district, or rather two combined, which extended fifteen miles across the country, would permit. Why he had such a district, I must leave the Poor-law Board and Board of Guardians to answer; that it was cruel to the poor there can be no question, as some of his patients had to walk nine miles for a bottle of medicine, and as many home again, making Medical Relief a mere mockery, but I trust the Select Committee of the House of Commons on Poor Relief before whom evidence on this subject has already been laid, will recommend to Parliament a material change in the medical arrangements for the relief of the poor.

It was given in evidence at the inquest, that poor Puckett only visited the maniac twice a week, and in reality was unaware of his dangerous state, which more frequent visits would have revealed to him; but his enormous district prevented him doing more, as his salary of 116*l.* per annum, including extra medical fees, miserable for such a district, allowed him to keep but one horse; for out of that salary he had not only to pay for the keep of that horse, but

had to find drugs for the poor, to maintain himself, his wife, and one daughter to look after the house, and her mother, who has been for the last few years incapable of attending to the household duties.

How poor Puckett, out of so miserable a pittance, managed to do all this, is a mystery, as I know, for a certainty, that during the last six months, his entire booking from private practice has been only Twenty-three Pounds; and yesterday I was assured by a member of his family that at the time of his death he had but twenty-one shillings in his possession, besides the few shillings which the maniac took from his pocket and threw into the river; the widow is therefore left nearly destitute—I say nearly, as there is a small insurance on his life, which I was instrumental in his effecting, but I find that is heavily mortgaged to meet incumbrances occasioned by sickness, and the probability is that the rest will be swallowed up in funeral expenses, and the payment of debts.

After this brief recital I feel I shall not appeal in vain to the generosity of the public for a widow whose husband was so barbarously murdered, and horribly mutilated. I have opened an account "The Puckett Fund." at Messrs. Williams' Bank, Weymouth, and at Messrs. Eliot's Bank, Weymouth, where subscriptions may be forwarded, or they may be sent to me, and I will act as Treasurer to the Fund until means shall be devised to place the money in the hands of Trustees for the benefit of the widow, and, if there be sufficient, such members of the family of the deceased as the Trustees may deem it desirable to assist. Mr. Puckett left one son and three daughters, all of whom are incapable of assisting their mother.

I am, sir, your obedient servant,
Richard Griffin, J.P.

12, Royal Terrace, Weymouth,
July 12, 1862.

POISONING FROM EATING KEATING'S COUGH LOZENGES.

To the Editor of the Medical Circular.

Sir,—On July 5th, I was called to see two little girls who had eaten betwixt them six or eight of Keating's cough lozenges. The younger one, four years of age, said that her sister had given the greater part of them to her. They ate the lozenges about eleven a.m., and were seemingly well until after they had taken dinner at half-past twelve. As they rose from table, they were seized with sickness of so persistent a kind that I attributed it to ipecacuanha. The elder one, nearly six years old, showed some disposition to sleep, but not such as to cause alarm. She was still troubled with occasional vomiting when I saw her at 3.30 p.m., but this was at once relieved by drinking a cup of strong tea. The younger one had not vomited so freely, but was labouring under evident signs of opium poisoning. The pupils were contracted, and when roused and questioned, the child complained of headache. I found it a difficult task to keep her awake, and yet; if I might credit the statement of the mother and attendants, they had had still greater difficulty in doing so.

I promoted the vomiting with ipecacuanha, and afterwards gave strong coffee. She was then taken into the open air for a time, which means effectually roused her. The children may have eaten a greater number of lozenges than I have stated above, but there was no evidence to speak positively on the subject.

I communicate a notice of these cases, because it is a general opinion with the public that Keating's lozenges contain nothing likely to induce narcotism.

Here, however, is direct evidence to the contrary.

I am, sir, yours, &c.,
E. G. Wake.

North Collingham, Newark,
July 18, 1862.

[Instances of malaise and incipient poisoning from eating cough lozenges are not at all infrequent. Every parent should prohibit the use of such secret and dangerous preparations.—Ed. Medical Ciruclar.]

FATAL CASE OF PARALYSIS AFTER DIPHTHERIA.

To the Editor of the Medical Circular.

Sir,—I was called to see the child of W. W., a baker, on the 27th of May. He was a fine, healthy-looking child of three years, complaining of sore-throat. On examination, I discovered diphtheric patches on both tonsils. The case, though protracted till the 16th of June, was by no means severe, and perfectly recovered under the use of chlorate of potass and iron, and the application of nitrate of silver. The child, however, continued weakly, and was ordered quinine.

On the 2nd of July, after my attendance had ceased, the parents discovered he had lost the ability to stand on his legs, though retaining the power to move them; the arms, also, were semi-paralysed, and the head drooping, as though from inability to keep it up.

This was the condition in which I found the child, when again called to see it on the 17th of this month. There was also a loss of articulation in some degree, but not wholly; no amaurosis or squinting, nor any deafness; the appetite was pretty good, the countenance having a listless expression. A combination of quinine and strychnine was ordered, but before he had got any of the medicines I was suddenly called to see him, later in the day. He had just wakened out of sleep, and was gasping for breath, evidently from paralysis of the respiratory muscles. The heart continued to beat for a short time, but death rapidly ensued, accompanied by relaxation of the sphincters. The paralysis, though recognised for some time, was considered merely as weakness by the parents, and possibly excited the less alarm from its being the first case known in this quarter, and the comparative mildness of the previous complaint.

I am, &c.,
Broughty Ferry. J. H. Park, M.D.

MEDICAL SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

Dr. Babington, President, in the Chair.

Mr. James Paget communicated some

CONTRIBUTIONS TO THE STATISTICS OF CANCER.

The cases of cancer from which this paper was constructed were 500 of those recorded by Mr. Paget between the years 1843—1861, and all of which had come under his own observation. Only the external or so-called surgical cancers were included in this number.

The first part of the paper showed the proportion of cases in each organ and each sex, and the per-centage of the several kinds of cancer,—each part of the body being attacked, as a rule, by one form of the disease almost exclusively. The greater frequency of cancer in females was found to be due to cases of scirrhus of the breast; in the cases, in almost all the other external organs, especially those subject to epithelial cancer, the proportion of males was greatest.

The influence of age was next noticed, and the increasing liability to cancer as people advance in life; the absolute number among the 500 cases at each age being given, and also the relative frequency in proportion to the whole population living at the same period. In external organs, medullary was found to be the most frequent variety in youth; scirrhus and epithelial in middle and old age. The number of females affected with cancer, in proportion to the whole population, was found to increase rapidly from the earliest age up to 40—50, and then more gradually decline. In males the number increased up to the age 50—60, and after this declined again, the rise and fall being both of them more gradual than in females. The kind of cancer to which each sex was most liable accounted for the difference.

The condition of the female patients—whether single, married, or widow—was noticed, and also the influence of each on the production of cancer. The proportion of cases of cancer in the breast was found to be greater in the married than in the single, both absolutely and in proportion to the number in which the two classes exist in the community.

The state of health of the patients at the time of the beginning of the disease was ascertained, and found to be good, in a very large majority; a rather larger proportion of the medullary and epithelial than of the scirrhous being in bad health at this date.

The question of cancerous inheritance was in the next place considered, and answered in the affirmative, 24 per cent. of the patients giving a history of cancer in other members of the family; the per-centage, too, in the private cases, in which the family history would be better known, was considerably greater than in the hospital. The variety of cancer was not always the same in all the members of the family attacked.

Tables of the date of recurrence after operation were given, and the several kinds of cancer compared in this respect; the average number of months which elapsed between the date of removal of the primary disease and the recurrence was greatest in scirrhus, and least in epithelial, but a larger proportion of cases of the last variety remained without any recurrence for a period far beyond the average.

The date of recurrence after early and late operation was compared; the difference between the two being but small, probably from the acute cases being the earliest to be removed and to return.

One or two of the cases, remarkable by their long-deferred recurrence, were given more in detail.

The last part of the paper was devoted to considering the duration of life, especially with the object of comparing the cases of operation with those in which the primary disease was not removed.

The greatest difference in the two sets of cases was found to exist between the epithelial cancers, and the least between the medullary; but a marked increase of life on the side of the operations was present in all the varieties. Part of this result is, of course, due to the selection of cases for operation.

Some of the organs were compared separately, and the same

advantage on the operation side was shown in each, with one exception—viz., the bones, in which the duration of life was exactly the same on both sides.

The influence of early and late operations in respect to the duration of life was also considered, and, as in the recurrences, only a slight difference was observed; indeed, the length of life was greater in the cases in which the operation was performed at two to five years after the first observation of the disease than in those at one to twelve months, the forming being all chronic cases.

Lastly, the duration of life in the hospital and private cases was compared, and the advantage shown to be on the part of the hospital. Some of these difference may, however, be accounted for by a larger number of the hospital cases being submitted to operation.

Mr. Henry Lee related a

CASE OF ANEURISM OF THE INTERNAL ILIAC AND COMMON FEMORAL ARTERIES, TREATED BY DIGITAL PRESSURE.

The history of the case was given at length. From the symptoms observed, it appeared that the digital pressure had the effect of producing a very firm coagulum in the sac of the aneurism. But as the artery was unusually brittle, the upper part of the aneurismal sac had become completely separated from the lower part. The coagulum formed was consequently unsupported by any of the coats of the artery, and after a time gave way. The blood was effused in the thigh and in the pelvis; and those portions of periosteum which were in contact with the effused blood had numerous minute fresh formations of bone upon their surface. These little bony formations could be readily detached with the nail. From the descriptions of the remains of the aneurismal sac, and from the drawing which accompanied the paper, it appeared how impossible it would be in such a case to tie the arteries from within the sac, as had lately been proposed in the Society. The ligature of the external iliac artery, in the case related, would not have succeeded. The upper and lower portions of the artery having been completely divided, any coagulum which formed, whether in consequence of ligature or compression, must ultimately have given way.

JURY AWARDS AT THE INTERNATIONAL EXHIBITION.

Surgical Instruments.—(Medals.)

United Kingdom.—Ashe, C., and Sons; Bailey, W. H.; Barling, J.; Bigg, H. H.; Brown, S. S.; Coxeter, J.; Durroch, W. F.; Ernst, F. G.; Evans and Stevens; Evrard, J.; Ferguson, J. and J.; Gray, J., and Co.; Grossmith, W. R.; Hilliard, W. B.; Hooper, W.; Lawson, Buxton and Co.; Lemale, T., and Co; Longdon F., and Co.; Masters, M.; Matthews, W.; Norman, S., jun.; O'Connell, E.; Pratt, J. F.; Rein, Mrs. S.; Savory and Moore; Simpson, H.; Spratt, W. H.; Weedon, T.; Weiss and Sons; Westbury, R.; Whicker and Blaise; Whibley, E.

Austria.—Czermak, Dr. J.; Hebra, Dr. F.; Hyrtl, Prof.: Leiter, J., Türck, Dr. L.

Denmark.—Nyrop, Prof. C.; Rasmussen, A.

France.—Auzoux, L., Dr.; Béchard, R. L.; Charrière, J. J.; Duchenne, G., Dr.; Francois and Fouquet; Galante, H.; Grandcollot; Lackerbauer, P.; Lami, A.; Lavezzari, E.; Lebelleguie, P. J.; Lüer, G. G. A.; Marey, J., Dr.; Mathieu, L. J.; Mericant, E.; Nachet and Son; Preterre, P. A.; Sales-Giron, Dr.; Thiers, L. P. T.; Wickham.

Sweden.—Cavalli, J. G.

United States.—Philadelphia College of Pharmacy.

Wurtemberg.—Bohringer, C. F., and Sons; Walff, F. A., and Sons.

In the absence of Wm. Lawrence, Esq., F.R.S., Deputy Inspector-General T. Longmore, Professor of Military Surgery at the Army Medical School, acted as Chairman of the Committee of Class XVII., Surgical Instruments, and received the Jury Awards from H.R.H. the Duke of Cambridge, at the State Ceremonial of the International Exhibition on the 11th instant.

DEATH OF DOCTOR BERNARD OF CORK.

We regret to have to record the death of Dr. Bernard, at his residence, South Mall, on the 9th inst., from typhoid fever, of the worst character, taken while in the discharge of his duties as dispensary medical officer of the centre district of our city. His death, we are sorry to have to report, is the third that has occurred within the short space of a week from the same class of fever that Dr. Bernard died of. Most of us as we see the medical man walking or driving through our streets, imagine that it is a very fine thing to be in such repute, as to be either constantly on foot, or on a car going from house to house, and as the vulgar expression is, making money; but if we look a little closer into the life of the medical man, we shall see that his life is not as we might at first suppose, all *couleur de rose.* There is a fearful anxiety and tremendous responsibility, a harassing suspense, that in the end makes the young man old, the most frivolous and trifling of the profession thoughtful and sad; and how much the more must this anxiety be increased, when we come to consider the daily life such as Dr. Bernard led? The district of which he had the care is one of the thickest inhabited of Cork, as it takes in all the centre of the city. Just let us for a moment imagine all the lanes in this district, and those full of houses, and each house again full of families, each family numbering on an average from six to eight human beings, and we are amazed to think how one individual can have accomplished the mass of work to be got through; it was done, done well, done conscientiously; but the doer is dead! We happened to be in the room of the dispensary where he used to prescribe for the externs to-day, and as the medical man who since his illness (only eight days) had taken his post, announced his death, there was a kind of solemn awe stole over the crowd that was grander than the grandest service ever intoned in the aisle of Westminster to departed genius, or the proudest monument ever reared to our greatest statesmen. And now, as we are on the subject of dispensaries, could not the committee, whom we believe sit fornightly, relieve the medical dispensary officer from many of the petty annoyances that he is at present liable to? for instance, could not they provide a porter to keep some sort of order in the prescribing rooms, and not let the number of people crowd in on the medical officer all at once, thus hindering him from doing his duty with that ease and calmness that he would require when examining difficult cases? As we have visited these rooms, and seen what the medical officers have to do, we beg of the committee to do the same; stay with the medical man as he prescribes; with the apothecary as he dispenses, and then, and not until then, will they have the slightest idea of the work gone through by those gentlemen, who, we are sorry to have to write it, many of the committee think little better than mere servants, and when it comes to £ s. d. with them will vote for the smallest possible sum to support men who risk their lives to relieve their fellow-creatures from sickness, and rescue them from death.—'Cork Reporter.'

Births, Marriages, and Deaths.

BIRTHS.

Hodges.—On the 7th inst., at Watton Cottage, Hertfordshire, the wife of Herbert B. Hodges, Esq., M.R.C.S., of a son.

Strever.—On the 4th inst., at Bexley heath, Kent, the wife of T. R. Strever, Esq., F.R.C.S., Retired List, H.M.'s Bengal Army, of a son.

Todman.—May 26, at Magill, South Australia, the wife of James Todman, Esq., M.D., of a son.

MARRIAGES.

Meadows—Gordon.—On the 2nd of May, at the Church of the St. John Del Rey Mining Company, Minas Geraes, Brazil, Henry Frederick Meadows, Esq., M.R.C.S.E., Principal Medical Officer of the Establishment, to Jane Grieve, oldest daughter of James N. Gordon, Esq., F.R.S.A., late of the Priory, Islington, and Superintendent of the St. John Del Rey Mining Company, Brazil.

Nairne—Syme.—On the 2nd inst., at Jamestown, Alexandria, John Nairne, M.D., of Perth, to Jessie Crichton, second daughter of the late William Syme, Esq., of St. Andrews.

SIMPSON—HEWSON.—On the 2nd inst., at St. Giles's Church, Bloomsbury, Andrew Simpson, M.D., late of the Medical Service, Madras, to Mary Hewson, of South crescent, Bedford square.

WATERS—BURGESS.—On the 3rd inst., at St. George's, Bloomsbury, John Waters, Esq., M.R.C.S., of Southampton street, Bloomsbury, to Mahalah Deverenx Burgess, eldest daughter of William Burgess, Esq., of Cannon street, City.

DEATHS.

BEAUFOY.—June 21, at Portsea, Hants, Charles Beaufoy, late Assistant-Surgeon, H.M. 25th Regiment of Foot.

CODRINGTON.—May 3, from a fall from his horse, at Braidwood, New South Wales, George Frederick Codrington, M.D., aged 50.

DAVIES.—On the 8th inst., Richard Wright Davies, M.R.C.S. Eng., L.S.A. Lond., of Great Rrooke street, Birmingham, aged 39.

EVANS.—On the 9th inst., Richard David Jones Evans, M.D. Mar. Coll. Univ. Aberd., F.R.C.S. Eng. (Hon.), L.S.A. Lond., Senior-Surgeon to the Hertford General Infirmary, of Hertford.

LEECH.—On the 7th inst., at Carlton terrace, Rathmines, Dublin, Robert Leech, M.D., aged 67.

LUDLOW.—April 21, Henry Christopher Ludlow, M.D., of 14 Chapel place, Vere street.

SEMPLE.—At Grove house, Castlebar, co. Mayo, Charles William Semple, A.B. Trin. Coll. Dub., L.R.C.S. Irel., L.M. Rotunda Lying-in hospital, Staff Assistant-Surgeon, Army, aged 26.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—At the Comitia Majora, held on Saturday, July 12th, the following gentlemen, having undergone the necessary Examination, and satisfied the College of their proficiency in the Science and Practice of Medicine and Midwifery, were duly admitted to practise Physic as Licentiates of the College :—Messrs. Julius St. Thomas Clarke, Leicester; Edward Smith, 1 St. George's place; William Lyons, M.D., Madras; William Horton Trevor Power, University College; Edward Livesay Dixon, Preston; Henry Marshall Rowland, Bootle; William Walls, Hindley, near Wigan; and William Partridge Mills, Ipswich.

MIDDLESEX HOSPITAL MEDICAL COLLEGE.—The Distribution of Prizes took place on July 11th, 1862, Captain the Honourable Francis Maude, R.N., in the chair.—*Prizes and Certificates of Honour awarded to First Year's Students.—Summer Session*, 1861.—First Prize, Mr. John Ablewhite Smith, Louth; Second Prize, Mr. Alfred Brend, Bideford, Devon. CERTIFICATES OF HONOUR.—*Materia Medica* (Dr. H. Thomson).—Mr. J. A. Smith, Mr. A. Brend, Mr. G. E. Pyle, Amesbury, Mr. H. W. Freeman, Bideford. *Botany* (Dr. T. Spencer Cobbold).—Mr. J. Ablewhite Smith, Mr. Alfred Brend, Mr. George E. Pyle, Mr. Henry William Freeman. *For Herbaria*—Mr. T. Lucas, Burwell, Cambridge, Mr. E. Snell, Plymouth, Mr. J. Fernie, Kimbolton. *For Botanical Dissections*—Mr. Ebenezer Snell, Mr. Thomas Lucas. *Practical Chemistry* (Mr. Taylor and Mr. Heisch)—Mr. J. Smith, Mr. G. E. Pyle, Mr. M. de G. Hurlestone, London, Mr. A. Brend; Mr. A. Bick, Minehinhampton, and Mr. H. W. Freeman.

Winter Session, 1861-62.—First Prize, Mr. Henry William Freeman, Bideford; Second Prize, Mr. George Clements, Brixham, Torbay, and Mr. Robert King, Moulton, Lincolnshire. CERTIFICATES OF HONOUR.—*Anatomy* (Mr. Moore)—Mr. H. W. Freeman, Mr. Robert King, Mr. G. Clements, Mr. Alfred Bick, Mr. H. Basan, London. *Physiology* (Mr. De Morgan)—Mr. Henry William Freeman, Mr. George Clements, Mr. Robert King, Mr. Alfred Bick, Mr. C. E. H. Rogers, Westmeon, Hants., Mr. E. Norton, Birmingham. *Chemistry* (Mr. Taylor and Mr. Heisch)—Mr. H. Cribb, Bishop's Stortford, Mr. H. W. Freeman, Mr. H. P. Chandler, London, Mr. Robert King, Mr. G. Clements, Mr. E. Norton.

Prizes and Certificates and Honour awarded to Second Year's Students.—Summer Session, 1861.—First Prize, Mr. Edward Morgan, Nantybenglog; Second Prize, Mr. John Wallis Mason, London. CERTIFICATES OF HONOUR.—*Midwifery* (Dr. Priestley)—Mr. Edward Morgan, Mr. John Wallis Mason, Mr. William D. Spanton, Mr. C. P. Langford, Hingham, Mr. Richard Purnell, Wells, Mr. L. F. Osbaldestone, Hatfield, Mr. Woodfield Eagles, Aylesbury. *Forensic Medicine* (Mr. Henry and Dr. Greenhow)—Mr. John Wallis Mason, Mr. William D. Spanton, Mr. Edward Morgan, Mr. Charles Phineas Langford, Mr. Lyttleton F. Osbaldestone.

Winter Session, 1861-62.—First Prize, Mr. John Ablewhite Smith; Second Prize, Mr. Thomas Lucas. CERTIFICATES OF HONOUR.—*Medicine* (Dr. Stewart and Dr. Goodfellow)—Mr. J. A. Smith, Mr. G. E. Pyle, Mr. T. Lucas, Mr. A. Brend, Mr. Albert Weaving, Oxford. *Surgery* (Mr. Shaw)—Mr. J. A. Smith, Mr. T. Lucas, Mr. G. E. Pyle, Mr. A. Brend, Mr. F. H. Alderson, Ipswich, Mr. W. G. Curgenven, Plymouth, Mr. A. Weaving, Mr. C. J. Pyle, Amesbury. *Anatomy* (Mr. Moore)—Mr. Thomas Lucas, Mr. J. Ablewhite Smith, Mr. Alfred Brend, Mr. William G. Curgenven, Mr. John Ring, Wincanton, Somerset, Mr. Geo. E. Pyle, Mr. Albert Weaving, Mr. James S. Turner, London, Mr. Ebenezer Snell and Mr. A. Waymouth, Stoke, Devonport, Æq., Mr. Fred. H. Alderson, Mr. Charles J. Pyle. *Physiology* (Mr. De Morgan)—Mr. J. Ablewhite Smith, Mr. Thomas Lucas, Mr. Albert Weaving, Mr. Alfred Brend, Mr. George E. Pyle, Mr. Fred. H. Alderson, Mr. Albert Waymouth, Mr. James Smith Turner, Mr. William Grafton Curgenven. *Pathology* (Mr. Sibley and Dr. Murchison)—Mr. J. Ablewhite Smith, Mr. Albert Weaving, Mr. Thomas Lucas, Mr. Alfred Brend, Mr. George E. Pyle, Mr. Charles J. Pyle.

Prize offered by the Medical Society for the best Paper of the Session, Mr. John Ablewhite Smith. *Prizes awarded to Third Year's Students*—Clayton Prize for Comparative Anatomy—Prize, Mr. William Montagu Hall, Welby, Newark; Certificate, Mr. James Edward Bennett, Devonport. Prize in Clinical Medicine—First Prize, Mr. Charles Wightwick Pitt, Malmesbury; Second Prize, Mr. Lyttleton F. Osbaldestone. Prize in Clinical Surgery—First Prize, Mr. Woodfield Eagles; Second Prize, Mr. Charles Wightwick Pitt. Governors' Prize (for the best Reports in both Clinical Medicine and Clinical Surgery), Mr. William Dunnett Spanton, Loughborough. *Honorary Certificates of General Good Conduct and Diligence*, Mr. Henry C. Bury, Mr. Philip A. Cornish, Mr. Woodfield Eagles, Mr. M. de G. Hurleston, Mr. Thomas Joyce, Mr. C. P. Langford, Mr. William E. Lee, Mr. John W. Mason, Mr. Edward Morgan, Mr. L. F. Osbaldestone, Mr. Charles W. Pitt, Mr. Richard Purnell, Mr. S. Rutherford, Mr. William D. Spanton, Mr. W. M. H. Welby.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, July 10, 1862 :—John Foster, Bradford; Charles Noyce Kernot, West Cowes, Isle of Wight; William Walls, Hindley, Lancashire; John James, Cardigan; Sloane Michell, Minehead, Somerset; William Bazeley, 5 St. Aubyn street, Devonport; Richard George White, Melton Mowbray, Leicester; Charles Ebenezer Harle Islington; John Roberts, Kidwell, Carmarthenshire; John Hamer Oliver, Llandysilio, Montgomeryshire. The following gentlemen also on the same day passed their first examination :—Horatio Bate Goold, William Adolphus Frederick Caudle, and Matthew Leach, King's College; Henry Addison Hobbs and Thomas Griffiths, St. Thomas's Hospital; Thomas Carter, Guy's Hospital; Charles Spurway, St. Bartholomew's Hospital.

APPOINTMENTS.—Sir James Lomax Bardsley, Knight, M.D. Univ. Edin., F.R.C.P. Lond., has been appointed Deputy Lieutenant for the County Palatine of Lancaster.—Thomas George L'Enardi Baretti, M.R.C.P. Eng., L.S.A. Lond., has been elected Surgeon to the Free Institution for Diseases peculiar to Women and Children, St. James's-square, Bristol.—John Morgan Bryan, M.D. Univ. King's Coll. Aberd., F.R.C.S. Eng., L.S.A. Lond., has been re-elected Treasurer and one of the Joint Secretaries of the South Midland Branch of the British Medical Association.—Joseph Clough, L.R.C.P. Edin., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the newly-formed district of Woodhouse, in the Huddersfield Union, Yorkshire, comprising Bradley, Deighton, Sheepridge, and Coneliffe.—Henry Day, M.D. St. And., Ext. L.R.C.P. Lond. (exam.), M.R.C.S. Eng., L.S.A. Lond., has been elected one of the Physicians to the Staffordshire General Infirmary, Stafford.—Peter Martin Duncan, M.B. Univ. Lond., M.R.C.S. Eng., has been appointed Consulting-Surgeon to the Essex Hall Asylum for Idiots.—George Pocock Goldsmith, M.R.C.S. Eng., L.S.A. Lond., has been elected Joint Secretary (with Dr. Bryan) of the South Midland Branch of the Medical Association, *vice* Robert Charles Hurst, M.R.C.S. Eng., L.S.A. Lond., deceased.—Frederick Greenwood, M.R.C.S. Eng., L.S.A. Lond., has been appointed Surgeon to the Huddersfield and Upper Abrigg Infirmary, *vice* William Greenwood, F.R.C.S. Eng., L.S.A. Lond., resigned.—Hugh Spencer Hughes, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Walsham-le-Willows District (No. 6) of the Stow Union, Suffolk, *vice* Walton Kent, L.S.A. Lond., deceased.—John Ireland, M.R.C.S. Eng., L.S.A. Lond., has been elected Vaccinator for the Kingswinford District, Stourbridge Union, Worcestershire.—Robert Law, M.D. Univ. Trin. Coll. Dub., Hon. F.Q.C.P. Irel., has been appointed Professor of the Institutes of Medicine at the School of Medicine and Surgery, Trinity College, Dublin, for a further term of seven years.—Edward Lynes, M.D. Univ. St. And., M.R.C.S. Eng., and L.M., L.S.A. Lond., has been appointed Surgeon to the Coventry and Warwickshire Hospital, *vice* John Walter Bury, L.R.C.P. Edin. (exam.), M.R.C.S. Eng., resigned.

OXFORD UNIVERSITY.—At a Congregation held on the 3rd inst., the degree of Bachelor of Medicine was conferred on C. D. Macleane, Exeter College.

MEETING OF THE BRITISH MEDICAL ASSOCIATION.—A *conversazione* will be held at the College of Surgeons, on the 5th August, and one at the College of Physicians, on the 6th, to receive the Members of this Association.

THE CORONERSHIP FOR THE WESTERN DIVISION OF MIDDLESEX.—The official declaration of the poll for the Coronership of the Western Division of Middlesex was made on Wednesday last, at Brentford, by Mr. Sheriff Twentyman, who intimated that the election had fallen on Mr. James Bird by a majority of 382; the numbers being.—for Mr. Bird, 1,143; Mr. F. Charsley, 761.

APPOINTMENTS FOR THE WEEK.

Wednesday, July 23.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopœdic Hospital, 2 p.m.

Thursday, July 24.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

LONDON SURGICAL HOME.—*Operations:* 2 p.m. Two Cases of Vesico-Vaginal Fistula; Fibrous Tumour of the Uterus.

Friday, July 25.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, July 26.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 2 p.m.; Charing-cross Hospital, 2 p.m.

Monday, July 28.
Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, July 29.
Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

Incontinence of Urine. By Dr. W. A. Smith. Second Edition. London: H. K. Lewis, 15 Gower street, North.
Notes on Spa. By Dr. T. Cutler.
Vichy and its Mineral Springs. By Dr. Edwin Lee. London: John Churchill, New Burlington street.
A Notice of Mentone. By Dr. E. Lee. London: W. J. Adams, 59 Fleet street.
Clinical Medicine. By Dr. W. T. Gardiner. Edinburgh: Edmiston and Douglas.
Report of the Guardians of the Poor of St. Martin's-in-the-Fields.
On the Therapeutic Law of Specific Remedies. By Arthur de Noé Walker, Esq. London: G. Clayton, 315 Regent street.
On the Therapeutic Action of Atomic Doses. By Arthur de Noé Walker. London: Turner and Co., 77 Fleet street.
On the Prevailing Ignorance of the Materia Medica in the recognised Schools of Medicine. By Arthur de Noé Walker. London: G. Clayton, 315 Regent street.
Chemist and Druggist for July.
General Debility and Defective Nutrition. By A. Smee, Esq., F.R.S., &c. Second Edition. London: John Churchill.

NOTICES TO CORRESPONDENTS.

MR. MILTON AND HIS CRITICS.
To the Editor of the Medical Circular.

SIR,—Your reviewer, in a critique on my work on 'Gonorrhœa,' says that I begin with a fierce attack on the critics. Pardon me for saying that I have done nothing of the kind. I have most distinctly stated that I had no quarrel with the critics, and had no reason to quarrel with them. I simply meant to attack those *few* who had *wantonly* assailed others; the manglers of the press. I thought I had said this so clearly that it would not be easy to mistake my meaning.

Your reviewer says this kind of thing will do me no good. More is the pity, then, if a writer cannot reply to a malicious onslaught without suffering for it. I must, however, venture to doubt the conclusion he draws. From all sides I have heard but one opinion on the subject, and that a very different one.

Trusting you will do me the honour to insert this,

I remain, Sir, &c., J. L. MILTON.

24 Castle street, July 14, 1862.

Dr. KNOX.—Received.
F.R.C.S.—M. Nelaton's operation of ovariotomy was not the *first* successful one that has been performed in France; there having been three others antecedent to his.
P. P.—Our attention has been already drawn to the subject. We cannot express our opinion upon it until Dr. Clay has made his own statement.
MR. ARTHUR DE NOE WALKER.—Letter received, but as it refers to matters that have appeared in another journal we cannot insert it.
Mr. YOUNG.—1st. Yes.—2nd. Yes.
J. H.—One of the best disinfecting agents that can be employed is Condy's fluid, consisting of salts of magnesia and permanganic acid. The permanganate of lithia has lately been brought into use as a medicinal agent, and is said to be beneficial in cholera, diarrhœa, and allied states of the intestinal canal.
CHIRURGUS AND SUBSCRIBER.—We know of no specific. Try blistering.
A SUBSCRIBER.—The general redness of the skin, associated with paleness of particular parts, is not a certain sign that the circulation has continued after birth; a deep brownish red tinge being a characteristic appearance of the skin of a fœtus that has died within the womb. There is a distinction of colour that should be noted, and taken into account with other signs. A decisive opinion could not be given without a post-mortem examination.
L.S.A. The Bill has no such clauses; our correspondent need not be alarmed.
Mr. JOHN H.—We may probably advert to the subject.
Dr. HEARNE.—Received with thanks.
Dr. EVANS.—We have no means at hand enabling us to comply with your report.
LABOR OMNIA VINCIT is advised to communicate with the Secretary of the College of Physicians.
Dr. PARK'S interesting communication is inserted.
Mr. WAKE.—Received and inserted.

Messrs. Nicholson and Co.,

Wholesale Chemists, 5 Dean street, Oxford street, London. Sole Agents for KEITH and CO.'S CONCENTRATED ORGANIC REMEDIES; also, the New Work by GROVER COE., M.D., being a Practical Exposition of the Therapeutical Properties and Clinical Employment of these invaluable preparations.

Sole Original Makers of the LIQ. COPAIBÆ e BUCHU et CUBEBÆ, miscible with distilled water, clear and does not nauseate. LIQ. ANTIPSORIC, a perfect specific for Scabies, without any smell of sulphur. LIQ. ERGOTÆ never fails, and equal in strength to the powder. Ozonized Ol. Jecoris Opt., only 1s. 19d. per lb.

All the New Remedies, Concentrated Infusions, etc.

Piles and Prolapsus Ani.

The most eminent of the medical profession and thousands of persons afflicted with the above complaints can testify to the advantage of ATKINSON'S REGISTERED RECTUM SUPPORTER in the curative treatment of Piles and Prolapsus Ani during the last nine years. It never fails to give immediate relief, and can be worn under all circumstances. Price 42s., sent free on receipt of P.O. order, with circumference of body below the waist, to B. F. ATKINSON, 3 Hemming's row, Charing cross.

Chlorodyne.—R. Freeman,

Pharmaceutist, Kennington road, London, S., informs the Profession and Trade that he has FOR YEARS MADE, and extensively supplied Chlorodyne—in one-ounce and four-ounce stoppered bottles, at 1s. 6d. and 5s. each. He guarantees it to be uniformly and properly prepared, and superior to any other makers', though their charge be ever so exorbitant; and he is glad to find that the low price at which he sells it allows the Profession to use it in common practice and at public institutions, so that its extraordinary beneficial effects are enjoyed by the poorest sufferers. Sold by all Wholesale Druggists.

Labels Cut by Machinery.—

Adhesive for marking goods, 1s. per 1,000; Dispensing or Chemical, 2d. per 100, kept in stock; with Name and Address, 2s. per 1,000; Mixture, Pill, &c., equally moderate. An assortment of Labels for all trades. Contracts with large consumers.

J. CROSS, & SON, Engravers, Steam Machine Printers, Lithographers, and Stationers, 18 Holborn hill, E.C. Established 1813.

Bourchardat's Gluten Bread, Semola, and Chocolate,

for CONSUMPTION, DIABETES, and General Debility.

"In our experiments we found that 1½ oz. of gluten bread, when taken alone, increased the emission of carbonic acid to the maximum extent of 1·04 and 1·7 grs. per minute, and maintained the effect for fully three hours. 2 oz. of gluten bread taken in the morning caused an increase of 62 grs. of urea during the day. 1½ oz. of the best gluten chocolate caused an increase in the quantity of carbonic acid evolved of 2 grs. per minute, with the increase enduring for about three hours. . . . . In the treatment of consumptive patients we attach very great value to the use of these substances."—Page 248, "Consumption, its early and Remediable Stages," by Edward Smith, M.D., LL.B., F.R.S.

G. VAN ABBOTT & CO., Howford buildings, Fenchurch street, E.C.; and all Chemists.

BY ROYAL LETTERS PATENT.

MAW'S FOUNTAIN INFANTS' FEEDING BOTTLE.

SIMPLE IN CONSTRUCTION.

PERFECT IN ACTION.

MAW'S PATENT FOUNTAIN INFANTS' FEEDING BOTTLE is the only one in which a really successful attempt has ever been made, by a simple mechanical arrangement to supply the place of the natural breast.

This invention consists of a valve placed at A, allowing the food to flow from, but preventing its return into the bottle, the teat C is pierced with leech-bite holes, only opening on the application of pressure.

The great advantages derived from this arrangement are,—The tube and teat once full, the latter is emptied by pressure, and by virtue of its elasticity, coupled with the action of the valve at A, refils itself, so that the child obtains a supply of food by a combination of suction and pressure, in a manner identical with that of nature.

The effort of drawing up a long column of liquid to which many weakly children are unequal is altogether dispensed with.

The teat remaining closed until opened by the pressure of the child's gums in the intuitive act of feeding, the danger of a continued flow of food is perfectly guarded against, an advantage possessed by no other feeding bottle.

The tube and teat always remaining charged with food, precludes the possibility of air entering the stomach.

Price 2s. 6d., 5s., and 7s. 6d. each.

SPARE BOTTLES, TEATS, &c., SUPPLIED SEPARATELY.

Sold by all Chemists and Druggists, and by

S. MAW & SON, 11 ALDERSGATE STREET, LONDON.

BE CAREFUL TO SEE THAT THE NAME IS ON EACH BOTTLE.

ART. 6258.

MISCELLANEA.

— Dr. H. Roger has recently presented the *General Association* with a gift of 12*l.*

— Mr. Bretonneau's obsequies were celebrated at Tours, on the 7th of May, with a degree of solemnity suited to the reputation of that eminent practitioner, and to the importance of his native city. Several speeches were delivered on the occasion, by Messrs. Bouillaud, Velpeau, and Trousseau. Mr. Velpeau's address being more especially descriptive of the private character of the man, than of the well-known scientific labours of the late much esteemed professor, we are happy to be able to reproduce, for the benefit of our readers, the principal features of this animated sketch of the life of one, who may be justly termed the Medical *Lafontaine*.

" . . . . . To do Mr. Bretonneau full justice," said Mr. Velpeau, "he must not be measured by the standard of common men, nor his acts judged by conventional rules. He stands out alone, a strongly marked human impersonation, and neither thought, felt, nor acted like others. He life was singularly eccentric; he slept or watched at all hours, cold or heat were equally indifferent to him. Careless of time, place or subject, he willingly talked on all matters. I have seen him sleep while riding from Tours to Chenonceaux, without wavering in the saddle, or interrupting his conversation. While speaking with a patient, he would sometimes fall asleep in the middle of a phrase, but without losing the thread of his discourse, which he would resume without his temporary absence being noticed.

"His diet was most irregular; he would eat and drink whenever urged by appetite, at night as in the day, without bestowing a thought on the matter, or reference to the regular meal-hours of his family. All his acts were equally spontaneous, and displayed utter unconcern of the future. He had no fixed plan, no pre-arranged system. When any object interested him, he exclusively devoted himself to that alone, and nothing could divert his attention from his inquiry.

"When engaged in the study of diphtheria and typhoid, he would turn his back on any one who spoke to him on any other subject. If a stranger rang the bell, he would say 'Pray inquire, and if it is a case of sore-throat or fever, say I shall call, otherwise I am not to be seen.' On his return from hospital, if Mr. Bretonneau was permitted to set foot within his garden, his patients were at once and utterly forgotten. It was impossible to tear him away from his flowers, vines, or vegetables.

"One day while performing an operation for cataract, he was dissatisfied with the shafts of the needles. At once he suggested an alteration, which has since been adopted generally, and lest a workman should not fully enter into his idea, he fabricated the instruments himself, and for three days could not be dragged from the workshop. On another occasion, he invented tubes for the preservation of vaccine matter, and for entire days he worked with the enameller's lamp, and the blow-pipe, bending, melting, and remodelling glass, and, finally, producing capillary tubes, which have long been preferred to all others, but for this new pursuit he again abandoned his patients.

"It was of course next to impossible to get speech with a man of so eccentric a disposition, and yet his practice was most extensive. He was eagerly sought after by all the gentry of the whole country around, and of the neighbouring departments, and was often summmoned to Paris by persons anxious for his advice; never did a provincial practitioner extend his reputation over so wide a range. Each patient was for him *a fact* requiring elucidation. He visited him at all hours, uncalled, often or seldom, as he thought proper. He would watch the case for an hour, for half the day, or merely look in without any measurement of time, and personally superintended the punctual execution of his prescriptions, which he often administered himself.

"Whimsical, peremptory in his opinions, inimical to useless discussion, he was impatient of the conventional rules, which regulate professional intercourse. From absence of mind, he was most unpunctual in his appointments. One day three physicians expected him at the house of a patient; after waiting three quarters of an hour, they retired. He had passed an entire hour in the kitchen in high discussion with the cook, on the subject of some culinary preparation. A candidate to whom he was partial, once wrote to say that his well-known influence with the judges of a competition would be necessary. On the morrow he proceeded to Paris; but on leaving the railway-station, he fell in with professors of his acquaintance who enticed him into a discussion upon some arduous point of science, which required for its investigation visits to the museum, the botanical gardens, the College of France. In short, preoccupied with this new matter, he returned to Tours, without having even seen his friend or the judges, on whom depended the issue of the competition which had brought him to town. Instances of the kind abound in Bretonneau's life.

"The motive of his labours and researches was always different from that which actuates other men. It was neither vanity nor ambition, nor was it love of fame; his purpose was ever the discovery of the unknown. His sole ambition was the elucidation of abstract truth, freed from all doubts and obscurities; he pursued his object with extrordinary earnestness and perseverance. No obstacle could check him. During the epidemics of sore-throat and typhoid the practitioners of Tours, startled at his novel doctrines, asserted that cases differed in private and in hospital practice. To detect the cause of error, and undeceive them, one method only occurred to Bretonneau—viz., *post-mortem* examination. The families of the dead were unwilling to consent to the dissection of the bodies of their relations, and the other physicians were luke-warm in the cause. Autopsy, however, was necessary, and the question was sufficiently important to justify that measure. Body-snatching, a hazardous proceeding at all times, and forbidden by law, was, of course, impracticable by day, but at night, the authorities to whom the matter was hinted, might, in favour of the motive, wink at the illegality of the act. Every night, therefore, towards two o'clock, armed with ladders, we repaired to the cemeteries, and scaled the walls like malefactors. In the course of a few months, we thus effected thirty-six post-mortem examinations of persons who had died of diphtheria or dothinentery; we were often suspected and watched, twice we were fired at, and, an accomplice in these perilous expeditions, I was wounded in the leg, where I shall bear a lead-shot to my dying day. But the great object was attained, the scientific question received a satisfactory solution, and the disease was found to have produced exactly the same anatomical lesions in private practice as in hospital.

"Any one but Bretonneau would have taken advantage of his discoveries, and written to the journals, and to the Academies; this never occurred to him. He related his researches to every one, thoughtless of spoliation, and never attempted to publish. The few papers he consented to print were actually forced from him by my own and Mr. Trousseau's entreaties.

. . . . . .

"Bretonneau's was a bold and inquiring mind, a keen and deep intellect; as an observer, he was scrupulous, attentive, shrewd, and original to a fault. Whatever subject he approached, he sifted to the bottom; whatever he touched, he modified, improved, and completed. Were all his useful discoveries in medicine or in horticulture published, science would possess many volumes signed with his name.

"His intellectual powers were more marked by acumen than by extent; æsthetics, lofty philosophical views, abstract ideas, did not suit his taste. A man of placid judgment, he excelled in the investigation of facts; despite his natural circumspection, he yielded to the allurements of scientific

research, regardless of noisy discussion abroad, and heedless of popular prejudice or universally accepted opinions. His clear intellect, and amiable simplicity of manner, not incompatible with a considerable degree of sly and somewhat satirical humour, made him a charming and instructive companion. Whatever the subject of conversation, he was sure to start some new and quaint view in an unexpected manner.

"Surrounded by public esteem, sought after by all, Bretonneau would have realised a large and legitimate fortune, had he not thought as little of money as of fame. Bretonneau never once asked for payment, or stated the amount of a fee. His patients paid him or not, as suited them; he never attended to the matter. Important sums were, however, often handed to him, for all men are not ungrateful; but any one might take advantage of his temporary windfalls, he knew neither how to use nor how to protect his property. He lived from hand to mouth, and gave to whoever asked. . . . . .

Bretonneau is now an historical figure. Touraine is justly proud of having given birth to such a man, and of having to the end kept him in the midst of her children. Descartes, Rabelais, P. L. Courier, and others it is true, were also born in our beautiful Touraine; but, almost all these eminent men sought glory far away from their home, and the city of Tours has never possessed within its walls, a medical celebrity of equal eminence, or surrounded by so bright a halo as Bretonneau, who lived and died in his native city."

— The Medical Society of Bordeaux, proposes for competition two subjects, which are ushered in by the following preamble:

In many instances, an attentive observer may discern in pregnant women, certain physiological aptitudes or various general or local morbid conditions, which may give rise to, or promote the development, at a given time, of puerperal affections, such as fever, metritis, metro-peritonitis, eclampsy, apoplexy, paralysis, syncope, &c.

Without neglecting the important changes the nervous and circulating systems are liable to during utero-gestation, which may induce, under circumstances hitherto undetermined, the sudden cessation of life, the candidates are expected to inquire into the idiosyncrasies and morbid conditions above alluded to, as premonitory of puerperal symptoms; and to indicate the hygienic and therapeutic measures best calculated to modify them, and to treat fully:

"*Of the prophylactic and curative agents applicable during utero-gestation, and calculated to avert the occurrence of puerperal disease.*"

A gold medal, value 12*l.*, will be awarded to the author of the best memoir, at the annual public meeting of the Society, in 1862.

A gold medal of the same value will also be adjudged at the annual meeting of 1863, to the author of the best memoir on the following subject:

"*Analytical and Critical Study of the Numerous Publications on Typhoid Fever, Calculated to Facilitate the Appreciation of its Nature, Causes, and Treatment.*"

The papers, legibly written in the Latin, French, Italian, English, or German languages, to be forwarded (post-paid) to — Desgranges, M.D., Secretary-General of the Society, Rue St. Catherine, 25, Bordeaux, before the 15th of October, 1862.

— The Medical Society of Lyons offers for competition a sum of 12*l.* to the author of the best memoir on the subject of *Contagion*, and another prize of the same amount, for the best paper on *The Diseases Consequent on Habitation in Newly-constructed Houses.* Candidates for the latter prize must illustrate, by cases in point, the characters and direct causes of the affections induced by the agency alluded to. They are also expected to point out, with precision, the signs which show that a building may be occupied without danger, and, in case the present administrative regulations are declared to be insufficient, to draw up rules which may guide the authorities in the repression of abuses.

The memoirs must be forwarded before the 15th of August, 1863, to Dr. Diday, Secretary-General, at Lyons.

— The Minister of the Interior has appointed a committee to investigate the question of hospital architecture, and to present designs and models on the subject.

Mr. Parchappe, Inspector-General of Lunatic Asylums, is the only physician whose name appears in the list of members.

— Dr. Eissen expresses himself as follows in the *Gazette Médicale de Strasbourg*, with regard to the creation of the new Professorships at the School of Medicine of Paris.

"It will be obviously impossible to leave the provincial schools in a state of utter inferiority, and yet their suppression will be equally impossible, either at Montpellier or Strasburg. The latter Faculty is the nursery of the Medical Staff of our Army, and can neither be closed nor doomed to confer insufficient knowledge on its pupils, who, belonging to the army, are not at liberty to select other sources of instruction.

"It is, however, in some degree satisfactory to be able to proclaim, that histology has been taught at Strasburg, long before the official creation in Paris of a special chair devoted to this branch of science. For several years, Professor Küss has lectured on this important subject, and the researches of Messrs. Morel, Fellow of the Faculty, and of Staff-Surgeon Villemin, have not been unnoticed by the learned, and bear witness to the progress of histological studies at the School of Strasburg.

—The following is an extract from the *Presse Médicale Belge:*

"An English Medical periodical has recently adduced the singular fact that in the United Kingdom, in 1859, 422 soldiers out of every 1,000 were sent to hospital for syphilis. In the garrison of Paris, the proportion is 34, and at Brussels, 67 per 1,000. Thus, for one case of syphilis in the French army, we find two in Belgium, and twelve in England.

"We are ignorant of the source whence these figures are derived; Belgium is perhaps in Europe the country in which the most effective preventive measures have been adopted to arrest the dissemination of syphilis; and it is certainly in Belgium that the scourge is the least prevalent. The inaccuracy of the above statistics will be clearly apparent on the perusal of the tables published by Mr. Vleminckx, the Inspector-General of the Hospitals of the Belgian Army. This remarkable publication establishes, beyond contradiction, the fact that venereal disease is much less frequent in Belgium than in France; we say nothing of England, where no preventive measures are in vigour, and where the social evil is totally unrestricted. Syphilis is far more prevalent in Great Britain than it would appear even from the figures reproduced in the English journal referred to.

"We are in possession of documents which show that Italy is not more favourably situated than France or the other countries in which the Belgian regulations are unknown or neglected.

"Thus, at Rome, in 1858, the effective force consisted of 4,531 men, of whom 167, or 3·68 per cent. were admitted into hospital for venereal symptoms.

"In 1859, the effective troops numbered 5,924 men, 406 or 6·85 per cent. were affected with syphilis.

"In 1860, of 8,562 men, 747 or 8·72 were similarly diseased.

"These figures do not include the cases of urethritis or balanitis, treated in the regimental infirmaries; these may be estimated at 12·5 per cent. of the entire force; therefore, in 1859, 20 per cent. of the French army of occupation must have suffered from venereal symptoms, an unexpected result in the Eternal city.

"Turin is not circumstanced more favourably; in 1858, the last year of which statistics have reached us, the aggregate cases of venereal disease, including gonorrhœa, amount to 21 per cent. These figures will doubtless decrease under the influence of the sanitary measures adopted at the suggestion of Professor Spérino, who, during his residence at Brussels, had an opportunity of satisfying himself as to the efficacy of the regulations which protect our metropolis against the propagation of syphilis.

Obituary.—Mr. Loiseau, of Montmartre, well known for his researches on diphtheritic affections, and his successful prac-

tice in cases of croup, died a few days since, from the effects of erysipelas, consequent on pseudo-membranous angina; this disease had been communicated to Mr. Loiseau by a child, in whom he had recently performed tracheotomy. Mr. Loiseau is much regretted at Montmartre, where for the last twenty-five years he unremittingly attended to the duties of his profession.

Dr. Tessier, physician of the Hospital for Infancy, has also died in Paris. Mr. Tessier had for many years been a convert to homœopathic doctrines, which he defended with a considerable amount of talent in the *Art Médical*.

We have also to mourn the loss of Dr. Baumers, of Lyons; of Dr. Bachelier of Le Mans, and Dr. Jacotot, the son of the celebrated originator of the system of universal tuition.

Mr. Ludger-Lallemand, whose appointment as chief of the Medical Staff of the French expeditionary corps in Mexico, we recorded in our February number, has died a victim to yellow fever on the inhospitable shore of Vera Cruz.

The Medical Circular.

ON THE PROXIMATE CAUSE OF CONSUMPTION AND ITS SPECIFIC TREATMENT BY THE HYPOPHOSPHITES.

By J. FRANCIS CHURCHILL, M.D. (Paris).

No. XIII.

REPORTS OF CASES TREATED SUCCESSFULLY IN THE THIRD STAGE (THAT OF EXCAVATION). (c)

CASE XXIV.—PHTHISIS IN THE THIRD STAGE.

Previous duration.—One year.

Symptoms.—Disease not hereditary; weakness; emaciation; night-sweats; pains in the side; dyspnœa; cough; expectoration; hæmoptysis; amenorrhœa; leucorrhœa.

Lesion.—Excavation in the right, softened tubercles on the left lung.

Result of Treatment.—Persistence of signs of excavation; complete disappearance of the general symptoms and of the signs of lesion on the left side.

Duration of Treatment.—Three months and a half.

Stephanie B., æt. twenty-five, married, sempstress.

Aug. 11th, 1858.—The disease is not hereditary; it began about a year ago while pregnant; since then patient has lost much strength, and has grown very thin; she has neither fever nor rigors, but profuse night-sweats; complains of pains in the side, but finds no difficulty in lying down, and sleeps pretty well; has great dyspnœa; cough frequent; muco-purulent expectoration not very abundant; had a slight attack of hæmoptysis about a month ago, for the first time; appetite good; has no vomitings, and digests well; no epistaxis; never had diarrhœa, but suffered from colic the day before yesterday; catamenia have not appeared since her confinement in January last; now has abundant leucorrhœa; has not been able to work for three months past; pulse 120, regular.

Local signs.—In front percussion dulness below the right clavicle for about two fingers' breadth. On auscultation, on the left, rather rough respiration above and below the clavicle, with a few dry crepitus; resonance of voice and cough; on the right, above the clavicle, loud blowing respiration, with considerable resonance of voice and cough; below the clavicle, blowing respiration, with prolonged expiration, accompanied by moist crepitations; great resonance of voice and cough; in the rest of the lung, coarse respiration, with prolonged expiration; behind, on percussion, diminished resonance throughout the whole of the right side, especially marked in the fossa supra-spinata. On auscultation, on the left, in the fossa supra-spinata, coarse respiration, with dry crepitations greatly increased during cough; in the fossa infra-spinata, moist crepitation still more abundant, with increased resonance of voice and cough; at the base, coarse respiration; on the right, in the fossa supra-spinata, cavernous respiration; perfect pectoriloquy; in the intra-scapular region, small gurglings and pectoriloquy; moist crepitations in the upper two thirds of the lung; coarse respiration at base.

Diagnosis.—Softened tubercles in the left lung; excavation and softened tubercles in the right.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Aug. 18th.—She says the cough and expectoration are less; her strength is returning; feels rather less dyspnœa; her appetite continues good, but the night-sweats are still abundant; the catamenia have made their appearance for the first time for the last seven months, and lasted for five days. Pulse 88, regular, rather full.

Aug. 25th.—Her strength increases, and she has been able to resume working; appetite good, but the night-sweats still as abundant, and she also complains of headache; pulse 120.

Treatment.—Hypophosphites of soda, gr. iv., daily.

Sept. 1st.—Night-sweats have diminished; now only coughs a little in the morning; cephalgia has ceased; she has worked daily for the last week, without feeling fatigued; pulse 96, regular, rather full.

Treatment.—Hypophosphite of soda, gr. iij., daily.

Sep. 13th.—Cough has slightly increased of late; night-sweats have ceased; she is stronger, and has less dyspnœa; is expecting the catamenia; leucorrhœa less abundant; she continues to work; pulse 104.

Treatment.—Syrup of ipecacuanha, ʒij., a tablespoonful at a time.

Sept. 15th.—The night-sweats have not re-appeared, and she says she now feels no dyspnœa; pulse 96, regular, rather full.

Treatment.—Hypophosphite of soda, gr. v., daily.

Sept. 24th.—Scarcely coughs at all, and expectorates but little; says she has no dyspnœa, nor night-sweats; catamenia have appeared abundant, but it were accompanied with slight hæmoptysis, so that she has ceased working; leucorrhœa has decreased; pulse 88, regular and rather full.

Treatment.—Hypophosphite of soda, gr. iij., daily.

Oct. 6th.—Scarcely any cough or expectoration remaining; appetite good; leucorrhœa now very trifling; she works about six hours a day; pulse 88, regular, rather full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Oct. 22nd.—Patient says she is well, and now works ten hours a-day; pulse 76, regular, rather weak.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Nov. 3rd.—The improvement continues; patient can work without fatigue; pulse 96, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Nov. 15th.—Never coughs now she says, nor perspires at night; pulse 96.

On examination the following was noted:—In front, on percussion, marked dulness above the right clavicle. On auscultation on the left above the clavicle, blowing expiration, bronchopony, and resonance of cough; same signs below, but less marked and without the blowing. On the right, above the clavicle, same phenomena as on the left, but less marked. Below the clavicle, a few dry crepitus; no resonance of voice or cough; coarse respiration and prolonged expiration through nearly the whole extent of lung. Behind, on percussion, diminished resonance in the right fossa supra-spinata, still more marked in the intra-scapular region of the same side. On auscultation, on the left, in the fossa supra-spinata, coarse respiration without resonance of voice or cough; no râles or crepitus. On the right side, in the upper part of the intra-scapular region, cavernous respiration with pectoriloquy; no râles or crepitus of any kind. These signs are perceptible over an extent of about three fingers' breadth; below, coarse respiration and prolonged expiration without râles or crepitus.

Treatment.—Hypophosphite of soda, gr. viij., daily, after a suspension of five days.

Nov. 29th.—Has had her feet cold and has coughed more for some time, but within the last two days, the cough has almost ceased; still expectorates a little in the morning; catamenia now appear regularly, and she works ten hours a day; pulse 100, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Dec. 20th.—Catamenia have come well, and lasted for three days; her appetite is good, and strength still increasing; pulse 84, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

Jan. 30, 1859.—Scarcely any cough; appetite good; no night-sweats; is now quite strong and works all day; pulse 60, regular, rather weak.

Treatment.—Hypophosphite of soda, gr. viij., daily, after a suspension of eight days.

Feb. 9th.—Improvement still continues; no general symptoms left; can work ten or twelve hours a day; pulse 80, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., every other day.

March 7th.—Continues well, and is gaining flesh; pulse 96. The same treatment.

March 28th.—Same satisfactory state; pulse 96, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. v., every three days.

April 27th.—Is quite well, she says, and works all day; pulse 72, regular, moderately full.

Treatment.—Hypophosphite of soda, gr. viij., daily.

(c) Translated from the second edition of my work, 'De la Cause Immédiate de la Phthisie Pulmonaire.' In the Press.

May 30th.—Is going on quite well; pulse 96.
Treatment.—Hypophosphite of soda, gr. viij., every three days.
Oct. 3rd.—The improvement continues. No treatment.
Jan. 9th, 1860.—Going on well. Pulse regular, moderately full.
Treatment.—Hypophosphite of soda, gr. viij., once a week.
May 7th.—No general symptoms.
Treatment—Hypophosphite of soda, gr. iv., every six days.
Sept. 24th.—Has no cough, and says she is quite well.

Feb., 1861.—Has passed the late severe winter in perfect health. Is now seven months advanced in pregnancy, and there is every reason to believe that her confinement will be as favourable as in the normal state. She continues to take the hypophosphites in prophylactic doses.

The patient was confined of a healthy child in May, 1861, was able to get up a week after, and has continued ever since in perfect health, although working fifteen hours a day.

June 24th, 1861.—The following was noted on examination :—On the left side percussion and auscultation sounds, both normal before and behind. On the right, percussion, dulness above the clavicle, diminished resonance below with prolonged expiration, and increased resonance of voice and cough. Posteriorly, dulness on percussion in the fossæ spinatæ and in the inter-scapular space ; blowing respiration, with bronchophony no râles nor crepitas. The patient at this date (June, 1862) still continues to enjoy perfect health. She continues to take the hypophosphites occasionally, because she says she can not do the same amount of work without them.

I offer no comments upon the preceding cases. In my next paper I shall call attention to one or two of the principal features connected with their history.

(To be continued.)

ON THE TREATMENT OF SEVERE VOMITING WITH CREOSOTE.

Although it is not at all uncommon in private practice to find patients of tender years, and even those grown up, now and then affected from various causes with slight vomiting, unattended by any bad result, yet we also occasionally meet with cases of violent and severe vomiting arising from functional disturbance, or derangement of some portion of the mucous membrane of the alimentary canal, which, when severe and persistent, often brings on speedy prostration, cramp, &c., requiring no small skill and promptitude on the part of the physician, so as to avert untoward results, and quickly relieve them safely and successfully. The following cases of vomiting occurred in my practice, not very long ago due seemingly to irritant ingesta :

Case 1. Sept. 11, 1851.—Mrs. M., æt. thirty-four, the mother of a family (not pregnant at this time) was taken ill late at night with retching and vomiting shortly after retiring to bed. Ere long I was sent for, as she was much worse and I was told to come speedily. On seeing her, she was pale and weak ; there was no bowel complaint ; the floor in front of the bed and the smell showed clearly enough that she had, in a very short space of time, vomited a good deal. She had taken some flesh meat the day previous, and complained of a pain at her stomach afterwards, and more so during the vomiting. Made up for her presently, the following mixture :

℞ Creosoti ℥i. ;
Aquæ. ℥viij. Cap. coch. mag. om. hor.

She soon got relief by the mixture, and was up, though weak, and going about her household next day.

Case 2, Oct. 23rd, 1861.—Mrs. D., æt. thirty-seven, a pale thin person, in respectable station of life, and the mother of a family, the youngest four months old, which she was nursing herself, began, soon after having partaken of a fatty animal substance at supper-time, along with the rest of the family, to retch from time to time until vomiting commenced, and, it continuing to become more severe and persistent, a messenger was sent off with all haste and enjoined to bring me immediately as "the mistress was dying." On seeing her, she was still vomiting considerably a liquid of a watery appearance and sour smell, and had herself a cadaverous aspect with a very weak pulse ; complaining much of cramps in her legs ; in addition, great exhaustion had ensued, accompanied by a husky voice, and coldness of lower extremities, but no diarrhœa. From the painful and dangerous position the poor woman was in, evidently, I lost no time in applying every restorative within my reach to bring back heat to the feet and other parts requiring it ; and instantly gave her the creosote mixture myself, in tablespoonfuls every half-hour, until the vomiting abated a little, which it did very soon ; still she retched ; I persevered, however, in continuing the medicine in the same doses only every hour for sometime, and stopped as soon as she was out of danger. Ultimately with great care she made a good recovery.

Remarks :—Had there been cholera in the neighbourhood at the time, I could not easily have distinguished the above case of vomiting from being one ; and, although one prominent symptom, *viz.*, Diarrhœa, was wanting, still I think in all likelihood it would have soon shown itself if the case had not been attended to very promptly.

The undernoted cases of a whole family, more or less affected with severe vomiting were read before the Perthshire Medical Association during the present year.

May 17th, 1862.—J. W., æt. 50, himself and three of his family (two females and a boy), and a female relative, after having partaken together at their usual supper meal of tea and potted-head, which had been brought (cooked and ready) from a butcher's shop in a town about five miles off, the previous afternoon, were all simultaneously affected with retching and vomiting, which, continuing to get very severe, brought on alarming symptoms of exhaustion on two of them, and a neighbour was despatched instantly, about midnight, for me. The man on calling me up said to make haste, as "he feared some of them were dying." On arriving at the house, and then visiting each in their beds, their appearances were as follows :—The father's countenance was of a ghastly hue and anxious aspect, with very weak pulse ; and his youngest daughter who lay by his side, all but prostrate—she was about nine years of age. The next, a boy twelve years of age, considerably weakened ; an elder daughter also, but she stood it out much better, and was not so weak. The relative, an unmarried woman over forty years of age, suffered least. No diarrhœa in any, but only internal pain. Having with me, besides other remedial measures, a small quantity of creosote, I mixed two teaspoonfuls of it in a pint bottle of water, and administered it, in successive doses, instanter. Happily it had the desired effect, after several doses, in checking the vomiting, and the gastro-enteralgic pain. With due rest and careful dieting, which was enjoined, they were all able to be up, though the two worst were still weakly, and moving about the next and following day ; and on the third day afterwards were well again.

Remarks :—On enquiry, before I left the house, I was shown the remains of the potted-head in an ordinary broth or dinner plate. It appeared not to be new-made, and had an unusual colour and unpleasant though not fetid smell. The fleshy portions of the potted-head were tough and very adherent to the other solid parts, which were yellowish. I could not learn in what kind of a pot or pan, whether metal or copper, the potted head was prepared ; but, whether these symptoms were owing to diseased meat, or verdigris, the latter the more likely—is a question that I cannot decide. Here was a family all well up to the time of the sudden and violent vomiting consequent upon partaking of the "meat" with tea for supper. It occurs to me that such cases are worthy of being recorded, were it for no other good than in a medico-legal point of view.

Balbeggie, Perthshire, July 23, 1862.

RESTORATION OF AN AMPUTATED NOSE.

The following translation from an Italian newspaper, which I have just seen, will be read with interest by some of your readers, as exhibiting the readiness with which cuts unite if made by a sharp instrument, and quickly brought together :

A. C., a Milanese gentleman of undoubted courage, which he proved not only in the late war of Italian independence, but in various duels in which he was engaged, was insulted a short time back by a young Neapolitan officer, who was also well skilled in arms. A hostile meeting was agreed on. When they reached the ground the two combatants crossed swords, and, after a few passes, which they both dexterously parried, Signor A. C. slightly wounded his adversary in the left arm. Unfortunately, neither the wounded man nor the seconds took any notice of the accident. Signor A. C. was thrown off his guard by this occurrence, when the other, by an unexpected sword-cut, sliced off a large portion of his adversary's nose. At the sight of this wound the seconds interfered between the two combatants. Signor A. C., stooping down, picked up the piece of his nose which had fallen to the ground, and, presenting it to his opponent in a joking manner, said, 'I congratulate myself on the beautiful cut which you have given me. I ought to leave my nose with you as a trophy of honour ; but, if you are so good as to allow me the benefit of it for my life, I shall be very much obliged to you.' The young officer, full of wonder at this singular *sang froid*, seized his adversary's hand and squeezed it. A. C., then turning to the medical men, said, 'Gentlemen, put this tool in its proper place ; it is indispensable to my comfort, as I have contracted a habit of taking snuff.' The operation was performed on the spot and with the happiest results.

"JOHN GASON, M.D.

"Baqui de Lucca, July 16, 1862."

LECTURE ON OVARIOTOMY.

By T. Spencer Wells, Esq., F.R.C.S.

Last Monday I made some remarks upon other cases of ovariotomy which we have had here since the beginning of the year. The case which followed that of which I spoke last was a very remarkable one, especially interesting as to diagnosis. The patient was thirty-five years of age. She had been married four years, and had been quite well until May, 1861. About this time the catamenia became irregular, and the abdomen began to increase in size. Pregnancy was suspected, but she went into St. Bartholomew's Hospital early last January, and remained there a week under Dr. Greenhalgh, who gave a very decided opinion that she was suffering from ovarian disease. Others, however, having expressed a different opinion, she called on me on January 30. I found an abdominal tumour extending from the pubes to half way between the umbilicus and ensiform cartilage, reaching low down into the right flank, but on the left side the hand could be passed down between the tumour and the iloium. The tumour felt solid. I could detect no fluctuation either in or around it. It did not adhere to the parietes, and it was slightly movable from side to side. The sound of the aorta could be heard nearly all over it. Low down in the left flank there was an indistinct blowing sound. Nothing like the sound of the fœtal heart could be heard. A few papillæ were developed around the mammary areolæ, which were dark. On examining by the vagina I did not wonder at the suspicion of pregnacy, for the tumour felt exactly like the head of a child just above the brim of the pelvis, and on pressing it, it receded and returned; although this *ballottement* was not very well marked. On moving the tumour in the abdomen the movements of the tumour in the pelvis were felt to correspond in all directions, and the cervix uteri did not move with the tumour. The cervix was far back, large and soft, and the os seemed to be closed, so that I did not think it right to use the sound, especially as there were no urgent symptoms. I told the patient that I was disposed to agree with Dr. Greenhalgh, and believed that the tumour was ovarian; but that it would be desirable to wait for a time. A fortnight afterwards she went to a distinguished Physician-Accoucher, who saw her three times at intervals of a week, and came to the conclusion either that there was some abnormal form of pregnancy—tubular or instertitial—or a fibrous tumour of the uterus. The tumour increased slowly in size, and early in April the general health began to fail. She came in here for a few days towards the end of April. One of my colleagues thought the tumour was ovarian; another thought it was uterine—whether fœtal or fibroid he did not say. It felt extremely like a fœtus through the abdominal parietes, and the *ballottement* between the cervix uteri symphysis pubis was very suspicious; but then there were no fœtal movements to be detected (though the patient said she felt them), no sounds of fœtal heart, no placental souffle. As there was no fluctuation, and as the sounds of the aorta were transmitted, it was clear that the tumour was more or less solid; but still there was a certain evenness of surface (notwithstanding the irregularity), and an elasticity about it, which gave me more the idea of an ovarian than of a uterine tumour. She left the hospital, went to the country, and I saw her on her return in May. She was getting larger, losing appetite, breathing with difficulty, and losing sleep from pain. So she came into hospital again, and M. Nélaton joined our consultation on May 17. At this time a little ascitic fluid had collected, and it assisted greatly in the diagnosis, for it allowed the tumour to move much more freely, and we all became convinced then that the pelvic portion of the tumour was independent of the uterus. On placing a finger on the cervix uteri, and moving the tumour by pressure on the abdomen, the uterus was felt to remain unmoved, except when the tumour was pressed directly upon it. But on placing the finger anterior to the uturus, so as to feel the tumour through the upper wall of the vagina, every movement of the upper portion of the tumour was felt simultaneously in the lower portion. It therefore became quite clear that the uterus was behind the tumour, and that one could be moved independently of the other; but the question was still mooted whether the tumour was ovarian, or a fibroid outgrowth from the uterus. We decided to wait a little, and she went home; but as increase became more rapid, and the distress caused by the pressure greater, she was re-admitted for operation on June 2. There was then less ascitic fluid than when M. Nélaton saw her, but I suspected that there was some recent lymph present between the surface of the tumour and the abdominal parietes, as a soft crackling or rubbing could be both felt and heard. The upper border of the tumour could be felt reaching up to the ensiform cartilage, and here a yielding doughy sort of sensation on pressure led me to suspect the presence of a piece of adherent omentum. I felt quite satisfied, whatever the tumour might be, that its connexion with the uterus was sufficiently loose to admit of removal; although I *believed* it to be ovarian I was obliged to admit the possibility that it *might be* uterine, and therefore, to avoid all chance of misunderstanding, I wrote down the following diagnosis and showed it, before the operation, to the gentlemen present: "Either a semi-solid tumour of the right ovary, or a fibroid out-growth from the uterus, with some ascitic fluid on the surface, and a probability of adhesions on the left side between the tumour and intestine, and of omentum over the upper surface." I removed the tumour on June 5. M. Demarquay, of Paris, Mr. Hey, of Leeds, Dr. Aveling, of Sheffield, and several other friends were present. I first made an incision five inches long, from the umbilicus directly downwards, exposing the tumour and allowing some ascitic fluid to escape, with a good deal of gelatinous lymph. On making a puncture I found, as expected, that the tumour was nearly solid, and accordingly extended the incision upwards to four inches above the umbilicus. Then I separated a large piece of omentum which adhered to the upper surface, and attempted to withdraw the tumour. But I found that to do this without lessening its size would render an incision necessary from sternum to pubes, and I preferred the risk of breaking up the tumour. On doing this a quantity of pseudo-colloid matter escaped into the peritoneal cavity, and I was able to withdraw the tumour, and cut it away after securing the pedicle by a clamp. After thoroughly sponging out the peritoneal cavity the wound was closed as usual, keeping the clamp and pedicle fixed outside the lower angle of the wound.

I have really nothing to say of the after progress of the case, except that the patient got well without a check, and left the hospital three weeks after operation in good health, and I have heard that since her return from a country visit, she has remained perfectly well. . . . .

Whenever the pedicle was so long that the tied end could be kept outside without much pull upon the uterus, the rule has been that the patient has recovered quickly, giving us very little anxiety. But when the pedicle was so short that in order to keep the end outside, the uterus had to be pulled upwards towards the abdominal parietes, there was generally so much exhausting vomiting that I was led to consider the danger of leaving the sloughing end of the pedicle inside, as the lesser of two evils, and in some cases I left it in. But whether the patients recovered or not, they went through a very different course of symptoms after operation from those where the pedicle was long and its end was easily kept outside. In these latter everything generally went well from the first; the dead portion of pedicle beyond the grip of the clamp was removed on the day after operation, the clamp itself on the third, fourth, or fifth day; the portion of slough which had been enclosed between its blades separated a few days afterwards, and by the third week the patient was well. But when the ligature was inside we had a very different train of symptoms. Bilious vomiting and faintness; feeble, fluttering, rapid pulse; pallid, dusky skin; shallow, laboured respiration; and scanty ammoniacal urine, all pointed to poisoning of the blood by the absorption of some portion of the strangulated pedicle. We can see the effect of the ligature upon the pedicle when it is kept outside, and there is no good reason to believe that it can be very different when it is allowed to remain inside. Indeed, when the ligatures come away they generally draw with them just such shreds of black, fetid, dead tissue as we see separate outside. If the ligature be tied tight enough to stop bleeding and to prevent slipping of the pedicle, one can hardly see how strangulation and gangrene of the part of the pedicle between the ligature and the point where the pedicle has been divided can possibly be avoided, and the train of symptoms observed are precisely those which one would expect to follow putrid absorption. Accordingly, by this time last year I had almost determined never to leave the pedicle inside unless I was obliged. Sometimes it was fixed outside by the clamp, sometimes by ligature after removing the clamp, which was then simply used as a convenient mode of securing the vessels until the wound was closed. In a paper which I read at the meeting of the British Medical Association at Canterbury, last autumn, I suggested the following rules of practice:—

When the clamp does not drag on the peduncle too much, it may be left lying across the wound; but it will often be better to secure the pedicle permanently by ligature, and remove the clamp, which had been used to secure it temporarily. Close below the clamp, the peduncle is transfixed by a needle, which carries strong twine; and each ligature is so tied as to include a portion of peduncle of abont a finger's breadth. One general ligature is then tied tightly around the whole as a security against bleeding from any vessel which may have been punctured. The smaller the portion included in each ligature, and the tighter it is tied, the more rapid is the subsequent process of separation. When the ligatures have been securely applied, the clamp is removed, and any superfluous portion of cyst is cut away; but care must be taken to leave enough beyond the ligature to prevent any danger of this slipping off.

"When the peduncle is so long that the stump (or portion strangulated by the ligature) can be fixed outside the abdominal cavity, it is to be brought out at the lower part of the wound, and fixed there by a harelip pin, which is to be passed through it as well as through both edges of the wonnd. It is important that the ligature should be on a level wtth the skin, and that the stump should be surrounded by dressing which separates the sloughing tissue from the raw

surface. When the ligatures are fixed at the level of the peritoneum, raw surfaces surround the sloughing stump, and a sloughing condition of the wound, or putrid infection of the whole system, may possibly result.

"When the peduncle is so short that the stump cannot be brought to the surface without great traction upon the uterus, the common practice has been to bring the ligature through the wound, and fix the free ends securely outside. In one case, they were carried through the inguinal canal beside the round ligament, and the abdominal wound was closed. In another they were cut off short and left, the wound also being closed. It remains for further experience to determine which of these plans is to be preferred; or, if only the vessels should be tied, instead of the whole thickness of the pedicle; or if acupressure can be applied successfully; or if it would be safer to trust to the *écraseur*."

I afterwards became unwilling to delay the operation by this tying behind the clamp; and I also found that I had not overestimated the danger of allowing the stump to sink in between the lips of the wound. So I carried on the idea of the *écraseur*, but with the intention of leaving on the chain or rope for a few hours before completely dividing the pedicle. I had been the first to suggest the use of the *écraseur*, and I knew that it had been employed successfully in America by Dr. Atlee and others since 1858; but I never felt satisfied as to the security against secondary hæmorrhage during the straining of vomiting. So I had a wire-rope adapted to an *écraseur*, and so arranged that all except the cord and a screw to fix the wire after it was tightened could be removed. I then intended to tighten the wire after twelve or twenty-fours, and thus divide the pedicle with less fear of hæmorrhage. But the plan does not answer. It is very difficult to know the exact extent to which the screw should be tightened. If not tight enough, the pedicle may slip: and if too tight, the rope cuts. I have only used the chain *écraseur* itself once. It was on the 11th of last June. The patient was a young lady who was sent to me by Dr. West. Iodine had been injected, and one cyst seemed to have been obliterated by it; but others grew rapidly, and ovariotomy offered the only hope for her. I was assisted most ably at the operation by Dr. Savage, Mr. Pierce, of Notting hill, and Mr. Bateman, of Islington. The tumour was easily removed by the small incision; but there was literally no pedicle whatever. The tumour was closely connected to the right side of the uterus. The great bulk of the tumour consisted of very small cysts with very thin walls, but close to the uterus there was a fibrous mass as large as the fist, apparently contiguous with the uterine tissue. I was able to push the round ligament downwards, and to get the chain of an *écraseur* around this mass close to the side of the uterus; and as soon as the chain was tightened I cut the tumour away. It was clearly impossible so to draw up the *écraseur* as to keep the strangulated portion of tumour outside, so I gradually loosened the chain, intending to tie any bleeding vessel, cut off the ligature short, and return the uterus. But after the chain was loosened and taken away, there was not the slightest bleeding. We even applied warm sponges, to encourage some, rather than run any risk of after bleeding; but the vessels seemed to have been completely occluded by the pressure of the chain; so I allowed the uterus to sink to its natural position, and closed the wound entirely. There was some troublesome vomiting for two days after the operation; but the patient recovered so well that she went into the country on the nineteenth day. Dr. Tyler Smith has adopted the novel plan of dividing the pedicle close to the ligature, cutting away the ends of the ligature, and then returning the stump still enclosed in the ligature into the abdomen, and closing the wound. His experience so far has been favourable; but I must confess that I am not yet disposed to follow his example. I do not like the idea of enclosing within the body a portion of tissue which must be killed by the tight ligature left with it. I do not understand what becomes of either slough or ligature. I know of no experiment yet made on animals which can help us to understand it. So that for the present I prefer trusting to the clamp when the pedicle is long; and when it is short either tying the vessels only (not the pedicle), or using the *écraseur*, or applying acupressure, as recommended by Dr. Simpson, of Edinburgh, or the 'wire-compress' of Mr. Dix, of Hull, which may be considered as a modification of acupressure. No account of the cases in which acupressure was used have been published; but I have heard a vague statement that all the three cases in which it was employed in Edinburgh died of hæmorrhage. This is probably incorrect, and only shows how important it is to publish full reports of cases to prevent the circulation of mistaken rumours. However, I may say that, although I have been often prepared to use the needles as proposed by Dr. Simpson, I have never met with a case where I thought I could use them with safety. Mr. Dix's plan seems more likely to be generally useful. You may find an able paper by this excellent Surgeon, 'On the Advantages of Acupressure over the Ligature,' in the 'Medical Times and Gazette' of June 2, 1860, in which his plan is fully described. It consists simply in passing a piece of wire through the skin beneath the bleeding vessel, and out again through the skin on the other side of the vessel, and then twisting the two ends of the wire, tight enough to stop bleeding, over a piece of cork. After twelve, twenty-four, or forty-eight hours, the wire is cut and withdrawn. There has never been any hæmorrhage in any case where Mr. Dix has tied his plan, and he has used it in three amputations, including one of the thigh. It would be very easy to enclose the entire pedicle of an ovarian tumour in this way, or only the vessels; and if an experiment or two I mean to make on some pigs should succeed, I shall certainly—in some case of short pedicle—give you an opportunity of estimating its utility in ovariotomy.

I may say that the girl last operated on was my 40th case of ovariotomy. If she recovers, which I have no doubt she will, it will give a result of 24 recoveries to 16 deaths,—a proportion exactly of 2 recoveries to 3 operations.—'Medical Times and Gazette.'

EXTRACTS FROM ADDRESSES

DELIVERED AT THE

MEETINGS OF BRANCHES OF THE BRITISH MEDICAL ASSOCIATION.

BIRMINGHAM AND MIDLAND COUNTIES BRANCH.

PRESIDENT'S ADDRESS.

It has been stated by a recent Medical writer, that Medical science requires precision and exactitude, and that, unlike the physical sciences, it has no primitive law. There have been those who have endeavoured to establish a law—a primitive law—which should give exactitude to vital phenomena, and with what effect? Not to the enlargement of the domain of the science, but to its degradation and their own ruin. Solidists, humoralists, and vitalists, have had their day, and have passed away. The maxim with others has been "exact imitation" and attention to certain technical laws; and by their theories and practice they have mechanised the Profession, and destroyed the principles of Medical science, whilst they have contracted and given a fixedness to those laws, which must have the widest interpretation. Precision and exactitude cannot be given to phenomena accompanied by circumstances so complicated in their nature, and fluctuating in their operation, as to set at defiance every attempt to exclude their presence, or to neutralise their influence, or to appreciate and allow for the extent of their operation. The destructive agencies of prominent and false doctrines have thus retarded Medical progress. The history of the past gives us examples of wisdom, and enables us to draw lessons of wisdom from its errors. We find that pathology was false, and views taken of the nature of disease were necessarily crude. Treatment was empirical, because it had no scientific basis; but there were men of learning and genius, whose merits have ensured to their names and memories honours more glorious and more lasting than the highest titles which any hereditary or heraldic claims can boast. How difficult is the task to speak in terms adequate to their claims on our admiration and esteem! Our respect is shown for them, not by erecting monuments to their memories, but by reverencing and cherishing the works which they have left behind them; their good works will live for ever, and will for ever furnish examples for reflection, and subjects for honourable distinction.

There are certain reciprocal duties to be exchanged between the living and the dead. There are those amongst us equally deserving our admiration with those who have gone before; links in the great chain between the recorded past and the unknown future; men whose genius and labours stand displayed to us in all their glory, each adding, in his own way, his fruitful productions, to the progress and perfecting of the healing art. We, as we live and work, are to think of those who will come after us, that what we do may be serviceable to them as well as to ourselves; and when we die those who shall succeed us will accept the works accomplished in our day with thanks and remembrance. Each generation is thus fulfilling its duties to *its* past, *its* present, and *its* future; and every practitioner joining heartily in the practice of his profession, should have a persuasion of its perpetuity and of its progression towards a better excellence. It will not then remain to be regretted that we have not a primitive fact. It is a poor art or science which is soon mastered; and the advantage of a true pursuit is, that it never ends. It should be our happiness that art is long—life short; for surely we would not wish the pursuit of knowledge to end before life, nor with it; we might rather indulge the belief that whatsoever is good will never end. New fields for research are opening before us continually, new acquirements are being daily recorded, old hypotheses and theories are rapidly undergoing modification, or giving place to other and more correct ones; and thus we believe that the science of medicine, in preparing itself for generations to come, by storing up the wisdom bequeathed by its ancestors, and accumulating the treasure of its more recent acquirements, is preparing for itself that precision and exactitude which alike dis-

tinguish physical science. It is the belief in the accumulation of knowledge, not merely in the superseding of it, that gives perpetuity to study, adds to the dignity of our calling, and gives us pleasure in the right administration of the produce of our labours.

. . . . . .

It is a matter for congratulation that a higher status has been fixed for general and classical acquirements. The deficiency of early training in those destined for the medical profession has been a great hindrance to its social advancement. In the address delivered to you last year, Dr. Fletcher justified and recommended an apprenticeship of shorter duration than the old term of five years. I fully agree with all that was then said, and it was with some surprise that I found in the leading article of last week's 'journal,' "On the Medical Council and the College of Surgeons," the narrow views which the writer had taken of the utility of apprenticeship. He says: "The effect of the permission granted by the Royal College of Surgeons, is virtually to reduce further the minimum amount of education demanded by the Medical Council. Candidates for the college diploma may throw away a year or more of their time in blundering up to some amount of empirical knowledge." Like Dr. Fletcher, I went through the long term of apprenticeship; and I would ask permission to state some other advantages which may be derived from servitude. A student during his pupilage should become thoroughly acquainted with botany—should have made most of the pharmacopœal preparations—should have acquired the principles of chemistry, and so thoroughly have learned the bones as to be ready at once to commence dissections, in order to give him more time for the bedside and clinical instructions, and to enable him to gain greater practical knowledge than can be acquired by those students who have not undergone the same preliminary discipline. It is not true, then, that apprenticeship merely gives empirical knowledge; and I concur with our late worthy president, that whilst we have gained much, we have lost something—lost the steady application of the youthful student, which the surveillance of a strict and honest master *can* and *ought* to enforce.

The defectiveness of education, and the minimum of acquirements, does not depend upon the years of apprenticeship: the general acquirements must be tested to prove that candidates for the profession possess an organisation suitable for gradual improvement. They must possess senses to perceive, and minds capable of being informed, and desires which shall lead them, not to the passing of this or that examination as the goal of their ambition, but to some nobler end—to the earnest endeavour to possess that which has been acquired and can be imparted by their teachers, and desires which will not leave them content with possession, but will ever be urging them on to the acquisition of greater wisdom. Early training and good school education must be the foundation for that secondary and scientific education which is to be perfected by medical schools according to the regulations of chartered colleges or medical councils.—H. Duncalfe, M.R.C.S.

SOUTH MIDLAND BRANCH.

PRESIDENT'S ADDRESS.

In regard to the vagueness and uncertainty of physic, in its principles as well as its practice, may it not be said that all the maxims and practical operations of human life lie open to the same objection. They all consist of facts and principles which do not admit of mathematical precision; being made up of averages and approximations, all liable in various degrees to error and exception.

Now, without denying the existence of much humiliating truth in some of these sarcasms, which demands our serious consideration, we may fearlessly assert, in spite of all this conventional irony of men who would not hesitate to avail themselves of the aid of the art they so flippantly deride, that no class of men has exerted itself more disinterestedly in practical philanthropy than have physicians and surgeons, who may truly boast that science is their only means to assuage human suffering in all its forms. And those must indeed be morbidly sceptical, who will deny that the superior health and extension of life in this age and country, are in great part imputable to the improved state of medicine. It can be maintained that medicine has made corresponding progress with the rapid advance which has taken place in general knowledge. More progress has been made, more real facts obtained, more sound opinions formed in medicines calculated to alleviate human suffering and remove disease, during the present half century than in any preceding period.

Our knowledge is more exact; our practice more simple, more precise. Those of us who remember the introduction of the stethoscope, must admit the previous difficulty in the diagnosis of most thoracic diseases as compared with the present consequent facility and precision. How much, also, has our knowledge been advanced by the aid of the microscope and animal chemistry, is told by the advance made in the diagnosis and treatment of renal and other diseases. Have we not more definite and exact knowledge of the diagnosis of fevers leading to more correct treatment? Has not our knowledge of the physiology of the brain and spinal cord led to a more ready and correct diagnosis of the pathology of these organs? And, are we not now in the possession of the discovery of new and serious diseases? Are we not entitled to claim credit for the benefits, present and prospective, which the profession has and will have conferred on mankind by the really new science of preventive medicine; benefits, forced as they really have been on a reluctant public by the untiring zeal and great ability of philanthropic members of our profession?

Surgery has made equal progress. Medicine and surgery have been reciprocally benefited by similar labours.

Who can deny the glory of the discovery, and the inestimable value of the application of anæsthetics in medicine and surgery?

By an altered method of study, by more exact and more numerous observations, more cautious inductions, tested and checked by more numerous and more acute observers, have these great advantages been obtained.

Our knowledge of what we do know and can perform is more exact, and we have a more distinct view of what we do not know and cannot accomplish. For, in the words of one of the most classical and sagacious of medical writers (Dr. John Reid—*Essays on Hypochondriasis*), "In the degree in which our knowledge advances, we increase likewise our acquaintance with its comparative deficiency. As the circle of intellectual light expands, it widens proportionately the circumference of apparent darkness."

And if not *proportionately*, has not our knowledge of therapeutics been greatly augmented and much advanced? Is not our treatment of disease more simple, more rational, more exact, more conservative? Apart from the difference of treatment necessarily resulting from the generally admitted altered type of most diseases, how great is the change and how much is the improvement in many important particulars?

I well remember the time when hospital physicians and surgeons of eminence bled largely for delirium tremens; apoplectic and epileptic seizures were attacked with large and repeated bleedings; and, when pain was deemed the exponent of inflammation and treated accordingly; I have often seen inveterate hysteria, variously seated, go the round of the metropolitan hospitals, successively and, of course, fruitlessly assailed by bleeding, cupping, and blisters.

At that period, the elegant writer just quoted, who was far in advance of his contemporaries in diagnosis and treatment, exclaims "At the sight of a patient *in any kind of fits* the surgeon almost instinctively pulls out his lancet. Sometimes even after the paroxysm has subsided bleeding is had recourse to, from a vague and empirical notion of its indiscriminate utility in this class of diseases. Less slaughter, I am convinced, has been effected by the sword than by the lancet—that minute instrument of mighty mischief!"

The same author, in allusion to the then prevalent hepatic pathology and mercurial therapeutics, remarks: "There is reason to believe that many a patient, supposed to be hepatic, but in fact only dyspeptic, has fallen a martyr to a mercurial course; a course which has often been persisted in with a perseverance undaunted by the glaring depredation which it produced."

In those heroic times, when bloodletting and calomel bore sway, it was too often forgotten, or not sufficiently regarded, that, "in too rudely eradicating a disease, there is danger lest we tear up the constitution along with it." The sarcastic admonition of the poet (Quarles) of the sixteenth century was not less applicable in the nineteenth—

> "Hold thy hand, health's dear maintainer,
> Life perchance may burn the stronger;
> Having substance to maintain her,
> She untouch'd may last the longer.
> When the artist goes about
> To redress her flame, I doubt,
> Oftentimes he snuffs it out."

But the former abuse of the lancet has probably led to its present unmerited disuse. Had the valuable observations and sound directions of that late eminent physiologist and practical physician, Dr. Marshall Hall, in his admirable work on the *Morbid and Curative Effects of the Loss of Blood*, been more attentively studied, less of its former abuse and present disuse would have occurred.—Mr. Robert Ceely.

House of Commons, July 14th.—Mr. M. Smith moved amendments of the third clause of the Lunacy Regulation Bill, with the view of excluding two restrictions: one limiting the inquiry in lunacy cases to two years from its date; the other declaring that the opinion of any medical practitioner shall not be admissible as evidence of the insanity of the party. After much discussion, the former amendment was negatived, upon a division, by 86 to 50; the latter was carried by 72 to 53. The seventh clause, relative to the employment of short-hand writers, was negatived. The remaining clauses and certain new ones were agreed to.

Removal of Mrs. Vyse from Newgate.—The unhappy lady Mrs. Vyse, acquitted of the murder of her two children at the last sittings of the Central Criminal Court on the ground of insanity, and who was ordered by the judge to be detained during her Majesty's pleasure, has, by order of the Home Secretary, been removed from the jail of Newgate to Bethlem Hospital, St. George's fields, Lambeth, where she will be kept as a criminal lunatic for the remainder of her days.

THE MEDICAL CIRCULAR.

WEDNESDAY, JULY 30, 1862.

THE BRITISH MEDICAL ASSOCIATION.

On the fifth of next month, the Members of the British Medical Association will flock to the Metropolis from all parts of England, to celebrate the Thirtieth Anniversary of the Society. No doubt they have many causes of congratulation; the weather is warm and sunshiny, there are no epidemics to make them unhappy about their practices, the Exhibition is open and full of wonders, the Metropolis itself is one huge wonder, which everybody likes to look upon two or three times in his life, their own individual health is remarkably good, and their spirits cheerful, the Society has no funds in hand to appropriate to any useful purpose, so that the possibility of a financial dispute is foreclosed, and it has a very bad journal, which everybody is at last convinced it is impracticable to make better. How is it possible for people to be otherwise than happy under these circumstances? When a man is at the top or at the bottom of the wheel, he rarely makes much complaint. It is the transition state from affluence to ruin, or the reverse, that sounds the depths of a man's nature, and agonises him with horrible forecastings of misfortune. When he knows absolutely that he has not a shilling in his pocket, nor a friend to lend him one, he resigns himself to his fate, and looks contentedly around him to find somebody as abject as himself. It is certain he cannot be worse, and may possibly be better off, and thus there is ample room for hope and congratulation.

The British Medical Association is nearly in this situation. A few years ago it levied contributions upon its members to extricate itself from debt, and, we believe, succeeded; but the release was temporary; and at the present moment, though not actually indebted beyond its means of liquidation, it is nevertheless so poor as not to have any margin of income for application to any useful purpose.

How does it happen that an Association with an income exceeding 2,500*l.* per annum, is in such a helpless condition? Why is it that an Association boastfully styling itself "British Medical," is really incapable of promoting Medical science, or of exercising a beneficial influence over Medical affairs. Why is it that the "British Medical Association" is utterly unknown beyond the limits of this kingdom, and excites no interest among the Profession in this country, unless they happen to be members. Could it be conceived possible beforehand, that any society having so large an income to expend, could by any method of mismanagement, so dispose of its funds as to fail to command the respect and admiration of the Profession? Yet this Association, by the operation of a perverse ingenuity, or rather, perhaps, we should say, from the want of any ingenuity at at all—has succeeded in thus effacing itself from the roll of scientific and popular bodies. It is simply a club on a large scale; and its principal business is the preparation and discussion of—a good dinner. But the Society is not extravagant even in this particular, for no man is permitted to eat the dinner unless he pays for it an additional guinea; that is to say, his single dinner costs him as much as his annual subscription to the Society. But what becomes of his subscription? The Society has a Charitable Fund, you say. Exactly so; but there is a separate subscription for that also. The Society itself cannot afford to be charitable; it is too poor. Then it expends a thousand pounds a-year upon commissions to investigate difficult problems in Medicine, Surgery, Therapeutics, Topography, Meteorology, &c.? No. Then it is collecting specimens in Natural Science, or purchasing books that it may be enabled to establish a Museum and Library in each Medical School in the Provinces? No. Then it publishes a series of "Transactions" richly illustrated on a large scale, and in the highest style of art, of which it and England may be proud? No. Then it awards valuable prizes for the most important experimental and clinical researches in Physiology, Pathology, and Therapeutics? No. Then it has organised a central Board for the reception of returns of sickness, operations, methods of treatment, and mortality, from all the hospitals of England which it collates, tabulates, and summarises, publishing the results for the benefit of Medical Science? No. Then it endows scholarships in the various Metropolitan and Provincial Schools for distribution among the most promising candidates, being sons of Medical Practitioners? No. You can't guess; you had better give it up. It publishes a Journal—and such a Journal!

This journal is professedly maintained by the Association for the purpose of having a medium of communication between the members, and of publishing all intelligence that may be sent to it relating to the Association's business. The latter is its most important function, and that our readers may be able to estimate it correctly, we inform them that the Association intelligence, as published in the journal, would not occupy more each week than four columns of the MEDICAL CIRCULAR! Is it becoming, is it just, that the Association should expend 2,520*l.* per annum for such a paltry purpose? Is not this a tremendous price to pay for the accommodation?

If the Association should think fit to publish their intelligence in the MEDICAL CIRCULAR, we could meet their views upon conditions that would enable them to apply one-half of their income to some of the numerous purposes to which we have already alluded. We are merely suggesting what might be done, if the Association were a reasonable body of men, and had an earnest feeling for the advancement of Medical Science.

We refrain from doing the Association the service of criticising the writing and management of their journal, for it is no part of our duty to make the print any better than it is. There is, moreover, a very general conviction of its shortcomings, which will in due season make itself felt without any prompting. All we consider it necessary to add is, that the Association has had noble opportunities which it has heedlessly wasted, and with a superlative profligacy has lavished its treasure upon a journal of which, either as literary or scientific men, they ought to be ashamed.

THE PROSPECTS OF THE POOR-LAW MEDICAL OFFICERS.

A Bill has been introduced to Parliament by the Hon. W. Villiers, of considerable though indirect importance to the Poor-law Medical Officers. The purport of this Bill is to throw upon all the parishes of any Union any excess of expenditure beyond two-thirds over its ordinary expenditure, which may be incurred by any one parish; and, again, in the event of any particular Union being required to expend more than two-thirds in excess of its average expenditure, all the other Unions in the county may be required by an Order in Council to contribute their quotas to meet such excess of expenditure. This is obviously the first step, and a large one,

too, towards a county rating. Should this Bill become law, the principle of an equalisation of rating will be established. The present system is full of injustice in all its relations, and particularly so, as all our readers know, and some feel, in connection with Poor-law Medical Duty. We are, therefore, glad that the Government has determined upon asking the consent of Parliament to a measure that introduces a wedge that will break up, sooner or later, the existing system. We have

We have expressed the opinion in this journal that the best chance of the Poor-law Medical Officers obtaining a recognition of their claims, would be in connection with a general scheme for the equalisation of the Poor-rate. It would be premature at the present moment to urge their case; it is better that the Government should fight the battle of equalisation upon the basis of their general measure untrammelled by subordinate complications; nevertheless we have no doubt that the anomalies in the condition of the Poor-law Medical Officers have occupied the thoughts of the responsible Officers of the Board. Should this Bill pass, the case of the Poor-law Surgeons will have acquired increased strength.

It is probable that an opposition will be made to the Bill in Parliament on principle, and that there will be an attempt to tide over the present distress in the manufacturing districts by a national vote in aid of the suffering parishes. Should this attempt be successful, it would tend to damage the cause of the Poor-law Medical Officers, as it would be many years before the Poor-law Board would venture to equalise the salaries of the Union Surgeons in the face of a condemnation of the principle by the House of Commons. We, therefore, hope that the Government scheme will be carried. We have taken a humble part in helping the cause of "Poor-Rate Equalisation;" and it is not without satisfaction that we see the justice of the principle thus recognised by the Government. Let the Union Surgeons clearly understand that any amelioration of their grievances is closely associated with the success of the new measure.

SUMMARY OF THE WEEK.

ST. THOMAS'S HOSPITAL.

The works for the conversion of the Surrey Music Hall into a Hospital are in rapid progress. All the patients of the old Institution have been provided for in other Hospitals, Guy's and St. Bartholomew's receiving the last complement in the course of the week. The Surrey Gardens are only a temporary abiding place, though the best that could be selected for the purpose on the emergency.

THE COLLEGE CONVERSAZIONE.

Great interest is beginning to be felt in the *Conversazione* that is announced to be held at the College of Surgeons. This is another agreeable evidence of the determination of the Council to identify themselves more intimately with the members. A grumbling contemporary is dissatisfied with the Council, because they did not issue embossed tickets of admission to each member, and labours hard to lift to the surface some ponderous jokes, which have, however, a singular "alacrity at sinking." We will not quarrel with the Council for the course they have taken. Only let it be understood that they will give a *Conversazione once a year*, and that all the members are welcome, we do not think that anybody will find fault with the arrangements, except, perhaps, our discontented contemporary, whose susceptible dermal envelope might be gratified with a little shampooing.

THE LATE MR. PUCKETT.

The man Cox who murdered Mr, Puckett, has been tried for the crime and acquitted on the ground of lunacy. We advert to the subject to keep the attention of our readers to the fact, that a fund is forming on behalf of the late Mr. Puckett's family. If five shillings only were contributed by each Union Surgeon, a considerable sum would be raised. This is a case strongly deserving the consideration of the subscribers to the Medical Benevolent College.

MEDICAL REFORM AND THE MEDICAL COUNCIL.

The 'Lancet' has recently contained elaborate articles on a very simple matter—viz., an alteration proposed by the Medical Council in the Medical Act, for the purpose of increasing the stringency of the clause that forbids the use of Medical titles. One section of the Profession desires that the provision should be made operative only against unregistered and unqualified pretenders, who should be rigorously prohibited from using any title implying that they were duly qualified Medical practitioners. There is another section of the Profession that wishes to extend the penalties of the enactment against all registered practitioners who may use a title to which they cannot prove a strict legal right,—thus against a licentiate of a College of Physicians who calls himself "Doctor," or a licentiate of the Hall who calls himself "Surgeon." The "Medical Council" has been gradually inclining to the latter opinion, and its last resolution on the subject very distinctly affirmed the proposition, although it was so obscurely worded, that it would leave as many anomalies as it professed to redress.

We are opposed to over-legislation in the matter of titles. The public now thoroughly understand that a man may be an M.D. without being a practising Physician; and they do not care to know whether a practitioner who styles himself "Doctor" be a University graduate, or a Licentiate of a College of Physicians. It is probable that if any benevolent person should attempt to enlighten the ignorance of his friend upon so abstruse a question, he would only succeed in increasing his perplexity. Every Fellow and Member of the College of Surgeons styles himself Surgeon; yet the public suffer no deception; and if a man wants a second opinion, he does not apply to Mr. Smith, who keeps an open surgery in the adjoining street, but goes at once to Ferguson or Skey. Our readers may be quite sure that, should the Medical Council attempt to obtain legislation upon this subject, we should watch their proposition very narrowly, and we have not the slightest fear that they would succeed in passing any clause through Parliament that would excite much discontent in the Profession. It is best *quieta non movere*. The clause is imperfect as it stands, and gives the Profession little or no protection against quacks; but it is doubtful whether Parliament would increase its stringency in this respect. Most assuredly, the Profession would not like to see the experiment tried with the insidious design, and possible result, of forging new fetters for registered Practitioners. All existing anomalies will wear down in time. There is no wisdom in being impatient.

THE HERDMAN CASE.

A man of the name of Herdman has been recently tried at Belfast for murder, and as the evidence as to his lunacy was peculiar, we advert to the case. Herdman was stated, when young, to have been eccentric; he was fond of blowing horns and beating drums, wearing false noses, and masks in the streets, and carrying a broomstick in lieu of

walking cane. He was also in the habit of carrying fire-arms, and wore a coat of mail under his dress. He would spend all his money and then threaten to blow his brains out. He would hire a car, and himself drive it, with the natural consequence of getting into trouble with the police. So far these incidents evince nothing but the wildness and freakishness of youth. Hundreds of young men, by no means insane, have worn false noses, driven hack cabs wildly through the streets, and having spent all their money, have threatened to blow out their brains as a suitable remedy for their extravagance. Two learned Thebans gave their testimony, one—Mr. John Thompson, proprietor of the 'Armagh Guardian,' thought him "singular," that he had a "peculiar eye" and was "wild-looking;" the other, Mr. Richard Lilburn, Editor of the same journal, deposed that he was continually taunting the witness for being too tame in whatever he wrote;" this is not, we should imagine, a "singular" evidence of insanity as coming from a reader of the 'Armagh Guardian;" and again that "he was continually boring him with doggrel poetry." We can heartily sympathise with this persecuted editor, and have often involuntarily condemned to irremediable lunacy such unreasonable correspondents; but then all men are not editors. His sister-in-law proved that several members of the family had manifested evidences of insanity,—a father had hanged himself, a sister drowned herself, another was silly, and her mother was very eccentric in her dress, piling up a pyramid of eight or ten caps on her head, and two bonnets when she went out. On the whole, therefore, the evidence of lunacy was strong. Dr. Samuel Browne, however, took an opposite view of the case, and was decidedly of opinion that the prisoner was sane. This shows the difficulty of forming a satisfactory opinion in these criminal cases. We think, however, that the jury took a right course in bringing in a verdict of guilty, with an unanimous recommendation to mercy, on the ground of his eccentricities.

REVIEW OF THE PERIODICALS.

The 'American Medical Times,' (May 31). Dr. JACOBI on *Dentition and its Derangements* supplies a short but good practical lecture. In a translation of a lecture on the *Surgical Service of the Navy in times of War*, by Dr. JULES ROCHARD, we find the following observations:—

"As a general rule, complicated fractures seldom call for the sacrifice of the limb. In marine arsenals, where the larger part of the work requires the employment of many men when enormous masses are being continually moved, these accidents form the larger part of the hospital duties. Experience has taught us to rely upon the strength of nature and the efficacy of continued irrigation. To necessitate amputation, the destruction of the skin, the *abrasion* of the muscles, the crushing of the bones must be extreme, and they must be accompanied by the wounding of the principal blood-vessels. Such wounds will, without doubt, take a long time to cure. For instance, in fractures of the leg, it will often be six months and even more before the patient can walk; and even then when he leaves the hospital, in looking at the deformed limb, which swells and changes color after being for a few hours in a vertical position, we ask ourselves if we have done a real service to the patient, and whether it would not have been preferable to have saved him so much suffering, and have amputated at once. Months, and often years, are necessary to judge of the results. We can then see unhoped-for transformation. The bony soldering has diminished in size, the muscles have regained their shape and strength; the articulations, stiffened by a long disease, have recovered by exercise their movements. The limb cannot be recognised, the patient has forgotten his suffering, and the surgeon congratulates himself on his forbearance. To sum up, when the wounded can be properly attended to, *abstinence* should be the rule, and amputation the exception, in cases of complicated fractures.

"The same rule does not hold good in gunshot wounds. When ball strikes a long bone it splits as well as breaks it. A large number of pointed splinters enter the flesh and produce interminable abscesses and suppuration. Often the unseen cracks extend to the neighbouring articulations, full access is given to the air, and often pieces of clothing and the ball remain in the wound. These disorders are always more extensive than an external examination would lead us to suppose. Surgeons appearing for the first time in the field are often led into a fatal sense of security. Those who have had much experience insist on the seriousness of these wounds; and of the necessity of immediate amputation in most cases. Such was the practice of the leading surgeons in the wars of the Consulate and the Empire. When a long peace had made us forget the precepts of experience, the hospital surgeons denounced this as *wholesale surgery*. The contrary doctrines took root little by little in the schools, and when war was recommenced, surgeons went into the field with the conservative ideas which they had adopted in their studies. But facts soon modified their views, and we see them now-a-days bow before the necessity of active measures, and come back in great part to the practice of their predecessors. The reaction is not complete, and amputations are performed less often than they were. Conservative surgery has taken a large part in the wars of the East and of Italy, and the distinguished surgeons who followed our armies only protest against its exaggerations.

"Larrey, Rebes, and Baudens, insist that all fractures of the thigh should be amputated. Sedillot, Scrive, Guyon, and Legonest, are opposed to immediate amputation. M. Legonest cites twenty-four cases of the upper third of the thigh cured without amputation; M. Roux cites twenty-one from the army of Italy under his care at the Hospital of Saint Mandrier. It is pretty well decided that the wounded can survive these accidents, but are nearly sure to succumb to the operation.

"However, these are the opinions of military surgeons only They cannot be considered as final with the naval surgeons, as the circumstances are different. With the first the number of the wounded often surpasses all the means of properly attending to them, at their disposal; whereas the naval surgeon is always abundantly supplied with all requisites. The army surgeon is often called on to perform operations which could be avoided under more favourable circumstances, such as are to be met with on board ship. We are therefore enabled to practise conservative surgery more than our confrères are, and allowed to infringe on some of their principles."

We observe that Dr. J. MARION SIMS reports cases of *Vaginismus* treated by his new plan, which we have already reported.

The 'British Medical Journal' (June 12) contains a continuation of Dr. Latham's *General Remarks on the Practice of Medicine*. We extract the following paragraphs from a paper on *Apnœa Neonatorum*, by Mr. GEORGE GREAVES, of Manchester:—

"The phenomena of still-birth (excluding the cases of immaturity, morbid action, or atrophy, in the fœtus) are, therefore, ordinarily due to the excessive action of a cause which operates in every labour. That cause is the suspension of the communication between the maternal circulation and that of the placenta, produced, except in those rare cases in which, at an early period of the labour, extensive separation of the placenta takes place, by the closure of the curling arteries of the uterus by the uterine contractions. The blood in the placental capillaries, as has been said, no longer changed by the influence of the arterial blood of the mother, ceases to move onward; the umbilical circulation is in consequence suspended; the aorta of the fœtus becomes congested; and the ventricles of the fœtal heart being in consequence over-distended, their contractions become slower and slower, and finally cease.

"To this explanation it may, perhaps, be objected that the circulation through the cord cannot be suspended, inasmuch as it is still felt to pulsate, although slowly. But the beating of an artery under the fingers is, *per se*, no proof that the blood is passing through it. Tie the navel-string of a child just born, and, although pulsation at once ceases beyond the ligature, yet, between the point tied and the navel, it is for a time as vigorous as ever. A similar phenomenon, viz., pulsation in a part only of the cord, has often been observed where it was not tied. It is difficult to understand how accurate observers, like the late Dr. Denman, could remark that "the pulsation of the cord, when left untied, first ceases at the part nearest the placenta, and then by slow degrees nearer and nearer to the child, until it entirely ceases," without understanding the lesson which such a fact teaches, viz., that what has been mistaken for circulation through the cord is, in reality, nothing but the vibration communicated to the otherwise motionless columns of blood in the funic arteries by the contractions of the fœtal heart. . . .

"The explanation now attempted to be given of the phenomena of apnœa in newly born children, would be incomplete if another point were not referred to. The stoppage of the placental circulation, while it prevents the escape of blood from the body of the fœtus by the arteries of the cord, prevents also the entry of blood by the vein. One obvious effect of this is the loss of the vitalising influence of the maternal blood upon that of the child. As the

whole of the freshly arterialised blood conveyed by the ductus venosus, is carried direct to the left ventricle, and thence to the brain, when the circulation through the cord is suspended, the brain suffers in two ways. Not only is the blood, in consequence of the oppressed and enfeebled state of the heart, sent to the brain with less force, but it is supplied of a deteriorated quality, and the nervous centres are thus rendered unable to furnish the heart with the necessary supplies of nervous energy; hence the state of the child is that of asthenia, and, at least partial, syncope. This, of course, is true only of the purely apnœal, or apparently anæmic, forms of still-birth. It is very different in the apoplectic variety. In that form, respiration has to a small extent been performed, and has again been suspended. By one or two more or less imperfect inspirations, the pulmonary tissues have been sufficiently expanded to cause a part of the blood sent from the right ventricle to pass through the pulmonary arteries. The current through the canalis arteriosus has thus been diminished, and the pressure on the left ventricle to the same extent relieved. It has, in consequence, begun to contract with greater force and frequency. At the same time blood has, in greater quantities, been returned from the lungs to the left auricle, by which the valve of the foramen ovale has been closed, the necessary consequence of which closure, when respiration has again, from any cause been suspended, has been congestion of the right side of the heart, and of the general venous system. Hence the lividity of the surface, and the swollen features, the truly comatose state from cerebral congestion, and the occasional occurrence of sanguineous effusions within the cranium, or under the scalp. Notwithstanding this congestion of the right side of the heart, the left ventricle continues for a time to contract with its newly acquired frequency.

"Before adverting to the practical considerations arising out of the subject before us, one or two further observations may be made.

"The explanation given of the way in which very rapid labour becomes dangerous to the child will also account for the alleged effects of the secale cornutum. It is asserted by some writers that that drug has often been fatal to the child: it can only have been so by causing, in accordance with its mode of action, permanent, unresting contraction of the uterus, instead of the intermittent action of natural labour, unless we also believe it to be in part due to the poisonous influence of the secale on the child.

"We thus also learn the true mode of the production of the quasi-comatose condition of the fœtus during parturition, which has been described by writers as a useful provision of nature for the protection of the soft parts of the mother from the too lively movements of the child while passing through them.

"It is thus also explained how it has been possible for doubts to arise as to the breathing function of the placenta, because of the want of apparent difference between the blood in the umbilical vein, and that in the arteries of the cord. The comparison can, during the life of the mother, be made only when by the uterine contractions, the funis has been brought within reach of the eye and hand of the observer. If, as maintained in this paper, the effect of, even the earlier pains, is to stop the supplies of arterial blood to the placenta, that contained in the umbilical vein must, by the time it can be examined, have become almost, if not quite, as venous as that in the arteries of the cord. But were it possible in the last months of pregnancy, but before the commencement of labour, to inspect the interior of the uterus and especially the placenta, and the contiguous part of the uterine wall, and were our vision sufficiently piercing to pass through the coats of the vessels, we should see a marked difference between the contents of the arteries and those of the vein.

"Do we not, finally, thus obtain the true answer to a question to which so many different replies have been given, namely:—why a child first breathes? Can it be doubted that it is the congested condition of the aorta of the fœtus, and consequently of the ventricles of its heart, caused by the cessation of the current through the funic arteries and the *besoin de respirer* thus produced, which, conveyed to the nervous centres, excites them to send back to the muscles of respiration the stimulus which rouses them to act? Dr. F. Ramsbotham, who, in appendix L of his valuable work, has collected nearly all the various theories propounded on this subject, finds fault with them all, and in particular objects to that which I have adopted (which is substantially that of Blumenbach), that "the sense of suffocation produced by the closure of the umbilical vessels" cannot be the cause of the first inspiration, "because the child breathes and cries before the circulation through the umbilicus is suspended." But it has been shown that mere pulsation of the umbilical arteries is no proof that the blood continues to pass through them, and therefore that objection falls to the ground."

The 'Lancet.' Mr. SAVORY'S discourse on *Motion in Plants and Animals* is resumed. Mr. Savory explains the various kinds of motions observed in living bodies. 1. Molecular motions which are caused by vibration. 2. Motions due to osmotic currents. 3. Motions due to the physical properties of a tissue, especially of elastic tissue, numerous instances of which are found in the animal system. 4. Vital motion due to contractility. Dr. PEACOCK continues his clinical lectures on the *Recent Epidemic of Fever*, and Dr. HYDE SALTER gives an article on the *Diagnosis of Hæmoptysis*, in which he relates a most interesting case where there was the utmost difficulty in deciding whether the hæmoptysis came from the lungs or stomach. He observes:—

"Thus I felt in the same doubt as my friend, Mr. Guy, and was quite unable to pronounce positively as to the seat of the bleeding, when a circumstance occurred that to a certain extent supplied evidence of a positive nature. Just as I was going to leave, our patient was seized with a violent fit of coughing—the prolonged and fruitless coughing of a weak old man. After repeated efforts the material producing the cough was at length driven through the glottis, and spat from the mouth, when, behold! it was blood—a black clot, as big as a filbert, with one end distinctly frothy.

"This was the most conclusive evidence we had as yet obtained, and with this modicum of positive evidence I left our patient, after having suggested the frequent administration of small doses of turpentine and opium.

"I did not see him again until Tuesday morning. He had had a good day on the Monday, with no profuse hæmorrhage, and only the expectoration of clots. I repeated all my old inquiries, with the view of eliciting, if I could, any further information, until, on being told that all the clots expectorated were singularly alike, the idea occurred to me that a close inspection of them might possibly reveal the seat of their formation, and that they might perchance be found to be moulded in some one part of the air-passages. I inquired of the attendant of our patient if the clots appeared to be branched, or if he had shaken them out in water, and, being answered in the negative, I procured a basin of water, and shook out in it the last clot expectorated, and which I was informed was the counterpart of the rest. To my great satisfaction I saw it, as I shook it out, unfold into a tree of blood, a perfect cast of the bronchial tubes, resembling, except in colour, the plastic bronchial casts so frequently seen. The accompanying outline represents this blood-cast, of the natural size.

"The whole thing was now cleared up, as far as the seat of the bleeding went; there could no longer be any doubt that the hæmorrhage was poured out into a principal bronchus, of which, and of the immediate ramifications of which, it formed the mould. And I was inclined to think that this bronchus was the left, for this special reason: on listening at the base of the left lung posteriorly, I found that the crepitation which I had heard so abundantly on my previous examination was quite gone. Now, if this crepitation had been due to the patient's chronic bronchitis, as I at first thought it was, it could not have so quickly and so completely cleared away. If not due to the bronchitis it must have been due to the blood—to blood that had gravitated to the most dependent part of the lung from the seat of the bleeding; being, therefore, in the left lung, the bleeding must have been on the left side, and the size of the main trunk of the cast showed that it could not have been moulded in a tube of less calibre than the principal bronchus. I was induced thus to fix upon the exact spot, and say that the left bronchus was the seat of the hæmorrhage.

"Now, taking these data, what diagnosis could be built upon them? No other, I think, than that the bleeding was aneurismal; that the aneurism communicated by a small fissure—a fissure so small that the bleeding was intermittent—with the left bronchus; that it was, therefore, probably an aneurism of that part of the aorta beneath which the left bronchus passes—*i. e.*, the convexity of the arch, or the commencement of the descending portion; lastly, that the aneurism was small, as it revealed itself by no physical signs—there was no pain, no dysphagia, no pulsation, no murmur, the pulse was alike in both wrists. There was one circumstance in the form of this clot that, as I interpret it, strongly pointed to an aneurismal origin of it. Close to the large extremity of the main trunk, two branches seemed to arise by a common stem; but on separating these branches it was found that they were adherent at their extremities; in fact, that they formed a ring. Now, I cannot conceive how a coagulum of this form—an unramified ring—could be moulded in a bronchial tube. I think it must have been formed in the aneurism, and dragged thence when the clot was discharged; that it was, in fact, a portion of the coagulated blood in the aneurism; that the size of the ring probably marked the size of the aneurism, and that the pedicle by which it was attached occupied the orifice of communication between the aneurism and the bronchus. This may seem making extensive deductions from small premises, but I do not see how the annular form of this part of the clot can be otherwise explained."

Mr. FREDERICK HALL communicates to the same journal a report of a case of *Penetrating wounds of the Thorax; wound of the Lung; Pneumo-Thorax and Emphysema.* In this case there was a multiplicity of self-inflicted wounds from which the patient re-

covered in spite of himself. Mr. Dutt narrates a case of cure of *Chylous urine*, by the administration of fifteen minims of the tincture of the sesquichloride of iron three times a-day.

The 'Medical Times and Gazette.' *Clinical Remarks on Seven Cases of Ovariotomy*, by Mr. SPENCER WELLS, is an instructive article. We have quoted some portions of it in another part of the journal.

Mr. PRICE continues his papers on the *Winter Climate of Menton*, and DR. RAMSBOTHAM reports various operative cases in Midwifery. We extract a few cases :

"*Case* 118.—On May 6, 1841, at 4.30 p.m., a medical friend requested my assistance to Mrs. W., in Lambeth, in labour of her first child. The membranes broke on the 4th, and she had been suffering strong pains ever since. I found her very restless, with considerable fever and an exquisitely tender abdomen. The head was partially protruding through the brim, the base of the skull being still above; neither ear could be felt; the brim measured in its conjugate diameter very little more than three inches; the os uteri was not entirely dilated, but it was soft. The urine had been drawn off by the catheter very recently. Believing the child to be alive I endeavoured to deliver by the long forceps. I succeeded in locking the blades with great difficulty, but with all the power I dare exert, I could not move the head in the least. I therefore took them off and perforated. Extraction, even after the chief part of the brain had been evacuated, occupied fully an hour. The placenta was soon expelled, and the woman recovered very well.

N.B.—I have always had less compunction in perforating a fœtal head after I have adapted the long forceps, and made abortive attempts to deliver by that instrument, than if those attempts had not been made; because I am quite certain that if I cannot draw the head through the pelvis, when I have got a firm hold of it by the long forceps, nature will never be able to expel it unassisted.

"*Case* 121.—On August 9, at 7.30 a.m., I was sent for by one of my pupils to Mrs. A., in Shadwell, in labour of her sixth child. Her labours had always been lingering; twice she had been delivered by craniotomy, but three children had passed whole, two being alive. The membranes had been broken twelve hours, and the pains had been strong all night; the head was partly in the pelvis, the base of the skull being above the brim, which measured, as nearly as possible, three inches in the conjugate diameter. The bladder had acted recently. I tried to apply the long forceps, but, as I anticipated, I could not make them lock. As the woman's powers were still good, and the uterus was acting vigorously, as the head was not wedged or locked in the brim, and, moreover, as she had expelled two living children, I was unwilling to perforate the skull at that time, and therefore left her under my pupil's care, and saw her again at 3 p.m. I found that the head had not advanced in the least, although the pains had continued powerful. The patient had become fevered and irritable; and I thought it better to deliver her at any rate. I relieved the bladder by the catheter, and again tried the long forceps; again, however, I was baffled in my attempts to lock them. I therefore at once perforated the skull; extraction occupied half an hour; the head was very strongly ossified. The placenta passed speedily, and she recovered well.

"*Case* 124.—On May 16, 1842, at 11.30 p.m., I was sent for by a medical friend to Mrs. J. Houndsditch, aged 24, in labour of her first child. Pains commenced active on the 13th, and since that time she had not enjoyed one hour's sleep. The head came low into the pelvis before the membranes broke, and must have been impacted there also, because a large quantity of liquor amnii came away from the uterus immediately it was extracted. The membranes had not been broken more than six hours when I was called. The pains were most violent; the woman was screaming very loudly. The pelvis was entirely filled up by the head, which was greatly elongated, so much so, indeed, that neither ear could be felt. It was very narrow at the outlet, from the tuberosities of the ischia approaching each other too nearly, and the external parts were exceedingly rigid. There was reason to believe the brim was also narrow from the elongated condition of the head, which I subsequently found to be the case. I thought I could deliver by the long forceps, and applied them easily; but, although I used considerable exertion, I could make no impression upon the head. I therefore perforated, and was an hour extracting. In fifteen minutes some hæmorrhage came on, which induced me to remove the placenta from the uterus. I found it strongly adherent throughout almost its whole extent; and the uterus was powerfully contracted around it, so that I had great difficulty in separating it. When I attempted to withdraw my hand with the placenta in its grasp through the pelvic outlet, I discovered it was too narrow to admit my doing so. I was therefore obliged to remove my hand open, and trust to the funis for bringing away the placenta; but this was easily effected, as I had separated it, and it was lying loose in the vagina. The woman recovered without a bad symptom.

DR. WALTER FOSTER relates a *case of Colloid Cancer of the Great Omentum.*

The 'British American Journal,' June. The profession in America, having an extensive flora at command have introduced many new remedies, and seem indeed to have a passion for experimenting in the region of Therapeutics. This number of the 'British American Journal' contains an article by Dr. D. McGILLIVRAY, on *Acute Articular Rheumatism, treated by the Tincture of the Boletus Laricis Canadensis.* We extract it :

"January 9, 1862, I was requested to visit Mrs. H——, aged thirty, of spare habit of body and delicate constitution, suffering from an attack of acute articular rheumatism. Two months previously she gave birth to her first child; shortly after her confinement, inflammation of the left breast set in and resulted in suppuration. On seeing my patient at this time, she was confined to bed in a helpless condition, suffering from severe pain in her arms, elbow and wrist joints, in the articulations of the fingers, and in the corresponding parts of the lower extremities. On examining the parts affected, I found them considerably swollen, hot, red and painful; the joints, though affected with constant and excruciating pain, could bear gently rubbing them without causing much uneasiness, but on the contrary, it seemed to alleviate the patient's sufferings, giving temporary ease. Tongue white and coated; profuse perspiration at night; thirst; a hard full pulse at 98; bowels costive; urine high coloured. The following mixture was given :

℞ Potassæ Nitrate, ℥ij.;
Potass. Iod., grs. xxxvj.;
Tinct. Hyoscyami, ℥iij.;
Aquæ, ℥viij.

"Fiat mistura. Capiat cochleare amplum ter in die. Dover's powder at night, and a full dose of castor-oil the following morning.

"Third day.—Bowels relieved; pulse 92; pain in joints still severe. Ordered hot fomentations to be applied to painful joints. This treatment was pursued for several days without producing any apparent benefit in either alleviating the patient's sufferings, or arresting the progress of the disease, and now the hip and shoulders joints had become affected, and the other joints more painful and swollen.

"January 16.—Discontinuing the above mixture, I gave the tinct. boleti laricis canadensis as prescribed by Dr. Grant :

℞ Tinct. Bolet. Laricis., ℥jss.;
Aquæ puræ, ℥viij.

"Fiat mistura. Capiat cochleare amplum quaque tertia hora. ℞. morphiæ muriat. gr. ½ at bed-time.

"January 18.—She says she feels a good deal better; lies with more ease and comfort for a longer time in one position; pain in joints only on moving her limbs; pulse 79.

"January 20.—Pain and swelling in the affected parts decreased; perspired profusely through the night, sleeps little, and wakes up in fright; pulse 80; bowels regular. Ordered hot fomentations to painful joints.

"January 21.—Is troubled with a flying pain in her chest, but no symptom of the heart being affected; pain only in knee and ankle joints; less distension in those parts; pulse 80; urine more copious and pale.

"January 23.—Finds herself considerably better; perspired freely during last night; feels stronger and free from pain; can walk about without the least discomfort or uneasiness; pulse 70; skin of natural heat; bowels regular; declares herself quite well and able to resume her household labour.

"NOTE.—This case is interesting chiefly from its containing a contrast between the results of the eliminative treatment and that by the boletus laricis canadensis. The patient deriving little benefit from the former, while the latter rendered her quite convalescent in the same period of time. Should this remedy be found as satisfactory in the treatment of rheumatism in other cases as in this, it will no do doubt prove an invaluable acquisition to the Materia Medica."

The same journal contains reports of three or four cases of excision, including the ankle-joint, the inferior maxillary bone, and the elbow-joint. The resection of the ankle-joint was performed by Dr. CANNIFF, of Toronto, and, as the operation is comparatively rare, we extract the more important portion of the report :

"For the history of the case prior to my acquaintance with the patient, I am indebted to his brother-in-law, Mr. B.——, who is a student of medicine.

"Mr. G——, æt. twenty-one, of the County of Elgin, on the 4th July, 1861, was thrown from a carriage and received an injury in the left ankle. On examination, which took place soon after the occurrence, the foot was found *dislocated outwards;* the "fibula" broken about two inches above the "*malleolus,*" and a large prominence presented itself on the inner side of the *os calcis.* Reduction

was attempted by extension and counter-extension, which was continued for some time with partial success.

"A prominence was now found just at the posterior and inner angle of the scaphoid, which was the anterior part of the *astragalus*. This was not replaced. Short splints were used. The limb was placed in a fracture box, and cold water applied. In about three weeks nearly the whole of the dorsum of the foot began to slough, as well as the part around and in front of the internal *malleolus*. Cold was then discontinued, and poultices used instead, and, in a few days, the foot bones were bare. The protruding fragment of the *astragalus* was now adjusted, and strong hopes were entertained of a speedy recovery. And from this time externally there was an improvement; cicatrisation commenced and went on rapidly, repairing in a short time nearly the entire breach. A small spot, however at the upper and inner part of the *os calcis* remained open, and through this, about the tenth week, was thrown off the 'lesser process' of this bone. Soon after *pus* was detected immediately in front of the external *malleolus*. A deep incision was made reaching the inner space between the *os calcis* and *astragalus*, forming a free communication with the opening on the opposite side. This remained; a constant discharge was kept up, and a second piece of bone was thrown out. By this time, the patient, by the help of crutches, began to get around. But the part being still *poulticed* and allowed to hang, the swelling became great and the pain increased. Things continuing thus for some months, the patient's spirits sank, and hopes of recovery were quite abandoned. He resolved, however, on making another trial and seeking aid elsewhere. Consequently, on the 19th February, 1862, he came to Toronto, and placed himself under my care. Upon examination, I found the foot and lower extremity of the leg very much swollen and evidently œdematous which condition I concluded was due to long-continued passive congestion. There were two *sinuses*, one on the inner side just anterior to the internal *malleolus*, the other on the outer side below the external *malleolus*. In front of the inner *sinus* was a long *cicatrix*, presenting a very unhealthy appearance. By passing a probe into the inner opening, I found the anterior part of the *astragalus* in a necrosed condition. Directing the instrument downwards upon the *os calcis*, the superior surface of this was found to be in a softened and disorganised state. The probe could also readily pass to the lower extremity of the *tibia*, which was evidently dead, and the lower end of the *fibula* on examination through the external opening was also found affected. I ordered the limb to be kept in an elevated position, and a bandage to be applied to the foot, the skin of which was in a state of great irritation.

"This treatment was continued for a few days with marked benefit; the patient in the meantime becoming more cheerful, and the pain somewhat subsiding.

"A consultation was held at which the question of amputation or resection was considered. It was finally determined to adopt the latter procedure. Consequently, on the 5th of March last, assisted by Dr. Lawlor, of this city, I performed the operation as recommended by Hancock, which I give you in his words:

"Commence the incision about two inches above and behind the external *malleolus*, and carry it across the instep to about two inches above and behind the internal *malleolus*. Take care that this incision merely divides the skin and does not penetrate beyond the *fascia*. Reflect the flap so made, and next cut down upon the external *malleolus*, carrying your knife close to the edge of the bone, both behind and below the process; dislodge the *peronei tendons* and divide the external lateral ligaments of the joint. Having done this with the bone nippers, cut through the *fibula* about an inch above the *malleolus*, remove this piece of bone dividing the inferior *tibio-fibular* ligament, and then turn the leg and foot on the outside. Now carefully dissect the tendons of the *tibialis posticus* and *flexor communis digitorum* from behind the internal *malleolus;* carry your knife close around the edge of this process, and detach the internal lateral ligament; then, grasping the heel with one hand, and the front of the foot with the other, forcibly turn the sole of the foot downwards, by which the lower end of the tibia is dislocated and protruded through the wound. This done, remove the diseased end of the tibia with the common amputating saw, and afterwards with a small *metacarpal* saw placed upon the back of the upper articulating process of the *astragalus*, between the process and the *tendo achillis*; remove the former, by cutting from behind forwards; replace the parts "*in situ;*" close the wound carefully on the inner side and front of the ankle, but leave the outside open, that there may be a free exit for discharge; apply water dressing; place the limb on its outer side on a splint, and the operation is completed."

"I found the lower extremity of the *fibula* very much enlarged and somewhat softened, while bony material had been deposited on the outer surface of the periosteum, consequently I experienced some difficulty in dislodging the tendons of the *peronei* muscles. The fibula was easily divided by the bone pliers, but the piece was not easily removed, because of the new *osseous* material already mentioned. Turning the foot on the outer side, I proceeded to dislodge the tendons from the groove on the posterior surface of the tibia, and here also the ostroid growths proved exceedingly troublesome. Having divided the internal lateral ligament, I removed the anterior portion of the *astragalus* which was in a state of *necrosis*, and had evidently been broken from the other portion. I then seized the foot in the manner recommended by Hancock, and with very little force turned out the end of the *tibia*. Next I removed the remaining portion of the *astragalus*, which was in a state of disorganisation. I then, with the ordinary amputating saw, removed about three-quarters of an inch of the *tibia*. That portion removed was found softened and carious. The tibia proved to be more seriously involved than had been anticipated. After a hasty consultation, it was resolved to remove another portion of the bone; so extending the section in the integument about an inch, and dissecting the soft part from the bone, I removed nearly an inch and a half more both of the *tibia* and *fibula;* I then gouged away a portion of the *os calcis* until the diseased structure was all removed, The operation was now completed; but it must be confessed the prospect of saving the foot did not appear very bright. There was an hiatus of more than three inches; but as a source of hope there was the fact, that neither the anterior nor the posterior tibial artery had been divided. The blood consequently circulated as freely in the foot as before.

"The limb was placed in a fracture-box, the flap having been secured by a few sutures and adhesive straps. Proper support was given to the foot, and cold-water dressing applied. The loss of blood had been very slight. The patient had remained under the influence of chloroform during the whole of the operation, which was necessarily long, upward of an hour, quickness in operating having been no consideration. The patient passed a restless night, suffering constantly from nausea and vomiting, caused probably by the quantity and inferior quality of the chloroform used. The part was also somewhat painful.

"Very little inflammation followed, but that portion of the flap where the cicatrix was had sloughed away, leaving a very large opening, cicatrization quickly commenced and progressed rapidly. The discharge was at no time very great. The patient was able to get around on his crutches within one month.

"At the end of nine weeks, the limb presents the following appearance: A healthy-looking and limited cicatrix, marking the incision through the integument; a very small opening internally, where the most sloughing was; the foot reduced to almost its natural size, and in a natural position. There is by admeasurement not more than an inch and a half shortening. The bones of the foot have not yet joined with those of the leg. The foot can be moved passively in any direction; yet there is a comfortable degree of firmness, which has been constantly increasing. The patient can move the foot and toes in a natural manner. In a word, there is every prospect of an excellent joint. His health has improved, and, as a matter of course, he is very thankful that his foot has been saved.

"At the expiration of a year I shall take occasion to inform the Profession of the final result."

MEDICAL SOCIETIES.

EPIDEMIOLOGICAL SOCIETY.

DR. BARINGTON, PRESIDENT, in the Chair.

A paper by Dr. Slayter, the Health Officer of Halifax, was read by the Secretary of the Society, entitled

NOTES ON THE RECENT PREVALENCE OF YELLOW FEVER IN SEVERAL OF H.M.'S SHIPS OF THE WEST INDIA SQUADRON UPON THEIR ARRIVAL AT HALIFAX; WITH REMARKS ON THE CLIMATE AND DISEASES OF THAT TOWN.

Halifax is built on a promontory nearly surrounded by water, and lies on a slope opposite one of the noblest harbours in the world. It possesses a well-arranged system of sewerage, and the houses are not overcrowded. The soil is dry and free from alluvial deposits, and from those miasmatic influences so necessary for the propagation of contagious diseases. The temperature in the hottest days of summer seldom exceeds 80°, and is generally below 75°. All these circumstances tend to render Halifax the safest rendezvous for seamen suffering from that fatal scourge—yellow fever—which has for some years past been prevailing so extensively in the Gulf of Mexico.

H.M.'s ship 'Firebrand' arrived from Jamaica, at Halifax, on the 4th of July, 1861, after a passage of twelve days. There were then seventy-nine of the crew on the sick-list—all fever cases. Ten deaths had occurred during the voyage from Port Royal. Many of the sick were moribund, the attendants were exhausted from constant watching, and dejection prevailed amongst all on board. The atmosphere in the between-decks was very impure, the port-holes having been closed in consequence of stormy weather. All the sick were at once transferred to a hulk moored off the naval hospital, and the convalescents and others sent to a storehouse in the dockyard. There were fifteen convalescents, thirty convalescing, and

thirty-four seriously ill at this time. Several fresh cases occurred subsequently, and two were fatal with black vomit. Besides these deaths in the hospital on shore, sixteen took place amongst the sick in the hulk. From the commencement of the disease, the 'Firebrand' lost forty-nine of her crew, out of a hundred and seven attacked.

H.M.'s ship 'Spiteful' arrived on the 16th August, 1861, at Halifax from the Bahamas, which she had left seven days before. Eleven deaths had occurred on the passage, and forty-six cases were on the sick-list on arrival; two died that night. The sick were at once sent to the hulk, and the convalescent and the well to the dockyard. Some of these sickened with the fever on shore, and were then transferred to the hulk. Altogether thirty-three sick were treated at Halifax, and of these twelve died. The 'Spiteful' lost in all thirty-six of her crew, out of eighty-eight attacked.

H.M.'s ship 'Racer' arrived at Halifax from Nassau on the 3rd of September, 1861. During the passage nineteen cases and five deaths occurred. Several fresh attacks took place after arrival. The total number of attacks among the crew of this ship was sixty-one, of which twenty proved fatal.

The case of HM.'s ship 'Jason' is especially instructive. She reached Halifax on the 2nd of September, 1861, from the Gulf of Mexico, which she had left sixteen days before in consequence of fever having broken out on board. During the voyage forty-six fresh cases and ten deaths took place. All the sick were sent to a building in the dockyard. A good many fresh attacks occurred after arrival. The total number of attacks among the crew was seventy-nine, and seventeen proved fatal. About the middle of November the 'Jason' returned to the West Indies. She had been cleansed out while at Halifax, and much filth had been removed from her hold. Her ventilation also, which had been very defective, had been improved by cutting fresh hatches in the decks, taking down bulkheads, &c. Within eight days, however, after leaving Halifax, typhoid fever appeared among the crew, and the first two cases were fatal. The disease continued to appear at intervals on board while the ship was off the Mexican coast. It did not assume the characters of black-vomit fever until the month of March, and the change of type seemed to be consequent upon the ceasing of the northerly winds, and the setting in of close, muggy weather. Before the decided yellow fever manifested itself, the health of the ship's company had not been satisfactory; cases of ordinary catarrh, dyspepsia, and diarrhœa showing a tendency to lapse into fever. The same thing had been observed the year before, prior to the outbreak of the more malignant disease. Notwithstanding the purification of the ship's hold at Halifax, and every effort to keep the bilges as clean as possible, the latter were at times offensive. It was judged expedient that the 'Jason' should again leave the West Indies and proceed to Halifax, which she reached at the end of April. No fresh cases of fever had occurred on board for a fortnight previously.

Without further details, it may be mentioned that of 855 men, the aggregate crews of five steamers, no fewer than 499 were attacked with fever, and 162 died. It is instructive to learn that not a single case of the fever occurred among any of the people about the dockyard at Halifax, or in any other person of the town.

In conclusion, Dr. Slayter remarked that Halifax has not been visited by Asiatic cholera since 1844; that diptheria has prevailed for the last six or seven years; that the practice of vaccination is at times much neglected, and that consequently small-pox is every now and then making its appearance. Unfortunately there is no correct registration of deaths kept.

Dr. COPLAND was of opinion that the original source of the fever on board the ships, and subsequent unusual occurrence at Halifax, were readily explicable by infection. He believed also that there was in many respects an affinity between yellow, typhus, and typhoid fevers.

Dr. MILROY pointed out the highly-important facts mentioned in the history of the 'Firebrand' and 'Jason' as affording strong evidence how much the malignity of the fever, if not its actual development, was dependent upon the condition of the ships themselves in respect to ventilation of the decks where the men were berthed, and of the state of the holds. This paper strongly confirmed the views of Dr. Archibald Smith as to the intimate alliance between yellow and typhoid fevers, and showed the necessity of adopting the same sort of preventive measures in both.

Dr. BABINGTON said that we might draw two important conclusions: first, that yellow fever is certainly under certain circumstances contagious, just as typhus is; and, secondly, that although contagions, we must recognise the great importance of sanitary precautions in preventing and arresting it.

Dr. ARCHIBALD SMITH (for many years resident in Peru), in answer to a question of the President on the influence of temperature on yellow fevers, stated that he had noted all the essential symptoms of the disease at an elevation of 11,250 feet, with a temperature in the wet season of 62° within doors, and but little variation day and night. At this temperature the disease lost none of its energy. In 1853 yellow fever appeared simultaneously on both sides of the Andes, and in 1854 assumed its most malignant character as well by the sea-board as on the hill land. It was shown that these epidemics were of one generic nature. The yellow-fever symptoms became modified gradually into the typhous or typhus, in the transit from the Pacific shores to higher and still higher regions of the Andes. In the warmer inland valleys—as, *e.g.*, in the sugar-growing district of Abancay—the fever which, near the snows of the Cordillera, was metamorphosed from the typhus (icterodes of the coast) into a form which in a great measure represented ordinary British typhus, was again reinstated with its most aggravated coast symptoms of yellow fever—such as intense frontal headache, dark sanguineous vomiting or evacuations, subcutaneous hæmorrhage in form of large dark maculæ, nasal hæmorrhage, intense yellow colour of the skin, and the most extreme prostration of vital forces. In the Sierra it was propagated slowly from place to place and from person to person. It was all but incurable in the dark and crowded huts, but yielded readily in a great majority of cases to early treatment under the advantages of pure air and hygiene. Left to itself in the hovels of the Indian poor, it was prodigiously fatal.

Dr. Chowne, and Dr. Pritchall of the Bengal army, also took part in the discussion.

ROYAL MEDICAL COLLEGE.

THE "FOUNDER'S DAY."

The annual celebration of the "Founder's Day" of this institution was held on Thursday, the 17th instant. The proceedings were of the most satisfactory character, and served, if possible, to increase the desire of the friends of the College to promote its prosperity.

The proceedings commenced, as usual, with divine service, after which the scholars dined, and were addressed by the Rev. Archdeacon Robinson; and on his proposing "The health of the Founder," they honoured the toast with three-times three loud and hearty cheers.

Mr. Propert, in acknowledgment, spoke most kindly and encouragingly to the scholars, and trusted they would carry with them the stamp of the Royal Medical College through life.

The school-room was then the scene of the proceedings. The speeches of the scholars were delivered so as to elicit the admiration of the company. The prizes for proficiency and good conduct, consisting of books of high class and handsome binding, were then distributed by the Bishop of Oxford, who in the most encouraging terms complimented the successful candidates. He expressed the high satisfaction he felt in his connexion with the College, and assured the pupils that no amount of ability would secure success without perseverance, and instanced the conduct of Mr. Propert as a striking example of that truth. God had given him not only the heart to conceive, but the will to carry his project into effect—the provision of a home for his less fortunate professional brethren, and the means of procuring for their children an education which would place them in the most honourable positions in English society.

Mr. Propert tendered his thanks to the Earl and Lady Manvers, which were gracefully acknowledged. He also paid a just tribute to Lord Chelmsford, the President of the College, who, he lamented to say, was prevented joining them by a domestic calamity.

A handsome cold collation was prepared for the visitors; after which the health of "The Queen and the Royal Family" was drunk. Her Majesty had graciously permitted the new wing of the College to be called the "Albert Wing."

On proposing "The Church," Mr. Propert acknowledged the assistance he had received from his Grace the Archbishop down to the humblest curate.

The Bishop of Oxford, in reply, proposed "The Founder's" health, which was drunk with three times three, led by Colonel O'Halloran.

The Founder of the College then thanked the assembly most sincerely for the good feeling they had exhibited towards him, and assured them that his efforts should never flag so long as he had strength to work for the benefit of the College. He thanked the Head Master for his excellent management of the school; and referred to the Earl Manvers, who was one of the earliest promoters of the institution.

The Ven. Archdeacon Robinson gave the health of the "Rev. Dr. Thornton, the Head Master," and complimented him on the successful results of his mode of training and good management, and the character, the tone, the social and moral bearing of the pupils.

The Rev. the Head Master, in acknowledgment, described the system by which the school was conducted, and spoke in the highest terms of the valuable aid he had received from the other masters.

The health of "The Residents of the College" was then given by Mr. Propert, and acknowledged by Mr. Trash.

After some other toasts had been drunk, the visitors retired and promenaded the beautiful grounds, while the more juvenile portion

repaired to the new school-room, where dancing was for some time kept up with great spirit.

During the day the pupils, under the superintendence of Serjeant Gough, went through their martial exercises in the grounds, the band being formed entirely from amongst themselves.

On the whole the Founder must have been highly gratified with the day, and the anniversary may be considered as one of the most auspicious occasions connected with the history of the institution.

THE LUNACY REGULATION BILL.

COPY OF A PETITION PRESENTED BY SIR HUGH M'CHALMONT CAIRNS, Q.C., M.P., TO THE HOUSE OF COMMONS, IN OPPOSITION TO THE THIRD CLAUSE OF THE LUNACY REGULATION BILL.

To the Honourable the Commons of the United Kingdom of Great Britain and Ireland in Parliament assembled.

The petition of the undersigned Presidents, Fellows, and Members of the College of Physicians of London, and President, Fellows, and Members of the Royal College of Surgeons of England,

Humbly sheweth,—That your petitioners humbly represent that in Clause 3rd of the Lunacy Regulation Bill, now under the consideration of your honourable House, it is proposed that in all future commissions of lunacy in the nature of a writ *De Lunatico Inquirendo*, the medical witnesses who have examined the person alleged to be of unsound mind will only be permitted to state in evidence what they themselves had observed in relation to the appearance, conduct, and conversation of the person whose state of mind is the subject of judicial inquiry, and will be rigidly excluded from giving expression to any opinion formed by them from a consideration of the phenomena, mental and physical, they have noticed during their examination of the alleged lunatic, and to which, upon oath, they will be called upon to depose.

That your petitioners respectfully call the attention of your honourable House to the serious stigma this clause casts upon the members of the learned profession of Medicine, inasmuch as it expresses a total want of confidence in any conclusions that may be drawn by skilled and scientific medical witnesses from an examination of particular physical and mental states alleged to be symptoms of soundness or unsoundness of mind.

That the said clause reduces the scientific to the standard of a non-professional witness, and will tend, if it be passed in its present form, to greatly depreciate in general estimation the value of all medical experience and scientific research in relation to the treatment of insanity and the study of mental pathology.

That your petitioners respectfully suggest that if a skilled medical witness is to be declared by Statute incompetent to give before a court of justice an oral opinion as to the sanity of a person whose soundness of mind and capacity to manage himself and property are matters of question and inquiry, and whom he has himself seen and examined, he should be considered incapable of making an affidavit in which an opinion is expressed in support of an application to the Court of Chancery for the issue of a commission of lunacy, and at the same time be held incompetent to sign, as at present authorised by Act of Parliament, the certificate of lunacy required by the statute preparatory to placing an insane person under legal medical care and treatment.

That your petitioners consider that the restriction placed by this clause to the expression of any opinion which the Medical witness may have formed from an examination of the person alleged to be insane will necessarily throw upon the court and jury the serious responsibility of deciding the existence of insanity in subtle and doubtful conditions of the intellect, in the absence of that special knowledge, and apart from that practical experience, which in so many cases are absolutely essential to the right elucidation of morbid mental phenomena.

Your petitioners, therefore, pray that your honourable House will, with the view to the successful administration of justice, when in committee, so modify the third clause of the Lunacy Regulation Bill as to render admissible, in all cases of inquiry before a master or judge of any superior court of law, the opinion of the scientific professional witness, based upon facts observed by himself, as to the mental soundness or unsoundness of any person whom he has seen and examined, and whose sanity of mind is the subject of judicial investigation.

And your petitioners will ever pray.

THOS. WATSON, M.D., President of the Royal College of Physicians, London.
JOSEPH HENRY GREEN, D.C.L., F.R.S., President of the Medical Council.
GEO. BURROWS, M.D., F.R.S., Member of the General Medical Council.
T. MAYO, M.D., F.R.S.
H. H. SOUTHEY, M.D., F.R.S., D.C.L.
B. G. BABINGTON, M.D., F.R.S., President of the Royal Medical and Chirurgical Society.
J. COPLAND, M.D., F.R.S., Senior Censor of the Royal College of Physicians, and President of the Pathological Society.
J. R. MARTIN, F.R.S., Physician to the Secretary of State for India in Council.
A. B. GARROD, M.D., F.R.S., Physician to University College Hospital.
J. PAGET, V.P.R.S., Surgeon to St. Bartholomew's Hospital.
C. J. B. WILLIAMS, M.D., F.R.S.
C. B. RADCLIFFE, M.D., Physician to the Westminster Hospital.
C. H. HAWKINS, F.R.S., President of the Royal College of Surgeons of England.
J. WEBSTER, M.D., F.R.S.
W. FERGUSSON, F.R.S., Professor of Surgery in King's College.
W. LAWRENCE, F.R.S., &c., Serjeant-Surgeon to the Queen, and Surgeon to St. Bartholomew's Hospital.
G. JOHNSON, M.D., F.R.C.P., Physician to King's College Hospital.
S. J. GOODFELLOW, M.D., F.R.C.P., Physician to the Middlesex Hospital.
J. ALDERSON, M.D., F.R.S., Treasurer to the Royal College of Physicians.
P. HEWETT, Surgeon to St. George's Hospital.
R. DRUITT, M.R.C.P., Vice-President of the Obstetrical Society and Medical Officer of Health to St. George's, Hanover square.
H. W. FULLER, M.D., F.R.C.P., Physician to St. George's Hospital.
E. H. SIEVEKING, M.D., F.R.C.P., Physician to St. Mary's Hospital.
B. W. RICHARDSON, M.A., M.D., Senior Physician to the Royal Infirmary for Diseases of the Chest.
A. SHAW, Surgeon to the Middlesex Hospital.
R. QUAIN, M.D., Physician to the Hospital for Diseases of the Chest.
G. HARLEY, M.D., Professor of Medical Jurisprudence in University College, London.
F. SIBSON, M.D., F.R.S., F.R.C.P., Physician to St. Mary's Hospital, President of the Medical Society.
W. T. SMITH, M.D., F.R.C.P., Physician-Accoucheur to St. Mary's Hospital, President of the Obstetrical Society of London, Examiner in Midwifery in the University of London, &c.
A. S. TAYLOR, F.R.S., Professor of Medical Jurisprudence, &c., in Guy's Hospital.
T. B. CURLING F.R.S., Surgeon to the London Hospital.
W. BRINTON, M.D., Physician to St. Thomas's Hospital.
W. W. GULL, F.R.C.P., Physician to Guy's Hospital.
F. C. SKEY, F.R.S., Surgeon to St. Bartholomew's Hospital.
A. BILLING, M.D., F.R.S.
R. FERGUSON, M.D., Physician and Accoucheur to the Queen.
E. J. SEYMOUR, M.D., F.R.S.
G. O. REES, M.D., F.R.S., F.R.C.P., Physician to Guy's Hospital.
W. COULSON, Surgeon to St. Mary's Hospital.
W. H. WALSHE, M.D., late Professor of Medicine in University College.

Births, Marriages, and Deaths.

BIRTHS.

BLACK.—On the 20th inst., at Queen Anne street, the wife of Patrick Black, M.D., of a son.

CHEVES.—On the 16th inst., at Millbrook, Devonport, the wife of A. B. Cheves, M.B., of a son.

CORRY.—On the 13th inst., at Victoria street, Belfast, the wife of T. C. Steuart Corry, M.D., of a son.

CUOLAHAN.—On the 13th inst., at Bermondsey, the wife of H. Cuolahan, M.D., of a daughter.

INGLIS.—On the 9th inst., at Sandgate, Kent, the wife of Dr. Inglis, C.B., 64th Regiment, of a son.

JOHNSTON.—On the 20th March, at Wellington, New Zealand, the wife of Alexander Johnston, Esq., M.R.C.S., Colonial Surgeon, of a daughter.

RAYNER.—On the 5th inst., at Great Malvern, the wife of Thomas Rayner, M.D., of a daughter.

SQUIRE.—On the 6th inst., at Orchard street, Portman square, the wife of William Squire, L.R.C.P., of a son.

TODMAN.—On the 26th May, at Magill, South Australia, the wife of James Todman, M.D., of a son.

VIDAL.—On the 16th inst., at Aveley, Essex, the wife of W. F. Vidal, Esq., M.R.C.S., of a daughter.

MARRIAGES.

ALLEN—STEELE.—On the 1st inst., at St. Michael's church, Stone, J. Allen, M.D., of Longton, to Elizabeth, daughter of R. Steele, Esq., Kibblestone villa, Stone.

BARKWAY—WHITE.—On the 15th inst., at Lavenham, Suffolk, R. Edgar E. Barkway, Esq., M.R.C.S., Bungay, to Emily Wilhelmina, daughter of W. Middleton White, M.D., Lavenham.

GIBBON—PIRRIE.—On the 8th inst., at Union street, Aberdeen, Alex. Gibbon, Deputy Inspector-General of Hospitals, late of H.M.'s Bengal Army, to Helen Lumsden, second daughter of William Pirrie, Esq., F.R.S.E., Professor of Surgery in the University of Aberdeen.

HORTON—PRATT.—March 27, at St. George's Cathedral, Freetown, Sierra Leone, James Africanus Beale Horton, M.D. Edin., Staff Assistant-Surgeon of H.M. Forces on the Gold Coast, to Fannie Marietta, eldest daughter of W. H. Pratt, Esq., Marshal of the Vice-Admiral's Court of Sierra Leone.

SELLER—HARCK.—On the 14th inst., at Dresden, Hugo Seller, M.D., son of the late Burkhardt W. Seller, M.D., to Mary, youngest daughter of Frederick Harck, Esq., of Leipzic.

WALE—WARD.—On the 10th inst., at the Parish church, Epsom, Surrey, the Rev. William Wale, of Richmond, Fellow of the University of Durham, and Head Master of Tottenham College, to Charlotte Mary, second daughter of Joseph Ward, Esq., M.R.C.S., Hill house, Epsom.

WINTERBOTHAM—COLLINS.—On the 22nd inst., at Bassaleg church, W. L. Winterbotham, M.B. Lond., of Bridgwater, to Rose, second daughter of H. Collins, Esq., of the Duffryn, Newport, Monmouth.

DEATHS.

BRENT.—On the 21st inst., Gdorge Smith Brent, Esq., L.S.A., in his 50th year. Mr. Brent was Deputy-Coroner for the Western Division of Middlesex for many years.

EVANS.—On the 9th inst., at Hertford, Richard D. J. Evans, M.D., youngest son of the late Rev. William Evans, Upton castle, Pembroke.

FENOULHET.—On the 3rd ult., Andrew Chadwick Fenoulhet, Esq., M.R.C.S., Medical Officer of the Wyke Regis District, Dorset, aged 42.

KING.—On the 2nd inst., off Madeira, on his passage to England, Assistant-Surgeon Alfred King, R.N., invalided from the 'Isis' depôt ship at Sierra Leone.

SYMES.—On the 3rd inst., at Forster house, Dorchester, Lydia, the wife of J. Gustavus Symes, Esq., M.R.C.S., Medical Superintendent of Dorset County Asylum.

TOMES.—On the 10th inst., at Havering Atte Bower, near Romford, Mrs. Sarah Tomes, relict of the late Francis Tomes, Esq., Surgeon, of St. Aldate's, Oxford, aged 64.

TROTMVN.—On the 21st inst., at Florence, Dr. Trotman, of "Typhoid Fever"

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—A notice appeared in the 'Gazette' of Friday last that the following are the Hospitals and Schools of Surgery and Medicine from which Certificates of Professional Education for the Fellowship will be received for 1862-63:—Hospitals.—London.—St. Bartholomew's, St. Thomas's, Westminster, Guy's, St. George's, London, Middlesex, University College, Charing-cross, King's College; St. Mary's, Paddington. English Provincial.—Bath United Hospital, Bedford General Infirmary; Birmingham—General Hospital, Queen's Hospital; Bristol Infirmary; General Hospital; Cambridge—Addenbrooke's Hospital; Derbyshire General Infirmary, Devon and Exeter Hospital, Gloucester General Infirmary, Hants County Hospital, Hull Infirmary, Kent and Canterbury Hospital, Leeds General Infirmary, Leicester Infirmary; Liverpool—Royal, Infirmary, Northern Hospital, Southern Hospital; Manchester Royal Infirmary, Newcastle-upon-Tyne Infirmary, Norfolk and Norwich Hospital, Northampton General Infirmary, Nottingham General Hospital; Oxford—Radcliffe Infirmary; Salisbury General Infirmary, Salop Infirmary, Sheffield General Infirmary, Staffordshire General Infirmary, Sussex County Hospital, Worcester Infirmary. Dublin.—Richmond, Dr. Steevens's, City of Dublin, Mercer's Meath, Jervis street, St. Vincent's, Adelaide. Irish Provincial.—Belfast General Hospital; Cork—North and South Infirmaries; Galway—County Infirmary and Town Hospital. Edinburgh.—Royal Infirmary. Scotch Provincial.—Glasgow Royal Infirmary, Aberdeen Royal Infirmary. Schools.—London.—St. Bartholomew's, St. Thomas's, Guy's, St. George's, London, Middlesex, University College, King's College, Westminster, Charing-cross, Grosvenor place, Kinnerton street, St. Mary's. English Provincial.—Birmingham—Royal School of Medicine and Surgery, Sydenham College; Bristol—Old Park Medical School; Hull and East Riding School of Medicine, Leeds School of Medicine, Liverpool Infirmary School of Medicine, Manchester Royal School of Medicine and Surgery, Newcastle-upon-Tyne College of Medicine, Sheffield Medical Institution, York School of Medicine. Dublin.—Royal College of Surgeons, Trinity College, Apothecaries' Hall, Carmichael School of Medicine, Dublin School of Medicine, Original School of Medicine, Peter street, Cecilia street Medical School, Dr. Steevens's Hospital. Irish Provincial.—The Queen's Colleges of Belfast, Cork, and Galway, the several Schools recognised by the Royal College of Surgeons in Ireland. Edinburgh.—University. Scotch Provincial.—Glasgow University. Aberdeen.—King's College, Marischal College, and University. The several Schools recognised by the Royal College of Surgeons of Edinburgh. Schools and Hospitals in the British Colonies.—The Medical Colleges of Bengal and Madras, the Grant Medical College of Bombay, the Church University of Toronto, Melbourne Hospital, Australia. In Foreign Countries.—Paris, Montpellier, Strasburg, Berlin, Vienna, Heidelburg, Bonn, Göttingen, Wurzburg, Leyden, Liege, Pavia, Pisa, Stockholm, Copenhagen, New York, Philadelphia Harvard University, Boston.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen passed their primary examinations in Anatomy and Physiology at a meeting of the Court of Examiners on the 22nd inst., and, whon eligible, will be admitted to the pass examination:—Edward Charles Anderson; John Baird; Richard Barter; George Bishop Cornish; Frederick Dale; Francis Molineaux Fawcett; George Gill, John Green; George Fox Grosvenor; Samuel Haigh; Richard Jackson; Thomas Langston; Edward Webber Warren Meyrick; John M'Kenzie; Walter Llewellyn Nash; John Pooley; John Pratt; John Prince; Thomas Thyne; Thomas William Wasdale Watson; John Whiteley; James David Charles Whiting; Charles James Wills; Henry Wilson; Joseph Brampton Wright.

The following gentlemen passed their primary examinations on the 23rd inst.:—Walter Thomas Beeby; Archibald Henry Foley Cameron; Charles John Denny; David Evans; Richard Fennelly; John Thomas Jones; Robert Whittington Lowe; Robert Charles Moon; Willian John Ready; George Renton; William Moon Rogers; William John Wey; Ninian Alexander Williamson; John Kendrick Wynne.

The following gentlemen passed their primary examination on the 24th inst.:—Henry Arnott; Charles Handasyde Carver; Fitzherbert Dermott; Edward Drummond; John Henry Edwards; James Mortimer Fuller; George Gregson; James Murray; William Murr Pettinger; Edward Rutherford; George Starling; George Wyatt Sharp; Thomas Arthur Wood.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on the 17th inst.:—Thomas James Biddle, Army Medical Staff H.P.; Thomas Britton, St. Thomas's Hospital; Caleb Samuel Hilton, Trinity square, Borough; George Charles Henry Hitchings, Oriel, Oxford; Robert Conrad Mossman, Davenport; Baynes Reed, Lock Hospital; Henry Waghorn, Soho square.

The following gentlemen also on the same day passed their first examination:—Frederick Henry Alderson, Middlesex Hospital; Charles Beviss, St. George's; George Henry Clifton, Middlesex; Arthur Evershed, Guy's; Owen Grimbly, St. Thomas's; Thomaa Lucas, Middlesex; Frederick Morley, St. George's; Francis Drake Pearce, St. Bartholomew's; John Palmer Way, St. Thomas's; Albert Weaving, Middlesex; Richard Prior Wintle, St. George's.

A NEW STYPTIC has been discovered in the Palla Tibolii, a Javanese plant.

THE USE OF CYDER IN DIABETES.—Several American physicians have recently advocated the use of cyder in diabetes.

ROYAL LONDON OPHTHALMIC HOSPITAL, MOORFIELDS.—It has been resolved to appoint two additional assistant-surgeons to this hospital.

AN UNEXPECTED LEGACY.—The Secretary of the Bristol General Hospital acknowledges the receipt of 450*l.*, part of the tenth of an unexpected legacy.

SISTERS OF CHARITY AS HOSPITAL NURSES.—Several Sisters of Charity have lately passed through Lyons on their way to Marseilles, where they are to embark for Mexico to attend to the hospitals of the army.

VACANCIES.—There is a vacancy for an English physician at Pisa; there is also a vacancy at Florence, caused by the recent death of Dr. Trotman.

RECOGNITION OF THE AMERICAN SURGEONS AS NON-COMBATANTS.—At last this rational procedure has become adopted by both armies. Had it been, truly observes the Editor of the *American Medical Times*, their policy from the commencement of the war, a vast amount of human suffering would have been saved, as the Surgeons would have continued their labours among the wounded, regardless of the immediate results of the battle.

CHARING-CROSS HOSPITAL.—The annual distribution of the Prizes took place on Tuesday, July 22. The following gentlemen were the successful candidates: *Anatomy*—Silver Medal, Mr. Wm. Carter; First Certificate, Mr. Churchill; Second ditto, Mr. Wm. Hayden; Third ditto, Mr. T. C. Wigg; Fourth ditto, Mr. W. H. Cope; Bronze Medal, Mr. Wm. Burt Shorto; Certificate, Mr. H. Willson. *Chemistry*—Silver Medal, Mr. W. B Shorto; Certificate, Mr. Charles Knight. *Surgery*—Silver Medal, Mr. J. H. Simpson; Certificates and Books, Messrs. Fisher and Badcock; Bronze Medal, Mr. H. Willson. *Physiology*—Silver Medal, Mr. Wm. Carter; Bronze Medal, Mr. W. B. Shorto. *Medicine*—Silver Medal, Mr. J. H. Simpson; Certificate, Mr. T. C. Wigg. *Materia Medica*—Silver Medal, Mr. J. H. Simpson; Certificate, Mr. Churchill. *Botany*—Silver Medal, Mr. Wm. Carter; Certificate, Mr. Churchill. *Midwifery*—Silver Medal, Mr. Luke Fisher; First Certificate, Mr. F. C. Skegg; Second ditto, Mr. Badcock. *Forensic Medicine*—Silver Medal, Mr. L. C. Badcock. *Practical Chemistry*—First Certificate, Mr. Simpson; Second ditto, Mr. Churchill.

THE PROFESSOR OF PHYSIOLOGY AT THE UNIVERSITY OF MELBOURNE.—We have great satisfaction in stating that Dr. Halford, Lecturer on Anatomy at the Grosvenor-place School of Medicine, has been appointed Professor of Anatomy, Physiology, and Pathology, at the University of Melbourne. This appointment is of the value of 1,000*l.* a-year; it was in the gift of Professors Owen and Paget.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—The President and Fellows have directed that Dr. Robert Law shall continue to hold the Professorship of the Institutes of Medicine for a further term of seven years.

ATMOSPHERIC TIDES.—M. Mathieu affirms that he has discovered regular tides in the atmosphere precisely analogous to those of the sea, which reduce varieties of temperature to settled rule, by which the weather can be foretold long in advance with scientific accuracy.

ASTLEY COOPER PRIZE.—The triennial prize of 300 guineas has been awarded to Dr. Edwards Crisp, for his essay on the "Anatomy, Physiology, and Pathology of the Human Pancreas." This is the second time that Dr. Crisp has been the successful competitor for the Astley Cooper prize.

Testimonial to John Tomes, Esq., F.R.S.—On the evening of Wednesday, the 16th inst., the friends of Mr. Tomes invited him to a public dinner, in order that they might avail themselves of the opportunity to offer him some slight token of their appreciation of his efforts to promote the advancement of the dental profession. So far back as twenty years, it appears, Mr. Tomes, as a dentist, felt that a legal recognition and qualification were the great desiderata which should be laboured for; and since then he has been zealously and untiringly exerting himself for their accomplishment. Apart from this, however, by his scientific research and published opinions on the subject of Dental Physiology and Surgery, he has won the esteem and admiration of many of his professional brethren both at home and abroad. The establishment of a new degree of Licentiate in Dental Surgery by the Royal College of Surgeons having proved itself to be the consummation so long devoutly wished for, by the fact of so many of the influential dentists in the metropolis and the provinces possessing themselves of it, the occasion was considered opportune for expressing their sense of the value of Mr. Tomes' many and long-continued services. The chair was occupied by S. Cartwright, jun., Esq., M.R.C.S., who, in a highly eulogistic address, recapitulated the valuable and unceasing efforts made by Mr. Tomes, in all directions, for the general good; and gracefully begged his acceptance of the service of plate, which had been most heartily subscribed to by his professional friends. The testimonial consisted of a handsome silver tea and coffee service, together with an elaborate centre-piece, by Garrard, mounted on a stand, and bearing the following inscription—"Presented to John Tomes, Esq., F.R.S., by several of his brother practitioners, in acknowledgement of the many valuable services he has rendered to his profession. July 16th, 1862." This was accompanied an an illuminated list of the subscribers' names on a scroll of vellum. Mr. Tomes, in returning thanks, explained the reasons for his past conduct, and was many times interrupted by long-continued cheering.

The Late Dr. Todd.—A marble statue, by Noble, has been erected in King's College Hospital to the memory of the late Dr. Todd. The Committee of Management have been able, from the liberality of the subscriptions, to continue "the Todd annual prize of a bronze medal and books to the value of four guineas, established by him during his life for proficiency in Clinical Medicine."

Cinchona in Trinidad.—A renewed attempt is being made to plant the cinchona in Trinidad. It has been planted at a height of 2,800 feet above the level of the sea. The soil is of the richest description.

Appointments.—Samuel Browne, L.K.Q.C.P. Irel., M.R.C.S. Eng., Surgeon, R.N., Surgeon to the Belfast General Hospital, and to the Belfast Ophthalmic Institution, has been elected one of the Vice-Presidents of the Ulster Medical Society, Belfast (a Society recently formed by the amalgamation of the Belfast Medical Society and the Belfast Clinical and Pathological Society).—John Davies, Surgeon-Major half-pay, has been elected Surgeon to the Cheltenham and Gloucestershire Ophthalmic Infirmary, *vice* Mr. Jessop, deceased.—John Creery Ferguson, A.M. and M.B. Univ. Trin. Coll. Dub., Hon. F.K.Q.C.P. Irel., Prof. Pract. Med. Q. Coll. Belfast, Examiner in Medicine Q. Univ. Irel., and Physician to the Belfast General Hospital, has been elected President of the Ulster Medical Society.—Dr. William Gordon has been appointed Deputy-Medical Officer for No. 1 Old Swinford District of the Stourbridge Union, Worcestershire.—Henry Graves, A.B. and M.B. Univ. Trin. Coll. Dub., F.R.C.S. Irel., L.M. Dub. Lying-in Hospital, has been elected one of the Vice-Presidents of the Ulster Medical Society.—George Michell, M.R.C.S. Eng. and L.M., L.S.A. Lond., has been elected Public Vaccinator for the Gwennap and Stithiam District of the Redruth Union, Cornwall.—Edward Thomas Newbold, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Macclesfield District, and the Workhouse and Fever Hospital of the Macclesfield Union, Cheshire, *vice* William Loney, M.R.C.S. Eng., L.S.A. Lond., resigned.—Edward Pearl, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer for the Windsor District of the Windsor Union, *vice* Geoffrey Pearl, M.D. St. And., M.R.C.S. Eng., L.S.A. Lond., resigned.—William Scott, M.D. St. And., F.R.C.P. Edin., F.R.C.S. Eng., L.K.Q.C.P. Irel., and L.M., L.M. Anglesey Hosp., has been elected one of the Vice-Presidents of the Ulster Medical Society.—Walter Somerville, M.D., has been appointed successor to the Hon. John Young, M.D., Belize, British Honduras.—Thomas Kennedy Wheeler, M.D. Q. Univ. Irel., L.R.C.S. Edin., L.A.H. Dub., has been elected one of the Vice-Presidents of the Ulster Medical Society.—Edward Williams, M.D., Cantab., has been appointed Hon. Physician to the Asylum for Idiots, Essex Hall, Colchester.—William Wood, M.D., M.R.C.P. Lond., M.R.C.S. Eng., and L.S.A., has been appointed Physician to St. Luke's Hospital, *vice* Dr. Sutherland.—John Cawood Wordsworth, F.R.C.S., Assistant-Surgeon to the Royal London Ophthalmic Hospital, has been appointed Surgeon to that Institution, *vice* Alfred Poland, F.R.C.S., resigned; Timothy Henry Martin, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer for the Worth District of the East Grinstead Union, Sussex, *vice* Thomas Smith, M.R.C.S. Eng., L.S.A. Lond., deceased.—William Paley, M.D. Univ. Lond., M.R.C.S. Eng., L.S.A. Lond., is President elect of the South Midland Branch of the British Medical Association.—Francis Drake Pearce, M.R.C.S. Eng., L.S.A. Lond., has been reappointed Medical Officer and Public Vaccinator for the Charleton District of the Kingsbridge Union, Devonshire.—Daniel Weld Phillips, M.R.C.S. Eng., L.S.A. Lond., has been appointed Vaccinator for the Halesowen District of the Stourbridge Union, Worcestershire, *vice* Charles William Milnes Bloxham, M.R.C.S. Eng., L.S.A. Lond., resigned.—Ewing Whittle, M.D. Univ. Lond. M.R.I.A., M.R.C.S. Eng., has been appointed Lecturer on Medical Jurisprudence at the Liverpool Royal Infirmary School of Medicine, *vice* Francis Ayrton, M.D. St. And., L.R.C.P. Edin., M.R.S.A. Lond., resigned.

The West-Riding Medical Charitable Society.—The anniversary of this valuable institution was held this year at Halifax, in the board-room of the Infirmary, on the 10th instant, where members from many parts of the riding assembled. After despatching the business of the society, and disbursing between 300*l.* and 400*l.* to sixteen needy annuitant widows and orphan children, the members dined together at the White Swan Hotel, where ample provision was made for their reception. Drs. Kenny and Alexander presided, and the Rev. Mr. Bagot (in the absence of Archdeacon Musgrave) officiated as chaplain.

APPOINTMENTS FOR THE WEEK.

Wednesday, July 30.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopœdic Hospital, 2 p.m.

Thursday, July 31.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

London Surgical Home.—*Operations:* 2 p.m. Ruptured Perinæum; Vesico-Vaginal Fistula.

Friday, August 1.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, August 2.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital, 2 p.m.

Monday, August 4.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, August 5.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

Lectures on the Principles and Practice of Midwifery. By E. W. Murphy, A.M., M.D., &c. Second Edition, Enlarged and Revised. London: Walton and Maberly, Upper Gower street.

NOTICES TO CORRESPONDENTS.

Querist writes, "Pray Mr. Editor, do have mercy upon my ignorance. I was never so humbled in my life as when I read some articles the other day by a celebrated eye doctor, and must confess to you that I might as well have read Chinese. Pray Sir, what is the meaning of 'hypermetropia,' 'amblyopic myopia,' 'asthenopia,' 'mydriasis,' 'nyctalopia,' &c., &c., &c.? The fact is Sir, that I am only a hard-working country doctor, and when I was a student these phrases were not in fashion. Again, Mr. Editor, I must beg the favour of your translating for me a little book published by a Dr. Soelberg Wells, which seems to be a learned combination of fluxions, algebra, and moonshine. A pupil of mine has taken the pains to translate a page of it, and says that it contains the discoveries of some great ophthalmological *quidnunc* called Donders, about short-sight, and long-sight, and no sight at all. I fear Dr. Soelberg Wells was 'taking a sight' of the Profession when he published it. I know that for the future I shall take a very long sight at his book. Excuse the trouble I give you, &c."

M.R.C.S. Eng.—1st. It is quite true that the Council may, if they please, elect a member of the Court of Examiners from among the Fellows; but they have never done so; and it is a triumph to get them to elect one who was not a Hospital Surgeon. 2nd. Yes. 3rd. The charter already gives the power; you know the adage,—you may take a horse to the water, but you cannot make him drink.

Dr. Ellis is thanked for his note.

Dr. Bird.—Received.

Mr. Watson.—Note with enclosures received, and shall be attended to.

Chirurgus (Manchester.)—We do not think the present moment opportune; but the subject shall not be lost sight of.

Mr. Roberts.—Certainly.

T. H.—The "wild-thyme" has been introduced for the cure of whooping-cough by M. Joset, who says that it acts like a charm in that disease. It is given in the form of a concentrated infusion, slightly sweetened, and may be taken ad libitum. It is a favourite secret remedy.

L.A.C.—The agreement is binding upon both parties, in the sense indicated.

Mr. Ewington.—Note received, and shall be attended to.

Mr. Wordsworth.—Received.

Mr. Sheffield.—Note forwarded.

Dr. Gason.—Subscription received, and receipt forwarded to the Rev. Mr. Ince.

To the Editor of the Medical Circular.

Sir,—I forward you a continuation of my correspondence with the Poor-law Board, inserted in the Circular of the 15th inst., which you are at liberty to publish if you think it worth while to do so. I think that most people, if they were aware of it, would be astonished at the quantity of "small beer chronicled" in the books of Medical Officers of Unions, in the shape of the names, ages, residences, and occupations, together with the rise, progress, and duration of illness, method of cure, &c., &c., &c., of multitudes of poor old folks afflicted with chronic rheumatism, or bronchitis, *et id genus omne* of uninteresting and unin-

structive ailments. Of these piles of useless lumber, it may be truly said, "full many a case is never re(a)d at all, and wastes its sweetness on the dusty shelves." Your obedient servant,

Ludlow, July 22, 1862. H. MEYMOTT.

(COPY.—No. 3.)

Poor-law Board, July 17, 1862.

SIR,—I am directed by the Poor-law Board to acknowledge the receipt of your letter of the 9th inst., in reference to the imperfections reported by the district auditor on his examination of your portion of the Workhouse Medical relief book of the Ludlow Union, for the year ended at Lady-day last.

I am directed to state that the Board consider it necessary that the initials of the Medical Officer in attendance, should be entered in every case, and that you should note in the appropriate column the number of the dietary, on which a person is placed each day. I am directed to add that the Board entertain no doubt that your attention having been called to the subject, you will adopt this course in future.

I am Sir, Your obedient servant,

Henry Meymott, Esq., Medical Officer of the Workhouse of the Ludlow Union, Ludlow. H. FLEMING, Sec.

No. 4.

Ludlow, July 21, 1862.

SIR,—In making the following remonstrance in reply to your letter of the 17th inst., I beg leave distinctly to disclaim any hostility to the authority of the Poor-law Board, as well as any deliberate intention of refusing to comply with its reasonable requirements, and to express my desire of approaching the Board with all that respect which its members can so justly claim from their high position, and the important duties they are called upon to fulfil.

With this proviso I venture first of all to take it for granted that the main, if not the sole object of the Board in the discharge of its functions is "efficient relief to the Poor."

In the next place I submit that the scriptural statement relative to the Divine law, "the letter killeth, but the Spirit giveth life," is in principle applicable to human laws, and as it affects the Poor-law, I contend that a constant and unvarying attention to minute statements and unnecessary repetition in written reports, tends to vex and harass the mind of the Medical officer whilst in the discharge of his duties to the sick poor, and *quantum valeat*, defeats the object he has in view. I have long been of opinion that the Medical officers of Unions are encumbered in their arduous, harassing, and inadequately paid services, by the large amount of expensive, and useless book-keeping which falls to their lot; and, I believe that I am far from being singular in this opinion.

I now proceed to the consideration of the particular points at issue. I am utterly at a loss to conceive any utility, practical or otherwise, in the Medical officer appending his initials to the cases on the Workhouse Medical Relief Book. If it be to register the amount of attendance on the sick poor, this is already doubly done: first, in the entry of each visit in the porter's book; and secondly, in the recorded answers to the questions of the House Committee in their periodical visits. Besides these tests, there is an express column for the entry of every attendance as an authenticity of the ordered diet or reported visit—it is simply superfluous. The other point complained of by Mr. Roberts is the non-filling up every day of the column for the dietary. In addition to the remarks on this head in my previous letter, I have to state that I frequently avail myself of the empty spaces to put down the particulars of any extra diet required, in consequence of the small amount of space allotted specially for it. The matron is thus facilitated in carrying out my directions. This I could not do without considerable crowding and probable confusion, if the number of the dietary were put down daily, and I am informed by the master that his calculation of the dietary would not in the slightest degree be assisted by my so doing.

Again, if the extra diet, which is of more importance than the ordinary diet, is also to be put down each day, a fresh form of book, of much larger dimensions, would be absolutely necessary. Moreover, it very frequently happens that I am prevented from visiting the workhouse, which is a considerable distance from my residence, till the after part of the day, when an entry of the day's dietary would be useless; and on the days when no visit is made (for when there are no cases of acute disease in the sick wards a daily visit is not needed), the dietary would be at a complete standstill.

In conclusion, I would remark that, previous to Mr. Roberts's casual audit, no complaint has ever been made by the auditors, inspectors, or Board of Guardians, of the manner in which those particular columns have been filled up by myself for fifteen years, and I believe pretty much in the same way by my predecessor, from the commencement of the operation of the Poor-law in this Union, nor has any inconvenience resulted of any kind to any party concerned, much less have the interests of the sick poor been affected by it.

Hoping this practical testimony (founded upon an experience of more than twenty years) of the operation of an important branch of the Poor-law, may not be altogether unavailing in causing a relaxation of the stringency of the clerical duties assigned to the Medical officers of Unions. I am, &c., H. MEYMOTT.

H. Fleming, Esq., Secretary to the Poor-law Board, Whitehall.

To the Editor of the Medical Circular.

SIR,—I suppose that it is almost superfluous to tell you that the "papers" you have recently published on "Laryngoscopy," by Mr. Yearsley, have given a new and high degree of interest to your valuable journal, and that on a subject previously but little understood by the mass of the profession in England. I do not think that it is too much to say, that in the amount of information, the clearness of the narrative, and the thorough mastery of the subject, these papers have not been equalled, and certainly not excelled, by anything that has appeared in the pages of the medical press of England for the last quarter of a century. The Profession previously owed a deep debt of gratitude to Mr. Yearsley, which these papers have still further increased. Their publication induces a hope among the readers of your paper in this neighbourhood, that that gentleman will now, more frequently than heretofore, enrich your columns with contributions on the special departments of surgery and medicine to which he has so long and so successfully devoted his attention. I do very sincerely hope he will be able to occasionally find time thus to instruct and gratify your numerous readers. There is one allusion in his recent papers which has greatly arrested my attention; and that is, the absence of "nasal breathing" as symptomatic of certain affections of the throat and ear. I should much like to have his opinions and experience on the effects of "smoking" and "snuffing" on these organs. Were he to favour us with a short paper on each of these "vices," in their connection with throat-disease and deafness, I am sure they would be read with avidity, not merely by the Profession, but also by the tens of thousands of non-professional readers who weekly peruse your columns, and without doubt, with manifest benefit to all, more especially the last. Pray, Mr. Editor, use your kind offices with Mr. Yearsley, and get him to oblige us *more frequently* with the products of his vigorous and instructive pen.

I am, &c., APORYS.

Taunton Union.—The Board of GUARDIANS of this Union are desirous of receiving applications for the appointment of Medical Officer, (duly qualified), for the West Monkton District, comprising the parishes of Cheddon, Fitzpaine, Creech, St. Michael, Durston, and Monkton West.

Area, 7,222 acres, Population, 2,335; Salary, £75 per annum.

In addition to the salary, the officer will be entitled to the Fees specified in the order of the Poor-Law Commissioners of 24th July, 1847. He will be appointed under the Act for Vaccination, with a fee of 1s. 6d. or 2s. 6d. for every successful operation by him, according to distance, and 2s. 6d. per case for each quarterly visit to lunatic paupers resident in the district.

Information as to the duties, &c., may be known on application to me.

Testimonials of qualification, &c., to be left at my office on or before the 12th August next, and personal attendance at the Taunton Union Workhouse at Noon on the following day (Saturday, the 16th), when the election will be proceeded with, is indispensable.

JOHN CHORLEY, Clerk.

July 19th, 1862, Registry place, Taunton.

Cod Liver Olein, prepared by J. W. N. BREWER, Pharmaceutical Chemist, 5 Liverpool street, Finsbury circus.

This preparation is strongly recommended as containing all the active principles of Cod Liver Oil, without its impurities. Olein will be found to agree with the most delicate stomachs, and in those cases in which Pain, Nausea, or Eructations are produced by the Oil, the Olein is an invaluable substitute.

PHOSPHORIZED COD LIVER OLEIN; THE SYRUPS OF THE HYPOPHOSPHITES AND BIPHOSPHATES, &c. &c.

List of Therapeutic and Special Preparations forwarded on application.

Teeth. — Mr. Ephraim MOSELY'S Recent Improvements are secured by Letters Patent, and consist of a soft base of Prepared India-rubber placed between the Teeth and Gum. It is so natural in colour as to appear part of the soft structure of the mouth, and by its use detection is completely defied, and an amount of comfort afforded the wearer unattainable by the use of any other material.

Mr. MOSELY'S TREATISE, post free 13 stamps, fully explains his Inventions.—Robert Hardwicke, 192 Piccadilly; and the Author, 9 Grosvenor street, Grosvenor square.

TO THE MEDICAL PROFESSION.

Charcoal Biscuits, manufactured from the purest Vegetable Carbon. Sold only in tins, at 1s., 2s., 4s., and 8s. each, by J. L. BRAGG, Sole Manufacturer, 2 Wigmore street, Cavendish square, London.

Chemists and others allowed a liberal discount.

Post-office Orders made payable at the Old Cavendish-street Branch.

Life for the Consumptive.

One Tablespoonful of the PATENT OZONIZED COD LIVER OIL, three times a day, conveys artificially to the Lungs of the Consumptive and Delicate, the vital properties of Oxygen, without the effort of inhalation, and has the wonderful effect of reducing the pulse while it strengthens the system. The highest Medical authorities pronounce it the nearest approach to a specific for Consumption yet discovered—in fact, it will restore to health when all other remedies fail. See 'Lancet,' March 9, 1861.

Sold by all Chemists, in 2s. 6d., 4s. 9d. and 9s. Bottles. Wholesale by G. BORWICK, Sole Licensee, 21 Little Moorfields London.

Lithographic Printing by STEAM.—J. CROSS and SON execute in a superior style, on very moderate terms, every description of Commercial Lithography, Steel, and Copper-plate Engraving and Printing. Contracts with large consumers. Wedding and Visiting Cards, Invitation Notes, Envelopes, and every description of Fancy Stationery.—J. CROSS and SON, Lithographers, Engravers, Steam-machine Printers, and Stationers, 18 Holborn hill, E.C. Established 1813.—Works, Baldwin's gardens.

Messrs. Nicholson and Co., Wholesale Chemists, 5 Dean street, Oxford street, London, Sole Agents for KEITH and CO.'S CONCENTRATED ORGANIC REMEDIES; also, the New Work by GROVER COE., M.D., being a Practical Exposition of the Therapeutical Properties and Clinical Employment of these invaluable preparations.

Sole Original Makers of the LIQ. COPAIBÆ c. BUCHU et CUBEBÆ, miscible with distilled water, clear and does not nauseate. LIQ. ANTIPSORIC,—a perfect specific for Scabies, without any smell of sulphur. LIQ. ERGOTÆ never fails, and equal in strength to the powder. Ozonized Ol. Jecoris Opt., only 1s. 9d. per lb.

All the New Remedies, Concentrated Infusions, etc.

King's Effervescent Citrate of MAGNESIA is the original Preparation for which the Proprietor received a Medal at the Great Exhibition in 1851, and has had the sanction and recommendation of the most eminent Physicians in London, and throughout the empire, for the last fifteen years, as a most agreeable and efficacious Saline aperient and Febrifuge, suitable for all ages and all climates. Testimonials accompany each bottle. Sold by all Chemists.—W. W. KING, Sole Proprietor, 15 Percy street, W.

Practical Medicine and Surgery.

ART. 6259.

Hygiene of Railways.—Further remarks on Intermarriage between Relatives.—Tobacco-smoke a cause of Angina Pectoris.—Debate on the Origin of Vaccine Matter.

Dr. Gallard, Physician to the Orleans Railway Company, recently laid before the Academy of Sciences the medical returns of his professional experience, during the last four years, on this important line. We gladly reproduce a portion of the author's remarks on the diseases prevalent among the persons employed, and on the new hygienic conditions required by this mode of locomotion for the staff of the institution, the travellers, and the inhabitants of the countries crossed by railroads.

Enginemen and stokers were, *à priori*, conceived to be especially liable to particular diseases. Mr. Gallard agrees with his predecessor, Dr. Bisson, that this class of men presents no tendency to any special affection of the nervous or of any other system, consequent on the inhalation of oxide of carbon, or on the trepidation of the engine. The guards and brakesmen, on the contrary, are more subject than the stokers and enginemen to inflammation of the respiratory organs. This circumstance is referred by Mr. Gallard to the fact that while the train is in motion, these men are, from the nature of their duties, less actively engaged, and, therefore, suffer more from the cold than the stokers and enginemen, who must stand and exert themselves in working the locomotive. For the last few years, these officials have been authorised to take, during the cold season, at each refreshment-room—*i. e.*, every two hours, at least, a cup of some warm beverage, such as milk, soup, or coffee; this measure, by increasing their power of resistance to the effects of cold, has much contributed to lessen the average of cases of illness, which has thus been reduced from 108 to 72 per cent.

Means of various kinds have also been resorted to with success, for the purpose of diminishing the number of cases of intermittent fever among the agents dispersed along the line worked by the Orleans Company. This object was attained in the first place by the drainage of the marshy lands situated along the track of the railroad, an operation equally beneficial to the inhabitants of these localities, and to the agents of the Company; in the second place, other measures were prescribed, entirely personal to these individuals, and consisting chiefly in regulations calculated to increase their power of resistance to the surrounding pathogenic influences.

During the last overflow of the Loire, almost all the ditches from Blois to Nantes were filled with water which, having no outlet, converted them into marshes. The Company drained those in which the measure was practicable; the others were cleansed, their margins perpendicularly cut, the aquatic plants removed, and they were thus transmuted into fish-ponds, which have ceased to emit any poisonous effluvia.

Wherever these works of public utility have been undertaken, they have been productive of the most beneficial results, and engineers, now fully aware of the perils of the stagnation of water in ditches, use their utmost endeavours to avert them. On the newly-constructed lines, instead of excavating the road at the sides, they extract from the neighbouring hills the materials necessary for the embankments. If no hills are to be found at a convenient distance, and dikes are indispensable, they are not sunk in the vicinity of the dwellings of the inhabitants, or near those localities in which the erection of station-houses is contemplated, as these trenches are speedily converted by the accumulation of rain-water into miry and dangerous marshes.

To suppress marshes would obviously be the most effective method for the extinction of intermittent fever; this forcible measure is not, however, always practicable, and companies, despite their most strenuous efforts will never succeed in affording to their agents absolute protection against the pernicious effects of paludal miasmata. The most that can be done is to increase, as much as possible, the power of resistance in those individuals who cannot entirely be removed from the morbid influence in question, and who must perforce reside in a locality in which ague is endemically prevalent. Care has, therefore, been taken that they should be comfortably housed and clad; provisions of excellent quality, at a very low rate, are furnished, and during the warm season a beverage is supplied which has exercised the most beneficial effects on the health of the persons employed.

Journeymen who, during the summer, work in the open air, perspire copiously and require frequently to slake their thirst. If water only is at hand, they drink immoderately, and the diseases consequent on this abuse are so frequent as to attract the attention even of the least observant. In many workyards, therefore, and in most farms, a certain quantity of vinegar, or what is preferable—brandy, is mixed with the water supplied to the labourers. Dr. Bisson, who has done much towards improving the sanitary condition of the operatives employed on the Orleans Railway, conceiving that this plan might be improved on, caused the following liquid to be regularly served out to the men:—

Infusion of coffee, 3 pints;
Rum or brandy, 2 pints;
Brown sugar, 1 pound;
Water, 10 gallons.

This slightly tonic beverage, says Mr. Gallard, has unquestionably proved most serviceable; the men drink it with pleasure, even at their meals, and they doubtless owe to its use immunity from colic, diarrhœa, and dysentery. During the cholera, it was found especially beneficial. It was, however, soon discovered that this compound could not be supplied with the same advantage to workmen engaged at some distance down the line, as to those employed at the stations. It ferments easily, does not keep beyond twenty-four hours, and can be distributed only when entirely prepared, because if each man's allowance was served out in a concentrated form—*i. e.*, before the addition of water, it is to be feared that such addition would often be omitted. It was, therefore, necessary to discover a preparation not liable to ferment, and sufficiently concentrated to admit of being conveyed in a small volume to the labourers, to be afterwards mixed by themselves with water from the springs adjacent to the workyards. Various experiments were made with liquids containing tincture of cinchona bark, or sulphate of quinine, both selected on account of their known influence on ague, and the following preparation has been found decidedly the most useful, and is now definitively adopted:—

Rum or brandy, 10 drachms;
Tincture of gentian, 1 drachm;
Water, 4 pints or more.

The men promptly become accustomed to this beverage, and Mr. Gallard attributes to its use the considerable diminution observed in the prevalence of ague amongst the labourers of the Orleans Railway; indeed, the decrease has been more marked among the journeymen employed on the line to whom this fluid has been served out, than among the others who have continued to receive the infusion of coffee.

In certain excessively insalubrious districts, hygienic precautions of a different nature have been adopted, with the most satisfactory results. At Guétin and at Rochefort, for instance, the workmen receive a daily allowance of coffee and brandy; the men who have suffered much from ague, and whose system cannot become seasoned, are removed and replaced by young and vigorous individuals, as far as practicable, chosen amongst those who, having no family, are, therefore, enabled to live better and support their strength, any loss of which would lay them open to the inroads of paludal intoxication.

Railways have, it is true, been the scenes of dreadful catastrophes, which are still painfully present to all minds, but daily experience shows that, thanks to improved machinery, careful superintendence, and able management, no system of

locomotion affords equal security, if the number of travellers be considered. Setting apart, therefore, the question of actual danger, querulous persons lay much stress on petty annoyances, which they consider inherent in this mode of conveyance; these may easily be attenuated. Thus some passengers complain that they cannot read in the carriages with any degree of attention, without much fatigue. Mr. Gallard agrees with Mr. de Piétra-Santa, in recommending such persons to close their book every ten minutes, and to repose their sight by inspection of the landscape; after a short interval of rest, they can resume their occupation without suffering inconvenience. The trepidation of the trains has also been considered as a cause of abortion and premature labour. This imputation is of greater importance, but with regard to abortion, does not appear to be borne out by facts; premature labour would be more readily accounted for. But if it be really, indueed, by the motion of trains, railways are certainly not more distinctly open to the reproach than common carriages drawn by horses. Altogether the imputations urged against railways, as far as regards the comfort of the passengers, are so futile as to be utterly undeserving of notice. Less fatigue is unquestionably encountered than in any other mode of conveyance, and the arrangements for invalids, are such as could never have been supplied in equal perfection before the invention of the locomotive engine.

Mr. Gallard concludes with an enumeration of the advantages conferred by railways on the population of the districts traversed by the lines. Their benefits in a hygienic and commercial point of view, are beyond all question, and these wonderful agents of communication, besides the immense services rendered to civilisation, may fairly be considered as disseminators of activity, comfort, health and life.

— We are acquainted with several instances of intermarriage between relations, the consequences of which have been so perfectly happy, that we entertain with some reluctance the question brought before the Academy of Sciences, by Mr. Boudin, in a paper which is a complete bill of indictmen against consanguineous unions. The subject has of late ent gaged a considerable share of attention. Some few weeks, since, Mr. Francis Devay published a work entitled *Perils of Consanguineous Unions*, in which the following passage occurs: "The question discussed in the present volume, is circumscribed in its terms; but its immediate results, and its connection with momentous points relative to marriage, hereditary disease, and the improvement of the human race, invest it with a considerable degree of importance, as one of the numerous aspects of social hygiene, and the science of the future. None can view with indifference the weighty interests involved in the solution of the problem, none can refuse to bestow on its elucidation the amount of thought and inquiry it deserves. It presents equal interest in its bearings on philosophical, medical, or social science."

Mr. Devay does not deny, that in some cases, intermarriage between relations has proved innocuous. "I am perfectly aware," says he, "that the marriages to which I object, have sometimes produced healthy and prosperous families; but these are mere exceptions, and it would be rash to trust to circumstances beyond our control. If the astounding frequency of deaf-muteness were the only argument brought forward to demonstrate the perils of consanguineous unions, it would, in our opinion, constitute a most valid objection."

Congenital deaf-muteness is, we must acknowledge, one of the most frequent consequences observed in the offspring of relations united in the bonds of matrimony. Since the year 1858, Mr. Devay has, in thirty instances, observed the coincidence, which Mr. Ménière had distinctly and repeatedly pointed out. Mr. Chazarain, of Bordeaux, states, that in the Deaf and Dumb Institution of that city, he found that six out of thirty-nine boys, and nine out of twenty-seven girls, were the offspring of consanguineous unions. Two of the boys had between them, five deaf and dumb brothers, and six of the girls had between them, seven brothers or sisters afflicted in the same manner. At Lyons, Mr. Perrin has ascertained that, one quarter at least of the inmates of the Deaf and Dumb Asylum were the children of married relatives, and in the Asylum of Ainay, about one-fourth of the deaf mutes acknowledge a similar origin.

Mr. Boudin's communication rests upon these and other figures. He shows that the proportion of congenital cases of deaf-muteness consequent on consanguineous intermarriages, compared with the aggregate number of persons so afflicted from their birth, is in Paris, 28 at Lyons 25, and at Bordeaux 30 per cent. He further demonstrates that the fatal influence exercised by the relationship of the parents is not confined to their immediate progeny, and that deaf and dumb children are sometimes the result of unions in which one of the parties is the issue of a consanguineous marriage.

Mr. Boudin, adopting the same view as Mr. Devay, investigates the subject with regard to climate and religious persuasions, and establishes, on comparative estimates, that in 10,000 inhabitants the number of deaf and dumb individuals is in Paris 2, in Corsica 14, in the Hautes-Alpes 23, in the Canton of Berne 28—*i. e.*, the proportion rises with the difficulties of exterior communication; in other words, with the increase of the number of consanguineous unions.

With regard to religious persuasions, the following are the statistics drawn up at Berlin:

3·1	deafmutes in	10,000 Roman Catholics.
6·0	„	10,000 Christians, chiefly Protestants.
2·7	„	10,000 Jews.

From these data, Mr. Boudin infers that the proportion of cases of congenital deaf-muteness increases, in direct ratio with the facilities accorded to consanguineous union, by the different forms of worship.

These are not the only disastrous consequences of intermarriage between relatives. It has also been considered as the cause of barrenness and abortion in the parents, and in children of epilepsy, albinism, idiocy, insanity, pigmental retinitis, and other infirmities, amongst which Mr. Devay notes polydactylism in 17 out of 121 marriages.

Mr. Boudin cautiously avoids expressing any absolute opinion as to the ætiology of these numerous affections, and appeals to statistics to supply adequate proof of an influence which canon law, and philosophical induction incline to view in the same light.

— We shall take an early opportunity of referring to Mr. Beau's ideas on the pathology of *Angina pectoris*. We may, however, in anticipation, state that this careful and ingenious observer conceives that the fumes of tobacco have an important share in the production of the disease.

Amongst the numerous bad effects induced by the immoderate use of tobacco, we must note vertigo, granular angina, dyspepsia, and a form of cough attended with loss of flesh, closely resembling the cough and emaciation of tuberculosis. To this list, Mr. Beau now adds *angina pectoris*. Our readers will find at our Art. *Learned Societies*, the eight cases illustrative of the injurious agency pointed out by the author, in an interesting paper communicated to the Academy of Sciences. These facts acquire additional value from their entire concordance with Mr. C. Bernard's experiments on nicotine, and seem to prove the truth of the doctrine, which views angina pectoris as a functional disease of the muscular structures of the heart, spreading to the thorax, neck, and upper extremities.

Mr. Bernard has satisfactorily established that nicotine is a poisonous alkaloid, not inferior in power to prussic acid, although acting in a different manner, and chiefly affects the nerves, muscles, and more especially the vascular system. In large doses, this substance induces spasmodic muscular action, which may acquire a permanent tetanic character, whereas if the quantity absorbed is small, the lungs and heart are affected in the first place, the respiratory movements becoming more frequent, and the action of the heart being likewise increased. None of these phenomena occur when the pneumogastric nerve is divided, a palpable proof that this complex action is transmitted by the nerves. We should not omit to state that the muscular system is thus affected, only when the nicotine is pure and in sufficient quantity, but that the lungs and heart specially resent its action, when the poison is diluted or imperfectly prepared.

Mr. Beau has forestalled the objection which would naturally suggest itself to his interpretation, from the observation of cases of angina pectoris in persons who have never used tobacco in any shape. He does not venture to assert that immoderate smoking is the only cause of the disease; he, on the contrary, acknowledges that the causes of this complaint are manifold, and points out one, which seems to have been hitherto overlooked. He further remarks that angina pectoris would be produced in smokers, only by a combination of circumstances seldom to be met with: 1. The immoderate use of tobacco. 2. A special susceptibility of the system. 3. The action of debilitating causes, such as grief, excessive fatigue, considerable diminution of the digestive powers, &c., which would interfere with the elimination of the particles absorbed, and allow of its accumulation in sufficient quantities to affect the muscular structures of the heart.

— We recorded in a former number of the present Journal, (Art. 5850) a series of experiments instituted at Toulouse, from which it appears that genuine vaccine virus may be supplied by the legs of the horse. The Toulouse experimentalists agree in this respect with Jenner, who, it may not generally be known, conceived that vaccine matter originated in the horse. "If you meet," said he, "with *cow-pox* in a drove of cows, be certain that it has been communicated by men who previously had groomed horses affected with the disorder termed *grease*." At one period of his life, Jenner maintained that grease, in order fully to acquire its anti-variolic virtues, should in the first place be transmitted to cows; at another period, he declared that this intermediate passage was unnecessary, and he died at last with the conviction that cow-pox originated in a primary and invariable manner in the foot of the horse, whence it was propagated to the cow by the process of contagion.

It would appear at first sight easy, by substituting experiment for observation, and artificial for fortuitous inoculation, to test the correctness of the opinions of Jenner, who was himself perfectly aware that experiment here was of far greater value than mere observation. In his day, however, the method was not in vogue, and he resorted to it once only, in order to support his doctrine on scientific demonstration; this attempt failed, but in no wise altered his conviction. Since Jenner, many expert operators have inoculated *grease*, but the results have been so conflicting that, even now, several sagacious inquirers remain in doubt whether cow-pox originates from the horse or from the cow, and uncertainty prevails as to the connection of vaccine with variola, and to this day it is an unsettled point, whether it is to be regarded as a transformation or an attenuation of small-pox.

The subject is obviously one of much interest, and will doubtless engage the attention of the Professor recently appointed to the chair of Comparative Medicine. Trusting that Mr. Rayer may soon shed on this obscure question the illuminating rays he has somewhat too long kept in reserve, we may briefly summarize the debate which arose at the Academy of Medicine, after the communication of a substantial and elaborate report by Mr. Bousquet on the facts related by Mr. Lafosse and the other Toulouse experimentalists.

Messrs. Maunoury and Pichot already, some time since, distinctly recognised the presence of genuine cow-pox pustules on the fingers of B——, a farrier, who had shod a horse affected with *grease*. Mr. Lafosse and his colleagues, on the other hand, inoculated to cows a fluid supplied by a disease which they also denominate grease, and *cow-pox* was the result. All have inoculated in children the virus secreted by these pustules, and a legitimate and well-characterised vaccinal eruption was produced. The discussion bore upon these facts, which are confirmative of Jenner's opinions.

According to Mr. Bousquet, the facts observed in 1836, incomplete and unsatisfactory as they may be deemed in some respects, are nevertheless extremely valuable; but they are far surpassed in interest by the experiments performed at Toulouse. These would constitute, in the able reporter's estimation, a scientific event of the highest order, and perhaps inaugurate a new era in the history of vaccination. They are in all respects conclusive. The disease of the horse was seen by the most competent veterinary surgeons; it was not fortuitously communicated, but was carefully inoculated and watched in all its transformations, from the first puncture with the lancet to the fullest evolution. What more is required to bestow on it its true name?

We reproduce *verbatim* Mr. Bousquet's remarks:

"The novelty of the disease being a legitimate cause of suspicion, in my eyes," said the learned member, "I received it with distrust and caution, and carefully inquired into each separate cause of possible error. In the first place, I endeavoured to ascertain if the lancets used had ever before been employed in vaccination; this was of course highly improbable in a school of comparative medicine. I wrote, however, to Mr. Lafosse on the subject, and was informed that the lancets had never been used for that operation. I inoculated on one day twelve cows or heifers, and in all, vaccinal pustules resulted. It is unnecessary to allude more at length to the motives which guided me in these experiments; I may confine myself to the statement that all the animals returned the vaccine matter as it had been imparted, neither more nor less active; instead of which, the virus supplied by the pasterns of Mr. Corail's mare produced pustules much superior to those resulting from common vaccine virus. The workman is known by his work, the nature of the fruit betrays the tree which bore it.

"It has been in the second place, alleged that in the cow inoculated, spontaneous cow-pox was perhaps on the eve of breaking out. I must own that this singular argument never occurred to me. Cow-pox has not, all of a sudden, become so very common, that its appearance may always be impending. The pustules, moreover, formed in the punctured spots, and all progressed in a manner exactly corresponding to the date of the successive inoculations. This perfect regularity does not accord with the idea of a spontaneous, natural eruption.

"These suppositions being disposed of, another argument arises, invested with a greater degree of probability, although not with the merit of novelty. At the very earliest period of the history of vaccination, Turner objected to Jenner, in 1779, that vaccine was naught but small-pox, transmitted to the cow by the hands of the persons engaged in milking. Can we consider the epizooty at Rennes as an epidemic of small-pox?

"As a previous question, we may here inquire whether the horse is liable to be affected with small-pox. The most expert veterinary surgeons are silent on the subject; and yet I am informed that the idea occurred to Mr. Lafosse, and that he tested its value by direct experiment. Cases of small-pox having occurred among the pupils, he inoculated the disease in horses, but with negative results.

"Although the distemper observed at Rennes, although cow-pox, and vaccine are not identical with variola, they are closely analogons, and the resemblance supplies us with a clue to the mystery, and we must consider it but natural that analogous or equivalent quantities should neutralise each other.

"At any rate, it seems unreasonable to argue that a disease which has reproduced vaccine does not contain its germ. I do not, however, attempt to draw from the fact any but its legitimate inferences; and, although vaccine pustules were produced by the inoculations related, I guardedly avoid asserting that the disease is always transmitted from the horse to the cow; I believe it arises in general, on the contrary, spontaneously in the cow. Too many instances are on record of cow-pox observed in cows, when no communication with horses could possibly have taken place, to justify us in coming to any other conclusion.

"The cow and horse would, therefore, both appear capable of generating the vaccine-virus. This is a lesson taught us by observation; but the cow has the advantage of greater notoriety. We cannot but regret that Mr. Sarrans, who lived on the spot, and Mr. Lafosse, who, unfortunately, resides at a distance from the locality where the disease broke out, did not take advantage of all the favours of fortune to multiply the inoculation. Nothing is better calculated to throw light on an extraordinary circumstance than the repetition of the same fact. Unquestionably, all the negative experiments that can possibly be addueed, whatever their number, cannot annul a single positive, well-ascertained fact; but, when an occurrence is unusual and meets with contradiction, illusion is always to be apprehended, and a satisfactory conclusion can arise but from more extended inquiry."

Several members addressed the Academy after Mr. Bousquet. Messrs. Bouley, Depaul, Leblanc, and Reynal, expressed conflicting opinions: Messrs. Bouley and Reynal agree with Jenner, and conceive that the vaccine-virus originates in the horse; Mr. Leblanc, on the contrary, maintains that it is first generated by the cow. Mr. Depaul endeavoured to show that the disease called grease (*Eaux aux jambes*), can communicate vaccine neither to the equine nor to the human subject, that such transmission has not been demonstrated by observation or experiment, that the horse is liable to be affected with small-pox, and that vaccine and variola are identical in their nature. Mr. Depaul opines that vaccine is naught but small-pox inoculated to animals, producing cow-pox in oxen, and the rot in sheep. The Academy, in this conflict of opinions, would doubtless have experienced much difficulty in coming to any conclusion, had not Mr. Reynal, by an excellent description of the disease called grease, thrown light on the mysterious generation of vaccine virus, and reconciled the dissentient views of the matter.

"Veterinary pathology" said Mr. Reynal, "acknowledges the existence of several diseases, which, in their progress, assume types of so

different a character, that a superficial observer might be inclined to consider them as belonging to distinct genera. Nothing, for instance, can be more dissimilar to all appearance, than genuine glanders, and glanders attended with eruption on the integuments of the face. The earlier and later stages of the disease of the horse termed Anasarca, differ so widely as to constitute to an unpractised eye separate affections. The same remark applies to *grease* (eaux aux jambes ;) it suddenly alters its characters so considerably that the malady, in its third stage, seems perfectly distinct from that which the animal suffered from in the first period. This observation is so strictly true, that, unless the veterinary surgeon has from long experience acquired a knowledge of the concatenation of the symptoms, he is liable to commit grievous error in his diagnosis.

"At its onset, grease is ushered in by swelling of the pasterns, which rapidly extends to the middle region of the metacarpus or metatarsus, and may even involve the knee or hock ; this condition is preceded and accompanied by feverishness. The swelled part is hot and tender, and soon becomes the seat of a serous exudation which moistens the hair; this secretion is occasionally so copious as to run in droplets over the hoof. Vesicles distended with a yellowish, pungent, and transparent fluid form beneath the cuticle, and are followed by more or less superficial ulceration, which supplies a copious and thicker matter. Here and there in the fold of the pastern appear pustules of various size, from which emanates a serous liquid which speedily becomes yellowish, puriform, and more consistent. The intervals between the pustules are filled by a coagulated substance analogous to gelatine, and the hairs are turned back, and adhere to each other in small clusters. During this stage, the skin is frequently chapped, exfoliated, and occasionally mortified.

"A circumstance deserving of notice shows that these anatomical changes are but the local expression of a general morbid condition ; the feverishness subsides and vanishes, as soon as the disease becomes localised in the extremities.

"I have chiefly observed this acute form of grease in young horses, in which glanders had been checked in their development.

"In 1840, several horses brought into France through our Eastern frontier for cavalry service became thus affected ; in order to evade the prohibitive laws in force in Germany, the dealers had been obliged to march them long distances through rain, snow, and thaw.

"This variety is common beyond the Rhine, where it is designated as grease with chaps, or gangrenous grease, according as it is complicated by quitters or mortification."

The very considerable changes observed in the symptoms of grease, during its progress, account in Mr. Reynal's opinion, for the confusion of ideas and differences of opinion which prevail with regard to the disease, which generates cow-pox in the horse. This eminent veterinary professor is satisfied that Jenner's grease and sore-heel correspond to the first, the eruptive vesicular or pustular stage of the complaint above-described, the only one capable of transmitting vaccine, and which Mr. Leblanc did not meet with at Toulouse, when he repaired to that city, for the purpose of testing the accuracy of Mr. Lafosse's experiments.

It remains now to inquire whether, as Mr. Depaul supposes, this eruption is identical with small-pox, and if *vaccine* and *variola* are one and the same disease ; it does not seem intelligible, if they are similar to each other, that one virus should, after inoculation, invariably produce a local and the other a general eruption. As to the assimilation of rot and vaccine, science abounds with facts showing the negative result of vaccination in sheep, and its inability to preserve the animals from rot, even when some slight local manifestations are induced by the operation, whereas the matter secreted by the pustules of rot, effectively protects them from that disease. Another circumstance demonstrates, said Mr. Reynal, in concluding his remarks, that cow-pox and rot differ in their nature : rot is very common in sheep, and cow-pox is very seldom met with, even among oxen living within the contagious atmosphere of rot.

The Medical Circular.

REVIEW OF THE PERIODICALS.

The 'Glasgow Medical Journal.' Dr. Scott Orr gives his experience of *Diphtheria*, and relates the particulars of several cases. His treatment was that commonly practised—viz., the local use of a solution of nitrate of silver, with the internal administration of tincture of the sesquichloride of iron. Mr. Samuel Smith discusses the propriety of administering *Aperients after Labour*, having heard that somebody or other, who is unnamed, objected to the practice ; and he decides, after an experimental investigation, in favour of an ounce dose of castor oil. This is an important bit of intelligence ! *On Diabetes*, by Dr. W. R. Hatrick, is a good summary of our knowledge on the subject. Dr. McCall Anderson gives cases illustrative of *Diseases of the Ears*. They are all instances of foreign bodies getting into the external meatus. Dr. Murray contributes a case of *Puerperal Pyemia*, which is interesting in itself, and is well related. The new remedy, the *Veratrum Viride*, is described by Dr. Ephraim Cutter, its introducer. We have on previous occasions made our readers acquainted with the reputed powers of this medicine. It is said to be a simple, arterial sedative, and useful in all cases where it is desirable to control the action of the heart. Dr. Joseph Bell contributes some valuable *Practical Remarks on the Diagnosis and Treatment of Rheumatic Pericarditis and Endocarditis*. He remarks :—

"The first question which arises is, can we cut short these affections ; In answering this query, it is necessary to keep clearly in view the meaning which we attach to the term inflammation. If we confine its signification to the pathological conditions which exist prior to effusion, then I have no hesitation in answering the question in the negative. I do not, however, mean to say that the inflammatory act never becomes suspended prior to the occurrence of effusion ; on the contrary, I believe that the stage of congestion often disappears completely without ending in exudation. But I am of opinion that the diseases under consideration are *never detected sufficiently early*, in order to enable us to employ any plan of treatment by which the primary pathological effects can be removed. In the great majority of cases, effusion has taken place before the disease is discovered ; hence, for practical purposes, it is quite useless to discuss the question of the possibility of cutting short inflammatory action. It is the products of this action which demand our serious consideration, and not the action itself. It is the effusion and its consequences with which we have to contend. I repeat that the controversy regarding the cutting short of inflammatory action becomes devoid of all practical interest, so far, at least, as the treatment of rheumatic cardiac disease is concerned."

Dr. Bell then gives his experience as to the best remedies for removing the effusion. He thinks that depletion, local or general, can be seldom required, unless in a few exceptional cases among robust patients. He also objects to blisters, but of mercury, his sheet-anchor, he remarks :

"The happy results which have followed the use of this remedy in my hands, have led me to place the greatest confidence in its curative power. My experience, therefore, completely agrees with that of Latham, Graves, and others, who have regarded it as the sheet-anchor in the treatment of the diseases in question. I have had again and again the satisfaction of observing the disappearance of every physical symptom, as soon as the mercurial action became manifested on the gums. This result has not been confined to private practice, but has been also witnessed in the wards of the Royal Infirmary by numerous students.

"In the administration of mercury, two circumstances require attention :—1. To be useful it must be employed at the earliest period of the disease, that is, as soon as the physical symptoms become developed. If its exhibition should be delayed until the effusion has undergone alterations, and the fibrine coagulated, then little or no benefit will result ; indeed, under such circumstances, it would be unreasonable to expect success. The therapeutic power which the drug possesses, is to promote the action of the absorbents, but semi-coagulated, or semi-organised fibrine is not amenable to its influence. 2. On these grounds, therefore, I hold that it is necessary to bring the patient under the influence of the mercury as rapidly as possible : we should never forget that if the effusion should become organised, then the patient's doom is sealed ; sooner or later, the diseased valve or the adherent pericardium will lead to death. In such cases, our struggle is not between health and disease, but between life and death. Promptness and energy are imperatively demanded from the medical attendant. His object must be to bring the patient's constitution as rapidly as possible under the mercurial influence. He must, therefore, administer the drug in the manner which is best calculated to secure this effect.

"I have tried various plans in order to produce rapid mercurialization. Calomel given in doses of two or three grains every two or three hours, I have found to act very well. I have given occasionally a large dose of from ten grains to fifteen grains at the commencement, and followed this up by small ones of two or three grains every three or four hours ; this method has also succeeded very well, the action on the gums becoming evident in a short time.

"The following plan, however, I have found much more rapid in

producing the constitutional effect :—I order a drachm of strong mercurial ointment to be made into a suppository, with a little tallow, and inserted into the rectum every eight hours. A full dose of opium should be given about two hours previous to the use of the suppository, in order to secure its retention. I have on some occasions seen the gums becoming tender within twenty-four hours; the time rarely has exceeded two days.

"*Cautions to be observed in the employment of Mercury.*—1st. It is useless to give it when the effusion has existed for a considerable length of time. 2nd. It should not be employed either in patients of a strumous habit, nor in those labouring under albuminuria.

"With these exceptions, I beg to record it as the result of my experience, that mercury has proved in my hand by far the most useful remedy which I have employed in the management of the diseases under consideration—the agent on which every reliance may be placed, in spite of all the objections that have been urged against its utility."

Dr. Bell then combats certain objections that have been alleged to its use, for example :

"1st. It is argued that it often fails to secure removal of the effusion. 2nd. Other agents succeed equally well. 3rd. That it injures the constitution of the patient."

To the first objection, Dr. Bell answers that other remedies sometimes fail too ; to the second that, even admitting it, it does not diminish the value of the mercury, and to the third, that the abuse does not forbid the use. Respecting other remedies, he says :

"*Iodide of Potassium.*—This article I have often employed when I was prevented from using mercury, in consequence of its inadmissability. I have found it beneficial, but to be so it must be given in full doses—viz., from ten to fifteen grains every six or eight hours until its constitutional effects are produced ; after this the dose should be reduced. The ordinary dose of a few grains will avail nothing. Promptitude is everything in the diseases under consideration ; the effusion, if not rapidly absorbed, will soon become consolidated and irremovable, consequently we must give the remedy in a manner calculated to produce both a rapid and decided effect.

"*Stimulants.*—This class of remedies has been strongly recommended by some of the followers of the late Dr. Todd. This eminent physician has published several cases of rheumatic pericarditis treated by the free use of brandy. I fear that the benefits of this plan have been overrated. Stimulants, under certain circumstances, undoubtedly are demanded ; indeed they are the only remedies on which reliance can be placed. The circumstances which demand their use, however, are only of occasional occurrence, and soon disappear.

"I am convinced that by the free use of brandy and wine I have often saved the life of the patient, when labouring under pericarditis. In these cases the pericardium became rapidly filled with effusion, so much so as to push the apex of the heart up above the fifth rib, and otherwise impede its action, so as almost to bring it to a stand-still. Wine, brandy, and whisky, given freely, acted most beneficially in stimulating the heart's action and preventing syncope, until either the organ had got accustomed to the pressure, or some of the fluid had become absorbed. In such cases a most serious temporary evil occurs, and the only way by which its fatal effects can be obviated is by the liberal employment of stimulants ; so soon, however, as this somewhat transient peril has passed away, the stimulation is no longer required. Its aid is only needed to meet a difficulty of great magnitude ; but if this should not take place, or if it has been surmounted, the remedy is unnecessary. This is a very different matter, however, from treating pericarditis by stimulants ; these agents will neither cure the disease nor remove its effects ; they can only assist in maintaining the action of the heart when the amount of the effusion is so great as to impede its motions. Stimulants are, therefore, to be regarded as temporary or occasional remedies ; but, when they are demanded, they are truly precious, and must be employed in quantities capable of maintaining the heart's action.

"Rapid effusion into the pericardium very often takes place, threatening syncope ; indeed sometimes this occurs, and the patient never rallies. Sometimes the slightest exertion, such as getting out of bed, induces this fatal syncope. Consequently we should be most careful to prevent patients labouring under pericardial effusion from making the slightest exertion ; and when feebleness or irregularity of the heart's action is observed, we should without delay order suitable quantities of either brandy or wine, and continue its use until all symptoms of cardiac oppression have disappeared. Such, then, is the position which stimulants should hold in the treatment of pericarditis.

"From the facts and reasonings which I have adduced in this paper, I beg to make the following conclusions :—

"1st. That when the physical symptoms either of pericarditis or endocarditis become manifested in a case of rheumatic fever, we are entitled to infer that these diseases exist, irrespective of the absence of the general or constitutional symptoms which usually attend the idiopathic forms of these diseases.

"2nd. That we are justified in considering that the effects are capable of being removed, and are therefore amenable to treatment.

"3rd. That those remedies which are calculated to remove congestion and promote absorption, form the proper therapeutic agents ; and that of these bleeding, mercury, and iodide of potassium, are among the most powerful and useful.

"4th. That when the action of the heart becomes enfeebled in consequence of effusion into the pericardium, the free use of stimulants becomes absolutely necessary."

Dr. James Morton contributes to the same journal an article on the *Treatment of Varicose Veins by a New and Simple Treatment.* We quote the following :

"The desirability of amending this state of matters forced itself upon me soon after my appointment to the surgical staff of the infirmary, and accordingly I readily seized upon a plan which I learned was practised in the London hospitals, and which in September last I had the good fortune to see put into practice in University College Hospital by Mr. Henry Thompson, from whom also I learned that it had been employed in a great number of cases, and that he had not met with any in which it had been followed by disagreeable consequences.

"In proposing it to my colleagues, it is right to say that more difficulty was expected in obtaining their consent than was actually experienced ; for there existed a strong feeling against any interference with such veins, and an apprehension of dangerous consequences, which I am glad to say we have not yet met with. The operation, as I saw it performed, was that of Velpeau, with the addition of pieces of glass rod placed over the vein under the ligature or twisted suture ; pieces of bougie or elastic catheter may be used instead, and were also used. Instead of placing the patient in the erect posture, as some recommend, a strip of bandage was put round the thigh, sufficiently firmly to cause distension of the veins on its distal side, so as to render them more prominent and more easily distinguished.

"The mode of operating which we adopt is the following, and let me premise that it is not necessary to wait till the ulcers are healed, and, indeed, the healing process seems to be accelerated by the operation :—Chloroform has generally not been used, though in some cases, when the patient is timid, its employment might be judicious ; and in private, when the patients are willing to inhale it, or are anxious for it, we should always administer it. Where it can be dispensed with time is saved, and annoying sickness and vomiting avoided. Some recommend erect posture, as the veins are better seen ; but we have followed the plan of putting a strip of bandage, which may be wet if desired, around the limb, above the space where the veins are to be operated on, and this serves the same purpose by causing dilatation of the veins, so that they are easily perceived and their outline defined. The needle is then passed under the distended vein, the upper arm is brought down and fixed or hooked upon the other ; and as they are now made, the projection or pad, or substitute for it, presses upon the vein, and they are allowed to remain thus for a week. At first we used a common straight needle, with a piece of bougie or elastic catheter over the vein, and a ligature twisted, figure of 8 fashion, over this and round the ends of the needle. Then the idea of what we may call the safety needle occurred to me, suggested as it was by the safety pin in common use for ladies' shawls, and in the dresses of infants ; and this needle was first used with a piece of bougie as a pad, or a small piece of lint rolled together. This was somewhat apt to move from its place, or might be moved by the patient, and then we thought of making a kind of indentation in the upper arm of the needle in which this might rest, and narrowing the fenestra so as to insure steady pressure ; and while thinking of this, the needle which I now show you was handed to me by one of my dressers, Mr. C. J. Russell, affording a fixed pad, a part of the instrument itself, consequently rendering it impossible for the patient to remove it. Startin's needle is on a similar principle, but more apt to press on the skin ; and another is mentioned in the 'Medical Gazette' some months ago."

The 'Medical Critic and Psychological Journal,' July. As usual, there are many interesting articles in this number. The *Windham Case* exhausts the evidence. The *Colonisation of Lunatics by the Legislature* touches a subject of great importance, the peculiar advantages and evils of which are stated, and reference is made to the Scottish Lunacy Bill, which contained a clause permitting lunatics to be lodged in private houses. The article on *Counter Practice* discusses the subject of dispensing by private practitioners, and objects to its continuance. It will be a long time whenever, if ever, the bulk of the population are attended by a practitioner who writes his prescription, takes his fee, and sends the prescription to a druggist to be dispensed, thus involving a double charge to the patient. The tendency is in the other direction. The only com-

promise will be that of the practitioner paying the druggist himself, who will then act as his assistant. *Continued, Remittent and Intermittent Drunkenness* and the *Debateable Land in Psychology*, are also excellent articles. The former, a translation of Salvatori's celebrated essay, is analytic, the latter more popular, but each good of its kind. Salvatori reports cases in which a cure is said to have been effected with saffron and *serpyllum*, a wild thyme, which is his panacea; but we take leave to doubt the wonder-working efficacy of the combination.

The 'Medical Times and Gazette.' The first of Mr. SULLIVAN'S lectures on the *Blood of the Vertebrata* commences the number Mr. Gulliver makes some tart remarks on the bad habit of modern medical literature, that of translating and compiling—a natural result we should say of the "stuffing" process in education now in vogue. A young man of promising talents having been drilled to an excessive use of the reading faculty, and to the acquisition of recorded facts, takes naturally to the business of compilation. Hence it is that nearly all our young men first make themselves known as translators and compilers. Originality is fast becoming more and more rare. Mr. Gulliver remarks on this point:

"Indeed, this is an age of compilations and translations, which have been greatly increasing of late. Yet it may be questioned whether the learning, candour, and comprehensive exactness of Haller's 'Elementa Physiologiæ' have ever been surpassed or even equalled, while it seems probable that the extraordinary multiplication of books of the first-named class has rather confused and confounded than illustrated the history of physiological science. Certain it is, that many branches of it which have been well cultivated and wrought out in this country, are afterwards transferred to the Continent, and published in books there, and then translated and brought back as novelties to us, in such simplicity—not to say duplicity—as to the real origin of the facts, that they are actually paraded as part and parcel of foreign genius and discovery, with a contempt of the science of this and Hunter's country, thus subjected to a species of systematic piracy which has been and is increasing, and ought to be diminished.

"It is a sorry state of physiological history in Britain, and very little to our credit, when translators can thus venture to put before us versions of books in which the composers—too often even under the patronage of one or other of our most respected teachers—have used the fruits of the labours, while concealing the names of our best physiologists, by excluding them from the so-called and ostentatiously proclaimed lists of the literature.

"Two for example, now no more, of the most eminent discoverers in certain departments, that England, or, indeed, all Europe can boast, have been thus ignobly treated. But let us hope that there will be no want of generous hearts to defend and maintain their countrymen, Hewson and Quekett, on the pedestals which they have so honourably gained. Physiology is too vast a field for us to say that any cultivator has left no part of it untouched; but it may be truly said—and I am glad to take this opportunity of making the assertion—that these two touched none that they did not adorn. Still it ought in justice to be stated that we have some excellent and well-known systematic treatises of native growth, by good and true British observers, while the best foreign work of the kind has not been translated into our language."

Mr. Gulliver commences his examination of the blood with the red corpuscles. We quote the following observations on *Analogues:*

"Thus you will have seen that there are two sets of red corpuscles in man and mammalia—to wit, a temporary or embryonic set which have nuclei, and a permanent or rather mature set devoid of nuclei. And you will be prepared to recognise this embryonic set of red corpuscles of mammalia as the analogues of the mature set of red corpuscles of oviparous vertebrata; while the colourless or primogenial corpuscles are analagous to the pale globules of the blood of adult vertebrata, and to the prevailing or characteristic corpuscles of the blood of many invertebrata; so that, in its course towards the highest type, there are temporary phases in which the blood of the mammalian is analogous to the permanent states of the blood of invertebrate and of oviparous vertebrate animals respectively."

Dr. ARTHUR LEARED contributes a paper on the *Differential Stethometer.* The description is accompanied by a diagram, without which it is difficult to be understood; we, therefore, do not produce it. Dr. ROBERT KNOX contributes to the same journal some interesting remarks on *Membranous Cysts in the Interior of the Urinary Bladder,* accompanying them with a graphic account of a case of the late Mr. Liston's, which we extract:

"Late one evening, Mr. Liston called on me and asked me to accompany him and to assist him in an operation he contemplated, and in order not to lose time he would narrate the particulars as we walked along. They were as follows:—The patient was a man in humble life; he had been unwell for some time, complaining chiefly of an obstruction to, or a difficulty in, discharging the urine from the bladder. On passing a catheter, Mr. Liston felt, or fancied he felt a soft, yielding, but obstructing body in the prostatic portion of the urethra. This readily gave way before the catheter, which then passed into the bladder, but on being withdrawn it was followed by the foreign body, which immediately re-occupied its former position. Mr. Liston then explained to me his view of the case, which was this:—'A cyst or false membrane of the form of the bladder itself, occupied, as he conjectured, the interior of the bladder, and were this removed by an operation the patient might recover.' The boldness of the proposal, or rather the diagnosis itself, astonished me, and I told him so; but on introducing the catheter, and meeting with the same phenomena as he had described, I at once gave into his view. We were alone. With a straight sharp-pointed bistoury, which he usually carried in his waistcoat-pocket, he opened the bladder above the pubes, and as the incision proceeded there escaped from the bladder a foreign body resembling a cyst or false membrane, as he and I concluded it to be, and of the shape of the interior of the bladder. It escaped into my hands. The wound was closed simply; and as we returned home, bringing the preparation with us, I could not but observe to him that of all the bold and successful operations he had performed, none equalled in merit the diagnosis he had just made, and that half a century might elapse before he made such another. The patient recovered and lived for some time.

"From that day until the present time I heard no more of the case, and thought no more of it until the occurrence of the one mentioned by Mr. Spencer Wells to the Pathological Society. Discussing it with Dr. Tanner, I suggested that we should look for Mr. Liston's preparation in the Museum of the College of Surgeons, to which Museum I knew that Mr. Liston had presented a few rare pathological specimens he had brought with him, many years ago, to London. To my surprise we found a layer of muscular fibres on the cyst, thus throwing doubts over the nature of the preparation itself. There was the identical cyst, or pseudo-membrane, as I had always fancied it to be, evidently complicated with another structure, whose presence there, could not be readily explained on the pathology of Baillie or Hunter. I have again re-examined the preparation with Mr. Henry Thompson, whose great experience and extended inquiries into prostatic and vesical diseases are well known. I think that the presence of muscular fibres forming a sort of layer of the sac, cannot well be doubted, so that the preparation is not altogether what Mr. Liston and I took it to be,—a simple pseudo-membrane composed of but one tissue; and now arose the question in my mind, whether I had not seen or read somewhere of the formation of false muscular fibres, the product of inflammation, as well as of the usual pseudo-membrane, for I felt disinclined to believe in the theory that the cyst found in the bladder was in reality the mucous membrane, and a layer of the muscular, in a sloughing state detached from the walls of the cavity. I felt convinced that I had read of a case or two in which a layer of muscular fibres had formed in large masses of exudation, arising from an inflammation of fibrous or cellular membrane. Turning to the learned Vogel, I there found the title of the work, 'Tractatus Anatomico Pathologicus Sistens duas Observations rarissimas de Formatione Fibrarum Muscularum in pericardio Atque in pleura obviarum.' Leo-Wolf: Heidelberg et Leips. 1832. Vogel quotes Wützer's critique on it in Müller's Archiv., 1834, p. 45. I never saw Leo-Wolf's preparation, but if the engravings in his treatise truly represented the structures, then undoubtedly muscular fibres had been formed by the same process which gave rise to the effused false membrane on which they rested. But Vogel, whose accuracy is extreme in all such matters, assures us (p. 184), that 'the microscopic examination (the only decisive test) had been altogether neglected, as in the cases observed by Leo-Wolf.' But simple non-striated fibres are often formed as independent (fibroid) tumours, and causing hypertrophy of the muscular walls of cavities. The question then is, what is the real nature of the seemingly muscular fibres to be distinctly seen in the cyst removed from the urinary bladder by Mr. Liston? Of those somewhat more doubtful in the first case discussed by Mr. Spencer Wells, in his second case, and in the very interesting case of Mr. Maunder, which he kindly related to me, and which I am indebted to Mr. Henry Thompson for an opportunity of examining with the utmost attention, assisted with all his knowledge of these structures. A brief statement of the history of these cases may ultimately lead to some important investigations, and clear up a pathological question of the obscurest. For my own part, I feel disposed to reduce the whole phenomena to one simple law of morbid epigenesis of muscular fibres, real or apparent."

Dr. STEVENSON BUSHMAN communicates *Hints for Certifying in Cases of Lunacy.*

The 'Lancet' opens with Mr. W. S. SAVORY'S Lectures on *Motion in Plants and Animals.* This is followed by a continuation of Mr. HERY LEE'S Lectures on *Syphilitic Inoculation.* Mr. HAN-

COCK contributes *Some Further Observations on the Operation for Diseases of the Ciliary Muscle.* In answer to a remark by Mr. Haynes Walton, he says :—

"I have never believed, nor have I ever stated, that glaucoma is caused by spasm of the ciliary muscle, whether persistent or temporary. I have stated that, in my opinion, the opthalmoscopic and pathological appearances of the *bloodvessels* were greatly enhanced by, if not in some instances entirely due to, the obstruction of the circulation, caused by the undue and excessive constriction exerted on them by the spasmodic or *extreme contraction* of the ciliary muscle ; but I have never as yet said anything about the ciliary muscle inducing hardness of the globe of the eye, nor of its contracting with sufficient force to groove the 'hard, stony eyeball of glaucoma.'

"I believe that glaucoma is not caused by hypersecretion of the vitreous humour ; but that it has its origin in some peculiar condition of blood, considered by most opthalmic surgeons as gouty or rheumatic—a view of the question most ably supported by Mr. Canton in his admirable papers 'On Atrophy and Degeneration of the Arteries,' and confirmed by the writings of Lawrence, Sichel, Mackenzie, Tyrrel, Bell, as well as by the dissections of Ebel and Rosas ; that the muscular fibres and bloodvessels become implicated, as sooner or later do the heart and bloodvessels in that disease ; that the ciliary muscle, losing its elasticity and contractility, is converted into a rigid, unyielding cord. The eye is consequently deprived of its accommodating power, and the bloodvessels—nerves, and doubtless the absorbents, from their peculiar arrangements with reference to this muscle—being compressed, the circulation through these vessels is impeded ; their coats, already weakened by the exciting disease, yield, form aneurismal pouches, give way, or become varicose. The parts supplied by these vessels, nerves, &c., are deprived of their nourishment ; whilst the infra-ocular effusion, or hypersecretion takes place subsequently to, and resulting from, these morbid changes. . . . . .

"Mr. Haynes Walton seems to think that the hardness of the eyeball precedes the constriction of the muscle, and that I believe the muscle by its contraction actually draws in the distended coats forming the sulcus met with in glaucoma and other diseases of the eye. On the contrary, I believe the contraction, whether spasmodic or otherwise, precedes the hardness ; and that whatever influence the muscle exerts in these cases upon the coats of the eye is of a passive rather than of an active nature ; that, in other words, it does not 'groove' and draw the coats of the eye in, but that it prevents the coats of the eye expanding at this point ; hence a given quantity of fluid effused within the eyeball would render it more tense than where such condition of the ciliary muscle does not obtain, and this may easily be verified by the following experiment :—I took a piece of the intestine of an ox, and having placed an elastic india-rubber ring around it, I forced in as much water as it would hold by means of a bladder syringe. Of course, as the water was forced in, the ring expanded, and the intestine became uniformly tense, and by measurement I found the quantity of fluid thrown in was forty-two ounces. I then removed the india-rubber ring, and substituted a ring of string of the same size as the india-rubber ring when not expanded, and I again injected as much water as I could ; but as the string was inelastic, the gut was constricted at the spot encircled by it, whilst the quantity of fluid measured only thirty-three ounces, so that the loss of elasticity diminished its capacity by nine ounces."

Dr. WALTER SCOTT reports a case of *Extra-Uterine Fœtation*, and Dr. SOMMERVILLE OLIVER a severe case of *Scorbutus*." He thus describes it :—

"On the 28th of June, I was called by Mr. M—— to visit his wife, who was, he said, suffering from rheumatic pains in various parts of her body. After entering the room in which my patient was lying in bed, I noticed on her arms (which were uncovered by the bed-clothes) yellowish bruise-like marks, which induced me to suspect that the pains of which she complained were connected with scorbutus—not rheumatism. Of this I was soon made sure, for on examination I found similar appearances on the legs ; and the gums, where they touched the teeth, were congested and swollen, and presented the usual dark red or somewhat purple appearance. The whole gum of the molar region of the lower jaw on both sides was unusually swollen, and not unlike half-putrid liver ; and the molar teeth were absent, the fangs of one of them alone remaining. The gum of the upper jaw, and particularly of the molar region of it, was not nearly so badly affected as that of the lower jaw, nor were the molar teeth of it very evidently loose, which latter condition may perhaps be attributed to the upper molar possessing three more or less divergent fangs.

"The history of the case I ascertained to be as follows :—For two months the woman's husband had been absent from home, and during that period she rarely prepared any dinner for herself. Both the morning and the evening meal consisted of tea with bread-and-butter, and occasionally an egg. Very little milk, and no flesh nor succulent roots or vegetables were consumed during her husband's absence. Her strength gradually diminished, and hæmorrhage from various parts, such as the gums, nostrils, and uterus, occurred. In mentioning the hæmorrhage from the last-named organ, the woman informed me that, though nursing her child of eleven months old, she had menstruated *every day* for the last two months, whereas previously the discharge occurred only once a month. That it was merely the catamenia I did not believe ; indeed, I felt almost certain that it also was simply a result of scorbutus. The cervix uteri was not distinctly more tumid or spongy than is natural during the interval between the menstrual discharges, nor did it appear discoloured when viewed through the speculum ; and the os was apparently not more patulous than is usual during the period referred to. Milk was still secreted by the mammæ in almost ordinary quantity.

"I mentioned to the woman that, in my opinion, defective diet had been the cause of her suffering, and desired her to take potato-soup (the gums being so bad and some of the teeth so loose as to render mastication difficult or impossible), beef-tea, and milk, daily. I also prescribed iron, potass, and lemon-juice."

She eventually recovered.

DEATH BY LAUDANUM.

A painful case of suicide by means of laudanum has just occurred here, of which the following are the particulars :—Captain ——, æt. 84, of a powerful constitution, and of very bulky frame, was found dead on Sunday, July 6, 1862, in his own house at this place. He had been suffering for some years from ulceration of his legs, the consequence of wounds which he received in naval actions in the English service. He had of late some mental annoyances which he made no concealment of, but at the same time they did not in any way affect his mind or body. His sleep was sound, his appetite was good, but in consequence of some discharge which he was suffering from he kept to his bed for some months past. His coolness and presence of mind were remarkable. He often expressed himself to me as well as to others as tired of life, and that he wished it ended. He wrote to and entreated of various medical men to procure for him prussic acid, stating that he wanted it to relieve his asthma, which he occasionally suffered from. Two days previous to his death I called to see him. ; he then asked me many questions of the doses and effect of laudanum. It will be well to state here that for several years he had been in the habit of taking fifteen to twenty drops of laudanum every night at bedtime, which was administered by his servant, who had been with him for many years. This bottle of laudanum being nearly finished, he sent for two ounces, the quantity which he was in the habit of getting, and when it came he took possession of it, his servant being out. The next night passed with his usual dose of fifteen drops. On Sunday, July 6, I was sent for at 8.30. His servant told me that he had seen him as he thought sleeping at 5.30 a.m. He was lying on his back, slightly turned towards his right side, his left hand doubled under him, as if to enable him to raise himself in bed. He had vomited a quantity of a yellow liquid over his shirt, which was, however, then nearly dry. His mouth was half open, his face, lips, and tongue of a very white colour, and his eyes closed ; on opening them, the pupils natural, not contracted ; the body nearly cold ; the limbs lay in a natural state, the bed-clothes not disturbed. From the conversation which I had with him but two days previously, the thought immediately struck me that his death was produced by poison ; and, mentioning my impression to his servant, he then gave me the account of the laudanum, which I mentioned above. In a drawer at his bedside was an empty bottle, which his servant at once recognised as the one which he had received but two days previously full of laudanum ; it then contained about twenty drops. The bottle was corked and the drawer closed after he had taken the two ounces of laudanum.

I have read of many cases of self-destruction, but I have never met with one in which so much forethought and coolness was exhibited, and in which not one symptom of insanity could be discovered. The servant then handed me a paper, which he said the defunct had given him two days previously. It was dated July 6, the very day on which he was found dead, and which commenced, "In the event of my death, I wish," &c. &c. He was in the full possession of his faculties, and most exact in the slightest particular. The cause and manner of his death being so evident, he was buried without any judicial investigation.

Wishing to satisfy myself of the state of the stomach, I opened him at the expiration of forty-eight hours. The stomach and intestines were enormously distended with gas. In the stomach was a small quantity of yellow liquid, but I could detect no smell of spirits of wine. In a few spots there was a slight pinkish appearance, but in other respects it was perfectly healthy. The spleen broke up under very slight pressure into a thick, black liquid resembling treacle. The liver was small, of a dark greyish colour ; an enormous quantity of fat prevailed throughout the whole abdomen.

It will be well to state here that for some years past he had been constantly threatening to put an end to himself, but as he never attempted it, his threats were not considered as real.

Bagni di Lucca, July 20, 1862. JOHN GASON, M.D.

THE MEDICAL CIRCULAR.

SATURDAY, AUGUST 6, 1862.

THE MEDICAL ASSOCIATION.

Associated with [illegible] reports at the command of the British Medical Association, what palpable are the extravagance and folly of the present mode of expenditure. Are the members so demented that they cannot see the extreme absurdity of the course the Committee are pursuing? Or have they so little regard for Medical science and the permanent interests of their order, that they are willing to allow a large fund to be annually wasted, rather than make a vigorous effort to do something worthy of themselves and their Profession?

When the annual income of the Association was only one thousand pounds, some of the best men in its ranks thought that the money was unnecessarily spent in keeping up a journal without merit, and upon pretences that were delusive. The annual income of the Association now approaches three thousand pounds, and yet almost every shilling of this noble subscription is expended upon the same dismal journal! What have those gentlemen to say now to this melancholy misappropriation of their funds? More than two thousand five hundred pounds were spent upon the journal last year! What an enormous sum to pay for the ill-written and flippant effusions that characterise the periodical!

The Association should remember its position. It may be convenient for it to assume the character of a private society; and to deny its responsibility to the Profession at large; but it cannot consistently occupy this ground, whilst it arrogates to itself a title that affects to embrace the entire Medical body. It is as the "British Medical" Association that we address it; and we ask it, what does British Medicine owe to its labours or influence? There are eminent members of the Profession in the Association—some of them filling high appointments, others known throughout the world for their scientific attainments; and we ask them if the Association ever lifted a finger, or spent a shilling, to aid their researches? Are they content that the Association should occupy so humiliating a position? Do they not blush to feel that their abundant resources are diverted from their proper use to maintain a journal which scarcely one of them would acknowledge as an organ of publicity, if he wished to promulgate a new fact in Medical science?

The Association was originated amid promises of usefulness that excited the hopes of every lover of science—grand schemes cradled its birth; pæans of rejoicing reverberated through the halls of its nativity; congratulations were loud and rife, that an organisation was at length established that would give effect to every laudable ambition. Have not all these hopes been blasted, these schemes shattered, these congratulations falsified? And what does the Association possess in exchange for these losses? A journal! and a journal that is in itself so ruinous a possession, that it precludes the possibility of any other undertaking being attempted, or useful end achieved. Everything the Society owns is thrown into its devouring maw; and it still cries, Give! Increase the income twofold; it will take all upon the pretence of improvement, and still cry, Give! Every man of business knows that in any of the ordinary transactions of life, "improvement" means expenditure; and that, whilst the latter is certain, the former is of doubtful attainment. Thousands of pounds may be spent, and nothing but a "bad bargain" be the result of the venture. This is especially the case in literary enterprises, and pre-eminently so in the instance of the 'British Medical Journal.' The reason is obvious; something more than money is required to achieve literary distinction, and that something the Association cannot buy. And if, by chance, the Association came into possession of the power wanted, it would be valueless in its hands, owing to the conditions under which it must be exercised. A joint-stock literature can never possess either dignity, character, freedom, or power. The intellect that should preside over it must be enfeebled, and the hand palsied, by the benumbing influence of the powers that really rule. Reaction against this debilitating influence can be manifested only in petulance, acrimony, ill-temper, and puerile and empty boasts of a power, eagerly desired, but never enjoyed. Incapacity, if not natural, is engrafted, and cunning subserviency becomes the predominant rule of action. Under such circumstances, the very men who own the Journal can never respect it; they instinctively feel its inferiority and use it only for inferior purposes.

In most families, there is a thing called a rag-bag, into which thread-bare or useless articles are thrown: what is the Journal but the rag-bag of the Association? The best thoughts of its members are sent to the regular journals; the second-hand, worn-out ideas are committed to the rag-bag. Yet, to keep in existence—such a "superfœtation," as a correspondent styles it in this week's MEDICAL CIRCULAR—more than two thousand five hundred pounds are annually expended by the Association! What madness is not this! What blindness to the real dignity and possible usefulness of the Association!

We pointed out last week some of the duties which the Association might discharge, and which we have a right to expect at its hands. We will recite them:—

1st. It might appoint commissions to investigate difficult questions in medicine, surgery, and the ancillary sciences.

2nd. It might award valuable prizes for original researches in physiology, pathology, or therapeutics.

3rd. It might endow scholarships in the various metropolitan and provincial schools for the sons of Medical men.

4th. It might collect specimens of natural science, and purchase books to establish a museum and library in connection with each Medical school in the provinces.

5th. It might organise a commission for the reception of returns of sickness, mortality, and treatment, from all the British hospitals, and publish the results for the benefit of Medical science.

6th. It might publish a series of "Transactions," quarterly, half-yearly, or annually, as needed.

7th. It might establish a "circulating library" for the use of its members.

These are a few of the various purposes which the Association with its large resources might fulfil; but to the unspeakable shame of those gentlemen to whom the management is entrusted, not one of these useful duties, nor anything corresponding to them, is either achieved or attempted. Once a year the members meet, and, as a matter of form and precedent, congratulate each other rather amusingly on the great things the Association has done, or intends to do, in Medical politics, ethics, or economics; but as regards Medical Science, there has never yet been a man bold enough to challenge, in behalf of the Association, one word of praise or compliment. Provincial Science blushes for its organ, and its mouth is dumb with shame. There are admirable physicians and accomplished surgeons in the English counties, so admirable and so accomplished that they feel the worthlessness of their journal too

acutely to dare to associate the honoured name of Science with its pages.

Is there ever to be an end of this imposture? Does the Association ever mean to rise to the height of its proud name? What did the last balance-sheet show, but this—that almost the entire income was divided between the writers, the printer, the publisher, and the advertising agent of the Journal? Surely this state of things cannot be allowed to continue. The Association should be mindful of what it owes to the Profession, even if it be indifferent to its own renown, and, by getting rid of the incubus of an expensive and useless journal, recover the liberty of employing its resources for more permanent and honourable purposes.

THE BREAK-DOWN OF THE MEDICAL COUNCIL.

The Medical Council has not succeeded in satisfying either its friends or its foes. Great expectations were formed of its authoritative action, for it was hard to believe that the ablest and most conspicuous men in the three capitals could be assembled around one Board without accomplishing results that should delight the hopes of the most sanguine, and rebuke the incredulity of scoffers. If there be "safety in a multitude of councillors," the Medical Council has not yet discovered the secret. Its doings are by no means a guarantee of safety either to itself or its constituents. Its recent behaviour towards the Council of the College of Surgeons, who transgressed its authority, is an instance of the perilous predicaments into which public bodies fall that have neither intuitive foresight nor practical wisdom.

All that the Medical Council has hitherto done has been to try to give effect to the desires of the Profession as expressed long before the Medical Council had an existence; but, unfortunately, it has spoiled everything it has touched. It has tried to give the Profession a new Pharmacopœia; but, heedless of the dangers attending ambiguous instructions in pharmacy, it rashly proposed to alter the present series of drachm, scruple, and grain weights, and to establish another of different value, the consequence of which would have been, that throughout the country different weights would have been used, that the old prescriptions must have been dispensed with the old weights, and new prescriptions with the new weights; whilst, again, many practitioners who have been accustomed to order certain drugs in specific doses as designated by the old grain weight, would continue to do so, and would be under the necessity of denoting the fact in the body of the prescription, all which would have thrown the practice of pharmacy into dangerous confusion. We can easily imagine the perplexity of a country druggist, upon receiving a prescription to dispense, and not knowing whether it was written before or after a certain date. Possibly he might be ignorant of the new law, or not have the new weights, and then, of course, mistakes must happen. The present grain weight is moreover established by law as a standard of computation, and is recognised all over the world. Should it even be set aside for pharmaceutical purposes, it would remain in use for scientific investigations. There can be no real advantage, therefore, in the proposed change. It is probable that the designs of the Council in this matter will be frustrated, and that the old and accepted grain weight will continue to be used. This difficulty has, however, delayed the publication of the Pharmacopœia.

The conduct of the Council in relation to the recalcitrating policy of the College of Surgeons has been marked by equal weakness, and has received general condemnation. Those who support the College censure the Council, because it did not make that provision for instruction in pharmacy, which was the aim of the College; and those who uphold the Council's authority, nevertheless, rebuke its pusillanimity, because it did not vindicate its own regulations with more consistent and manly decision.

The British Medical Association is now holding its annual meetings, and we may gather from the addresses and resolutions of those assemblages, what are the sentiments of the Profession upon the conduct of the Medical Council. Last week we reprinted a portion of the address of Mr. Duncalfe, who, whilst reprehending the Editor of the Society's Journal, pronounced emphatically in favour of apprenticeships, thus endorsing the opinions recently pronounced by Mr. Lawrence. We do not agree with Mr. Duncalfe in the whole of his utterance on this subject, but we do agree with him as to the necessity of some provision being made in this respect, in order to secure proper preliminary instruction and discipline for the student of medicine. In other local gatherings the Council has been equally condemned, though the grounds of censure have not been so explicitly set forth. At the meeting of the North Wales Branch, a report was read containing the following sentence: "This public body (the General Medical Council), does not appear to have acted as satisfactorily as was anticipated, and has fallen immeasurably in the just expectations of the Profession. Their decision respecting the regulations issued by the Royal College of Surgeons of England, with regard to preliminary and professional education, appears to your Council fraught with ominous significance." During the course of the proceedings a resolution was passed in which the members expressed "their surprise and strongest condemnation" of the Council's conduct.

We presume that the Metropolitan meeting will not pass over without an expression of opinion on this important subject. It is obvious that the Medical Council has proved itself unequal to the important duties with which it has been charged; at the same time we believe that if it would devote its attention more to the practical wants of the working bees of physic, it would recover the estimation it has lost, and confer permanent advantages on the Profession.

MEDICAL APPRENTICESHIPS.

It is quite time that the Profession should make its wishes known upon this critical question. Is it desirable that the candidate for a licence to practice should be required to study the duties of his Profession under the tutelage of a general practitioner? The Profession must speak out. Let there be one answer—yea or nay. We, by no means, desire to see the old system of apprenticeships revived. The desultory idling which characterised the mode in which that period was passed by hundreds of pupils in times past was pernicious to habits of industry, and prevented the acquisition of much necessary knowledge. We have no desire to build up again what we have knocked down; but we are of opinion that some modification of the system is requisite. We have seen enough of the shortcomings arising out of the existing laxity to desire that some regulations should be made, by virtue of which every candidate should be required to give proof of his competency in Pharmacy, as well as in other branches of Medical practice. Why should not a student be required to produce a certificate that he has for twelve months practised

Pharmacy under the instruction of some Member of the College of Surgeons, or Licentiate of the College of Physicians or Apothecaries' Hall? These twelve months might be passed in the acquisition of this knowledge, either before the commencement of Hospital attendance, or after its conclusion, as we intimated some weeks ago; but it would be better, both for student and instructor, that it should be passed immediately previous to registration—for the student, because he would be able to apply his theoretical knowledge to the facts of practice, and qualify himself more efficiently for an independent career—for the practitioner, because the pupil would be more reliable, would learn more readily, and, whilst himself acquiring knowledge, would be able to give some help to his teacher.

This issue has been raised, though indirectly, by the dispute between the General Medical Council and the College of Surgeons. We now place it distinctly before our readers for their determination. Hitherto we have contented ourselves with exposing the evils arising out of the existing neglect of the dispenser's important duties, and have argued for a reform; but we now wish to rouse the Profession, that they may intervene between the General Council and the College, and pronounce their wishes upon this important question in unmistakeable accents.

SUMMARY OF THE WEEK.

SUBCUTANEOUS INJECTION OF QUININE.

We observe a report in the 'Medical Times and Gazette,' by Dr. James McCraith, of a new method of administering quinine with equally beneficial results as when exhibited by the mouth, and with a great saving of the drug. The scarcity of quinine at present gives especial interest to this new method, which consists in injecting under the skin a saturated solution of quinine in alcohol. An incision is first made in the skin and the solution injected with any fine syringe. Two grains exhibited in this mode are said to produce as efficacious results as twenty grains administered by the stomach. One remarkable effect induced by the operation is that of profound sleep. Dr. Chasseaud, who is Physician to the Hôpital de St. Antonio at Smyrna, is the inventor of this method, which, should it prove to be as useful as represented, will entitle him to much praise.

LUNATIC ASYLUMS FOR THE CITY OF LONDON.

The first stone of this Asylum was laid at Stone, near Dartford, on the 29th ult., by Alderman Dakin, Chairman of the Committee, to whom the duty has been entrusted by the Corporation of London of erecting the building. The Corporation has had the subject under its consideration for many years, but it is only within a recent period that a determination has been formed to proceed with the work. This tardiness was owing to unexpected difficulties, arising out of the peculiar constitution of the municipality. After the Justices had decided upon beginning the work, and, indeed, had actually entered into an undertaking to purchase the site, a question arose as to the mode of raising the funds. The Justices proposed to exercise the powers given to them by the Act of Parliament, and to levy a county rate; but as the citizens of London had never been liable to such an impost, they were but little disposed to sanction the introduction of so disagreeable a novelty for such a purpose, and stoutly resisted the Justices. The Corporation, on its part, was unwilling to appropriate funds for an object that was rather parochial than municipal. At length, however, it gave way, and consented to allow the civic purse to be charged with the expense of the building. There can be no doubt that the work will be well done, as is everything that is carried out by the city municipality. We were gratified to hear Alderman Dakin advert to a subject in the course of his address, which we esteem of great importance; we allude to the reception, on a moderate payment, of patients who are not actual paupers, but who are, nevertheless, unable to pay the cost of residence in an ordinary asylum. The Act of Parliament requires that all patients received into a County Asylum shall be provided with the same character of food and accommodation—a condition that was made originally for the especial purpose of preventing respectable persons from taking advantage of the facilities offered for placing lunatics into the County Asylums. The humane object which, therefore, we have had in view, is counteracted by the letter of the Act of Parliament; but we have no doubt that little difficulty would be found in making the Act speak a more liberal language; and, if not, then fresh powers should be obtained from Parliament to enable the Justices to realise this design.

The new Asylum is situated on a lofty site, commanding a fine view of the Thames and the surrounding country. The soil is gravelly and may be easily drained. It is intended that the sewage of the Asylums shall be received in tanks, and used as a manure for the grounds; indeed, the Asylum will be made in every respect as perfect as experience can suggest.

POISONING BY STRYCHNINE.

Cases of poisoning by strychnine are becoming so numerous, that it is evident this alkaloid is taking the place of arsenic as a popular poison. The unfortunate Mrs. Vyse resorted to Battle's Vermin Powder—the active principle of which is strychnine—to extinguish the life of her children; and since the committal of her crime, a servant girl at Lincoln has employed the same agent to destroy her infant, whom she was tired of nursing. The Legislature should interfere in this matter; and chemists should not be permitted to sell such virulent poisons for the mere purpose of killing rats. Vermin can be easily trapped, and there is no sufficient reason for permitting the general sale of such virulent poisons.

SURGERY IN THE COLLEGE OF PHYSICIANS.

There is a great probability that the College of Physicians will institute an examination in Surgery, and so fulfil the terms of the Act of Henry VIII., under which the College was originally constituted. The license to practise (subject to registration) will, of course, follow the examination; and, in that event, a rival to the College of Surgeons will be established, which will eventually reduce that body to an inferior status in the Profession. The College of Surgeons must look to itself, and liberalise its charter, giving advantages to its members in that participation of the governing power which has hitherto been so strenuously resisted. We can see greater reforms looming in the distance than any that have yet taken place. So be it. We shall be glad, at any rate, to see a more complete unity, educational and corporate, introduced.

SOCIETY FOR RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN IN LONDON AND ITS VICINITY.

At a recent general meeting of the members of this Society, it was announced that 977*l.* had been distributed in half-yearly relief amongst 45 families of its deceased members, besides 63*l.* given in casual relief. Can we state any more valid reason why our readers residing within the London district post should become members of the Society? we earnestly beg of them at once to apply, at 53 Berners street, for a proposal paper, as two years' membership is essential before their families can receive relief. The late Dr. Darling of Russell square, has bequeathed 100*l.* duty free to this Society.

REVIEW OF BOOKS.

Researches on the Nature and Treatment of Diabetes. By W. Pavy, M.D.

The reputation which Dr. Pavy has acquired in connection with the subject of this work, confers especial interest upon this publication. Dr. Pavy, it is well known, objects to Bernard's views as to the causes that lead to the appearance of sugar in the urine, and has formed a theory of his own resembling that of Dr. Prout. Dr. Pavy thus states the results of his investigations in relation to the glyco-genic functions of the liver:

"From a consideration of the facts that have been brought forward, which, in every respect, corroborate each other, and which, I may mention, stand uncontroverted by any result I have yet encountered, I think we are unavoidably led to deprive the liver of that sugar-forming function with which, in recent days, it has been endowed by physiologists. Our position in reality stands thus. The conclusions upon which our former notions were based, were drawn from results obtainable after death. But, it now becomes apparent that we are no longer justified in regarding these results as indicating the condition that belongs actually to life. It is not, that Bernard's observations are incorrectly recorded, or his experiments inexact; but, that fallacious inferences, as shown by more extended investigation, have been drawn from these experiments and their results. The views I have advanced are perfectly compatible, not with our former conclusions, it is true, but with the experiments upon which those conclusions were founded. From an ordinary examination of the liver and the blood of the right side of the heart after death, we obtain reactions that infallibly indicate a large impregnation of sugar. The deduction from this hitherto has been, that the sugar existed there naturally during life. The deduction, however, although it has appeared to our minds exceedingly plausible—so plausible, indeed, that no one before has been led to question it; yet, confined to such experiments, it is obviously gratuitous. All that can be strictly or logically inferred from the result of such an examination is, that the liver and the right-ventricular blood are strongly saccharine *after death*; to show that this is likewise the condition *during life* requires another mode of experimenting. And, notwithstanding, as it is fair to confess, nothing was to have been reasonably expected beyond a ratification of our views, yet, on actually prosecuting the inquiry, it turns out that we can no longer overstep the strict letter of interpretation belonging to the original experiments.

"Briefly to recapitulate, the following are the conclusions that arise out of the facts that have as yet been mentioned in reference to glyco-genesis:

"Evidence has been given that the so-called glyco-genic matter is formed in the liver from sugar as one of its sources. Hence, if sugar were its natural destination, the process would be sugar into glycogene, and glycogene back again into sugar—a repetition that certainly appears, to say the least of it, extraordinary and improbable, as a designed occurrence of nature.

"The blood, under normal circumstances, only contains more or less evident traces of sugar; and that belonging to different parts of the system does not present, as far as I can discover, after adopting the necessary precautions in the examination, any appreciable variation in constitution. In some most-carefully conducted examinations, I was unable to distinguish, by any difference in behaviour, the blood of the portal vein from that of the right side of the heart.

"The liver itself is found free from sugar, or, at the most, is only impregnated with it, to the minutest extent, when treated so as to come down upon it in a condition the nearest possible to that of life."

The experiments and considerations, referring to the "physiological relations of sugar," are suggestive and interesting.

Adverting again to the influence of the liver in the sugar-forming process, the author says:

"Looking at all the facts that have been brought to light by modern research, I am strongly inclined to believe that the organ whose action is essentially at fault in diabetes is the liver. I know of nothing to show that the stomach exercises any special assimilating or converting influence over the saccharine principle. In compliance with physical laws, sugar presenting such highly diffusible properties as it does, cannot, when existing in the stomach or intestine, escape entering the circulation and being thus carried to the liver. Now, the liver is the organ that appears to exert an assimilating power over the saccharine element of our food. Whilst traversing the capillaries of the organ, it seems to be picked out by the hepatic cells and submitted to transformation. This immediate transformation is a necessary concomitant, because sugar could not remain as such in the hepatic cells. From its diffusibility, it would be carried back again into the circulating current. But, the evidence afforded by experiment goes to show that it does not reach the general circulation, and nothing is more clearly established to my own mind, than, that one source of the amyloid substance of the liver is saccharine matter. The numerous results I have referred to, in a previous part of this volume, all harmonise with each other and prove that the ingestion of starch and sugar leads to a large accumulation of amyloid substance in the liver. In accordance with the properties required of it, for retention in the hepatic cells, this amyloid substance occupies a position the very antithesis of sugar as regards diffusibility. Like albumen and unlike sugar, it is devoid of a disposition to diffuse through animal membranes.

"Although there appear to be good grounds for believing that it is upon a defective action of the liver that the phenomena of diabetes depend, yet, when we come to speak of the circumstances determining this defective action, we arrive at a point that, it must be admitted, still remains without a clue to its solution. If, however, experimental research has not yet disclosed the nature of the pathology of diabetes, I believe it has paved the way to a position, from which the disease is more likely to be investigated with success. It is fair to infer that, as long as our notions upon the physiology of this subject were based on erroneous conclusions, no real advance was likely to be made in its pathology unless by some improbable fortuitous discovery.

"As to the cause of diabetes, I take it that in different cases different causes may be concerned in the production of the disease; just as we learn from experiment that there are various ways by which saccharine urine may be artificially occasioned."

With reference to treatment in diabetes mellitus, Dr. Pavy advocates the avoidance of the ingestion of saccharine substances, and has devised a substitute for bread, composed of almonds and eggs. This work is highly creditable to its author, and will take a place among the best in our scientific literature.

Chloride of Zinc: Incidents in the use of, during Twenty-five Years. By J. Hendrie, M.D.

The author gives an account of numerous cases in which he has used the chloride of zinc with advantage, including polypi, hydatids, cancers, &c.; but the cases are much too briefly reported to be valuable.

On the Nature, Causes, Variety, and Treatment of Bodily Deformities. By E. J. Chance, F.R.C.S.E. In two parts. Part I.

This work is well conceived, and it enters into the subject in a more philosophic spirit than is observable in most treatises, the authors of which seem particularly to affect the notion of being practical, and degenerate into pedantry. Mr. Chance's book is one of the best yet produced, and will, no doubt, be appreciated by the Profession.

On the Mechanical Appliances Necessary for the Treatment of Deformities. By Henry Heather Bigg. Part 2. The Spine and Upper Extremities.

We need not say that this is a very different book from the foregoing, yet it is highly meritorious. Mr. Bigg is a mechanician, and a most accomplished one. In this book he confines himself to an exhibition of his particular art; and he has consequently produced a work that has no superior. As a mechanician in orthopædics Mr. Bigg well sustains the character of our country.

On the Medical Properties of the Aix-la-Chapelle Hot Sulphureous Waters, &c. By L. Wetzlar, M.D.

This is a useful description of the medicinal uses of the Aix-la-Chapelle waters. The diseases said to be chiefly benefited are rheumatism, gout, paralysis, neuralgia, certain cutaneous affections, chronic bronchitis, scrofula, and syphilitic affections.

On Ovarian Dropsy: its Nature, Diagnosis, and Treatment. By I. Baker Brown, F.R.C.S.

The reader of our periodical literature must be familiar with the labours of Mr. Baker Brown in this department of surgery, and will be gratified by the publication of a separate work in which the author has set forth the results of his practice. Mr. Baker Brown continues to place confidence in and to enjoin the practice of tapping and pressure in simple unilocular cysts. There can be no doubt that every prudent surgeon would employ any minor expedient before having recourse to the formidable operation of the abdominal section. The first chapter gives an account of the anatomy and development of ovarian cysts; the second the symptoms and course of the affection. Other forms of ovarian disease are then described. The fourth chapter treats of the diagnosis. This is a very good chapter; we extract the recapitulation:—

"To recapitulate:—When, with a slowly-increasing abdominal tumour, there are such general signs as emaciation, sunken or contracted features; the absence of marked œdema of the legs, of the special symptoms of ascites, or of those organic lesions productive of it; of any notable impairment of the patient's activity; of any great deterioration of the functions of life, and of the characteristic signs of pregnancy, we may suspect ovarian dropsy to exist. When percussion reveals fluctuation, and in every change of posture the fluid is detected at the most prominent part of the tumour, whilst the intestinal sound is present only on the sides and

the dull sound extends into the pelvis, ovarian dropsy may be more than suspected—it may be presumed to exist.

"When in an earlier stage an examination *per vaginam et rectum* discovers an elastic tumour in the recto-vaginal pouch, loose in position, and probably distinctly fluctuating, without the presence of the symptoms of hernia, or of the pain of a prolapsed ovary, then we may be almost certain that it is a dropsical ovarian cyst; and, by watching, the progressive increase of the tumour strengthens the conviction. Likewise it should be remembered that, when there is only one cyst, the tumour is generally more perceptible on one side of the body, and its surface feels more equal; but that, when there is a compound cyst, the unilateral character of the tumour is liable to be lost, the symptoms to be more or less obscured, and the fluctuation less distinct.

"Lastly, we must ever bear in mind the many deranged conditions of organs and functions which may be and have been confounded with encysted dropsy, and which I shall presently describe *seriatim*."

The author then treats of microscopical diagnosis, exploring needles, the uterine sound, &c., and the various diseases that may be confounded with ovarian dropsy. Mr. Brown reports forty-two cases of ovariotomy. These cases are very fully and fairly detailed, and the result shows twenty-two recoveries to twenty deaths. There has been so much written lately as to the proper or best mode of operating in these cases that we quote Mr. Brown's experience on this point:—

"Different methods have been selected by various operators for performing the operation, both in regard to the position of the patient and the manner of making the incisions. My own plan is as follows:—The patient, being placed conveniently on her back, and brought under the influence of chloroform, an exploratory incision, from two to three inches in length, should first be made in the linea alba. Having divided the peritoneum and reached the cyst, two or more fingers should be passed over its surface to ascertain if adhesions exist. If these are slight and recent, they should, if possible, be broken down by the fingers; or, if they are larger and stronger, and cannot be detached, they may be divided by the écraseur; or, if vascular (as, for example, when the *omentum* is adherent to the tumour or elsewhere), after being ligatured by silver wire, may be cut through by the knife or scissors. However, cases now and then occur in which adhesions are so firm and vascular, and so extended, or so peculiarly situated, that it is not prudent to endeavour to detach the cyst, and then we must desist from the operation of extirpation, and substitute for it one of those other plans of treatment already considered—such, for example, as the excision of a portion of the cyst, if, that is to say, it is not deemed more expedient to desist from any further surgical proceeding.

"The presence of adhesions, and the necessity of dividing them, involve an enlargement of the primary incision, a measure otherwise, indeed, necessary to the further carrying out of the operation. An incision of four inches may suffice, but a longer one is often necessary; and on this matter of the length of incision, the operator must be guided mainly by his own judgment of what is necessary to enable him to detach and remove the morbid mass with the greatest facility.

"The next step is to tap the cyst, or cysts, with a proper trocar and canula, and in the evacuation of the fluid to take care that none of it escapes into the cavity of the abdomen. Then, if there is only one cyst, and that not thick nor vascular, a portion of it only may be excised, in the manner described in section A of the present chapter. If the cyst, however, should be found to be thick or vascular, or multilocular, it will be the safest proceeding to have recourse immediately to complete extirpation in the following manner:—The pedicle of the tumour is to be taken in the left hand, and gently drawn outwards from the pelvic cavity—an assistant carefully keeping back, by warm flannels, the bowels and omentum. A clamp—the best, I believe, being the carpenters' callipers—is now applied around the pedicle. This should be passed as near to the tumour as possible; so that, by the entire length of the pedicle being preserved, the fastened end may be kept external to the abdominal cavity. This done, the tumour should be removed by dividing the pedicle half an inch from the clamp, which should be given to an assistant and held at the inferior end of the opening. The operator then closes the wound—and this, I need hardly say, should be done, as in all operations exposing the peritoneum, as soon as possible—by introducing deep silver sutures about an inch from the incised edges, and about half an inch apart, through the parietes of the abdomen. This step is best done by passing a tenaculum needle through both sides of the wound, and then threading the eye with the wire; and on withdrawing the needle, bringing it through and twisting it. By this mode of closing the wound no secondary sutures are required.

"The advantages of the clamp are—that it can be removed in from one to three days; the wound heals more quickly, and the patient may get convalescent in two or three weeks; whereas, where ligatures are applied, they take at the very least nine or ten days, and now and then as many weeks, to come away; and, indeed, one operator has published his cases as successful, the subjects of them having returned to the country many weeks after with the ligatures hanging from the opening; whilst they remain, the patient cannot be considered completely cured. The long persistence of ligatures is due either to too much tissue having been taken up between them, or to their not having been drawn sufficiently tight. Dr. Clay, of Manchester, used Indian hemp ligatures for tying the pedicle, and returned them into the abdomen. I used formerly to think that, when the pedicle was very short, it was better to apply the ligature than the clamp. But now I always use the clamp, taking care, when the pedicle is very short, and the dragging gives pain to the patient, to remove it in a few hours.

"When a clamp is not used, it is usual to employ means to prevent the ligatures returning into the abdomen. For this purpose, a common director, with its convex surface turned towards the abdomen, should be passed through the ligatures, so as to be firmly held by them at right angles to the wound. The ends of the ligatures should now be secured to the abdomen by adhesive plaster, and the wound dressed with common water-dressing. This done, the abdomen must be supported by a many-tailed flannel bandage, comfortably tight, the patient be placed in bed, and warmth applied to the extremities. I was formerly in the habit of giving opium after the operation, but I do not now, except there is much pain, as it has appeared to me to have been the cause of harassing sickness and vomiting, and of other untoward conditions. If pain is persistent, even after taking the opium, and there is flatus, fomentations must be applied over the abdomen, of flannel stuped in hot water, and freely sprinkled with turpentine. At the same time, a cloth, with turpentine sprinkled over it, is placed on the bedclothes near the patient's mouth, so that its vapour may be freely inhaled. This affords the greatest relief, which is due to the well-known anæsthetic properties of this agent. Ice, milk, barley-water, or weak broths, should constitute the diet for the first forty-eight hours; afterwards stronger animal broth may be allowed, and wine, if the condition of the patient admit of it. In many of my cases a mutton chop and a glass of ale have been taken on the third day. It is better, if possible, that the bowels should be confined for four or five days after the operation; and, if opium be considered necessary for this purpose, it is better to introduce it *per rectum* in small doses, for by this plan the danger of nausea and vomiting after its use is avoided. The bladder should also be emptied every six hours by the catheter. The temperature of the room should be carefully maintained for the first week after the operation.

"I have not enjoined the use of any particular length of incision; for this matter must, I am of opinion, be regulated by the special circumstances of each case; the rule on the surgeon's part being to extract the cyst with the least danger to the patient, and through the smallest practicable incision, without incurring a risk of failure in the operation. A small incision, of an exploratory nature, should be the first; if the operation be proceeded with, it must be enlarged sufficiently to admit the extraction of the apparent cyst, and further increase will be very easy, if its peculiarly compound nature, its position or relations, or other circumstances demand it."

We can recommend this work to the notice of our readers as a well-written, practical treatise without any fear that they will question the decision.

Origin of the Cow-Pox.—The Academy of Medicine of Paris is at present occupied in discussing some facts of interest which have taken place at Toulouse, in France. In May, 1860, the matter from an eruption affecting the legs of a horse was inoculated upon the teats of a cow, and produced vesicles similar to those of cow-pox; the pus, moreover, taken from this cow, having been inoculated on infants, gave rise to vaccine vesicles. It is doubtful, however, whether in this case the horse suffered from grease or some other eruptive complaint. Jenner considered that grease might be the origin of cow-pox. Experiments have, therefore, been made with the grease in several countries, but with variable results. It should, however, be recollected that a smith's apprentice, of Chartres, in France, who had not been vaccinated, having shod, in 1856, a greasy horse, presented vaccine vesicles on his hands. The pus from these being inoculated on children, gave rise to similar vesicles; but the same pus sent to the Academy of Medicine at the time, and used for inoculations, yielded no results; while, strange to say, the lymph taken from the child vaccinated from the vesicles on the apprentice's hand, being also sent to the Academy, was the origin of a series of successful inoculations. Such was the state of the question when the facts observed at Toulouse, in 1860, became the subject of a report from a committee appointed for the purpose of examining into the alleged phenomena. It is this report, itself reported upon by M. Bousquet, that the Academy is now discussing.

Duties on Drugs and Medicines in America.—The new American Tariff Bill, which is expected almost immediately to become law, adds very considerably to the duties levied on nearly all articles of import. Drugs are taxed very high, additional duties being imposed in almost every instance: perfumes and cosmetics 50 per cent. *ad valorem*; medicines of various kinds 10 per cent. *ad valorem*, in addition to former duties.

GENERAL CORRESPONDENCE.

THE BRITISH MEDICAL ASSOCIATION.

To the Editor of the Medical Circular.

Sir,—I fully concur in your strictures on the shortsightedness of the British Medical Association with respect to our Journal. A better opportunity of reopening the question so often agitated as to its continuance was never presented than at the meeting of the present week.

I have reason to believe that in the opinion of a large section, if not of a large majority of the Association, the journal is thought to be an incubus, which interposes a barrier to the increase of our numbers, and saps the very foundation of the Society by swallowing up nearly all its funds which could be devoted to much better profit.

Having a stake in one of the existing Medical journals, it will be supposed you have an interest in sweeping a rival from the field. No matter, you take a common sense view of the question, and, with your permission, I will add to your forcible address a few more remarks on the policy of the leaders of the Association. I could point out the men who will thus misconstrue your motives—men with whom "*rivalry in journalism*" "cutting out the 'Lancet,'" "shewing up the 'Medical Times,'" "abusing the Medical Circular" are household words, thus creating hostility to the Association in quarters all powerful, and raising up insurmountable barriers to the extension of its numbers. The fact is simply this: without a journal, and countenanced as it then would be by the 'Lancet,' 'Medical Times' and Medical Circular, each of which would weekly publish its transactions, the Association would, by this time, number ten thousand members. With a journal, carried on as it is in a spirit of rivalry, the Association numbers just enough to pay its expenses and nothing more.

It would seem that we have not been content with trusting our journals to the natural law of supply and demand, or leaving their establishment on that basis of mercantile requirements, which is the only solid foundation for a sound business of any kind; but our Profession has had the honour of introducing journalism under a new phase. We have converted an association, founded for public purposes, into a joint-stock publishing speculation. There are two thousand and more of our body paying at this moment for a Medical journal, which few of them ever dreamt of requiring, which reaches them under conditions that divest it of all the good qualities of journalism, and which in point of fact may be clearly shown to injure every public interest it was no doubt expected to promote. And why? Because as members of a society spread throughout the kingdom, and the principle of association making them ciphers in their isolation, they have no means of resisting that little agreement of a parlour-full of committee-men and their friends, which some years since, begot and forced on them the needless superfœtation of a journal.

Let me, however, be understood, as attributing no unworthy motives to Sir Charles Hastings and the other projectors of the speculation. It was easy to believe that in creating this means of patronage and influence for themselves they were serving the objects of the association. It was clear that by so agreeable a use of the common funds they would acquire higher social position, and be the means of sustaining professional influence, and as the man who has just dined thinks all the world happy, how could they doubt that the public satisfaction would mirror their own? But it was a serious mistake, though fortunately they are not the gentlemen to pay for it. *Plectuntur Achivi.* The pleasing delirium of the chiefs is, as usual, paid for by *the rank and file* who are condemned weekly to read the journal, or pay their money for nothing, perhaps the less dangerous alternative.

Corporate bodies, most of all, if professional, are so constitutionally unfit for business enterprises that they are always failing or under the suspicion of failing. We cannot believe in their success, simply because theirs is not the agency for securing it, and because there is wholly wanting in such ventures the necessary degree of personal interest and personal responsibility. I suggest then that in proportion as a high character in the chiefs of such societies is of importance to their public aims, must it be unwise thus to throw an air of suspicion about their operations, and to suggest to the world that they may be *exploiting* their Committee influences.

If the objects, too, of the Association were limited to its members, something might be said for this narrow, shopkeeping mode of managing the affairs of a great association, but its aim is professedly to represent the interests and acquire the support of the whole profession, and so to bind all in a common policy of mutual well-being. How then reach the whole profession, except by its ordinary organs, by the very organs which Sir Charles Hastings and his Committee exclude, compete with, and make war upon? With good intentions and a proper policy, our objects would command general approval, and all our efforts would secure universal support; but to have the pleasure of commanding a journal the praise of which is no recommendation, the advocacy no strength, and the very existence of which is a guarantee of division for the Profession, and weakness for the corporation, we incur annually enormous expenses, set against us the world of independent journalism, and deliberately excommunicate ourselves from the sympathies and almost the knowledge of nine-tenths of the Profession.

I say, then, to the associated Committeemen—or rather to their leaders—you are engaged in a bootless as well as a needless enterprise. You cannot resort to the expenditure, employ the agencies, exhibit the tact, talent, watchfulness, ready judgment, and, above all, independence—absolutely necessary—in these days of a fierce competition, to give the profession a journal worthy of its acceptance. As a question of mere finance, yours must be the dearest of periodicals, because Medical journals, essentially cheap for other reasons, are made still more so by the fact that their profits arise less from their subscribers than their advertisers, and you are the less justified in your competition, because, as a principle, the better the pecuniary results you leave to the proprietors of the standard journals, the better will those journals be made for the Profession. Besides, you can neither review books, nor reject papers, nor defend principles, nor perform duties, nor exercise rights with that freedom of volition which is the value of all literature, as it is the charm of all life; and what is inferiority under all these attributes but the admission that your journal is less a genuine offspring of the Profession than an *ill-omened* "*super-fœtation.*" In short, it is a *mistake* in whatever view we take of it, and the sooner it is abandoned the better for the fulfilment of the objects contemplated by the Association.

Not only is the Journal a mistake in relation to the interests of the Association, but it is also a great misfortune for all connected with it. How such excellent writers as Dr. Latham, Dr. Graily Hewitt, and others, can submit to the disjointed publication of their contributions, which appear sometimes at intervals of a month or more, I am at a loss to conceive. Think, too, of the pitiable position of the Editor. One pugnacious master urges an onslaught on the Homœopaths and those who meet them in consultation. Up starts another master, and denounces the Editor for his ignorance of consequences. "Why, it is the very thing the Homœopath desiderates—leave him in the mire, and he sinks—recognise him in any way, and you advertise the existence of one who otherwise might be thought dead." No doubt the Editor desires to conciliate each of his many masters—but he oftener fails than succeeds. Without the power of refusing the contributions of any one Associate, the pages of the Journal may be filled with matters the most puerile and theories the most absurd. A recent and remarkable example of this kind, is an article on the "Physiology of the Eustachian Tube." The first instalment of the theory of the writer, which has already appeared in at least three other periodicals, and read at as many societies, in the same identical language, was printed in our journal just five weeks ago, ending with the words "to be continued." The Associates will sustain no loss by the delay of No. 2; but doubtless the writer will imagine that he does. Our worthy editor, who is a man of extensive reading, knows very well that the paper in question is as old as the hills; but he cannot refuse to give it insertion.

Let us imagine an Associate sending for publication a paper on a new subject of high and immediate interest to the Profession, which is occupying more or less space in every other journal—however much our editor may desire to give it a place, the writer is obliged to be told that he must wait until his turn comes, and that it may be weeks before space can be found for his contribution.

As you truly observe, it is a satire to call such a periodical a Journal. But many believe that, without the Journal, there would be no Association. If so, the inference is that no such Association of Medical men is needed. For all the good we have done, this may be true; but for the cordiality and good-fellowship it promotes, as evidenced more particularly in the Branches, it is worthy of support and encouragement—and to extend its influence by increasing our numbers, I say emphatically, *drop the Journal.* Let the Association intelligence be forwarded weekly to each of the *bonâ fide* Medical Journals, and publish a monthly or quarterly record of transactions. As an inducement to the Medical Journals to publish our weekly intelligence, make it a *sine quâ non* that every member of the Association shall subscribe to any one of them, which may so far aid the objects of the Society; thus you will give an impetus to *legitimate* Medical journalism, and contribute greatly to the dissemination of professional knowledge. We shall then soon have ten thousand members, instead of two thousand, and ample funds for the furtherance of benevolent or scientific objects connected with our most noble Profession.

Aug. 4, 1862. One of the Rank and File.

MURDER OF A POOR LAW MEDICAL OFFICER.

To the Editor of the Medical Circular.

Sir,—Your kind insertion of my letter relative to the terrible death of poor Puckett, together with your leading article on the subject, have, I am happy to say, induced about 150 medical men,

and 100 of the nobility, members of parliament, gentry, and others, to forward nearly 400*l.* in aid of the fund for the support of the widow and family of the deceased; but as the interest from that sum, when invested, will be quite inadequate for their support, I am reluctantly compelled still further to urge their claims on the sympathy of the Profession and public at large, and trust a larger sum may yet be forthcoming, as, after the debts of the deceased are paid out of his own property there will only be left from that source a very few pounds, less than 10*l.* The family, in fact, are literally dependent on what we may raise for their support, as the widow's state of health precludes her doing anything. The maniac was yesterday tried for his life, and pleaded Guilty, at the same time saying, "I can't recollect." The Judge thereupon directed a plea of "Not guilty" to be recorded. The prisoner was then tried, and a verdict returned of "Not guilty on the ground of insanity;" and he was ordered to be detained during Her Majesty's pleasure.

Subscriptions by cheque, Post-office orders, or stamps may be forwarded to me or to Messrs. Elliott's Bank, Messrs. Williams' Bank, or the Wilts and Dorset Bank, all of Weymouth. Colonel Gilpin, M.P. for Bedfordshire, the Rev. E. C. Headland, rector of Broadway, where the deceased resided, the Rev. Talbot Baker, vicar of Preston, in which village the murder was committed, and other gentlemen, have kindly consented to act as trustees, and, therefore, no fear need arise as to the proper application of the money.

I am, &c., RICHARD GRIFFIN.

12 Royal Terrace, Weymouth, July 30, 1862.

MEDICAL SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JULY 2nd, 1862.

DR. TYLER SMITH, PRESIDENT, IN THE CHAIR.

DRS. GEORGE HARLEY and T. H. TANNER communicated

A REPORT ON A TWIN (?) ABORTION, EXHIBITED TO THE SOCIETY, BY DR. LANGMORE ON JUNE 4TH, 1862.

In this case a lady aborted on the 22nd of May, 1862. A fœtus, of about four months' gestation, was expelled; it was flattened, more or less atrophied, and had evidently been dead some time. The placenta was removed; and afterwards a smooth, soft body was peeled off the upper part of the uterine cavity, which proved to be a second bag of membranes. The chorion and amnion were unruptured, healthy, and transparent; and through them an embryo of about five or six weeks could be plainly seen floating in clear liquor amnii. The embryo appeared fresh and perfect, and not at all atrophied. Was this an instance of twin pregnancy or of superfœtation?

Drs. Harley and Tanner were directed by the Society to investigate the question. In their report these gentlemen give the results of an examination of the preparation. They then append some remarks on the structure of the decidua, and conclude thus:—"We are led to assume that the case under consideration is an example of superfœtation, for this reason: If the second, healthy, six weeks' ovum were the product of the same conception as the first four months' fœtus, which had been dead some time when expelled, then we must believe that although the latter perished some days before its expulsion, and manifested symptoms of putrefaction, yet the small second ovum died when six weeks old, was retained for about ten weeks afterwards, and nevertheless when removed was perfectly healthy, and did not present any trace of decomposition. We cannot subscribe to this improbable view. As, theoretically, we see no physical obstacle to the occurrence of superfœtation during the first three months of pregnancy, so we think the specimen now reported upon proves, as far as anything of the sort can prove, that superfœtation is a positive fact."

Professor HARLEY communicated a case of

ENORMOUS DEVELOPMENT OF HYDATIDS IN OMENTUM SIMULATING AN OVARIAN TUMOUR, BY DR. NEWMAN (STAMFORD).

A woman, forty-three years of age, began to suffer from enlargement of the abdomen eleven years ago. In 1861 an incision was made in the right iliac region, when a quantity of pus and hydatids escaped. The opening closed, but the abdomen again enlarged; and the patient died in May, 1862, with symptoms of acute peritonitis. On examination, the omentum was found stretched over a mass of glistening cysts. Masses of hydatids were embedded on the surface of the right hepatic lobe. From them ran an unbroken chain of cysts right across the spinal column and down into the left iliac fossa. The right ovary, as well as the mesentery, also contained hydatids.

DR. GEORGE HARLEY reported

A CASE IN WHICH AIR WAS EXPELLED FROM THE VAGINA.

The chief points in the case are these:—The expulsion of the air is accompanied with a loud noise, and, although odourless, is attended with great personal discomfort. It began about eighteen months ago, at a catamenial period, and has recurred with increasing severity at each period, until now there are several discharges in the course of a few minutes. The patient is married. The vagina was carefully examined in order to find if any communication existed between it and the rectum, but none was found. Dr Harley took a full-sized male catheter, to which was attached a long india-rubber tube with a stop-cock at the other end. The catheter was introduced into the uterus, the end of the tube with the stop-cock being placed in a tumbler of water. No air escaped when the instrument was in this position; but on placing the open end of the catheter in the vagina an instantaneous discharge of gas took place. Soon afterwards the water was found to be sucked up through the tube into the vaginia; and after one or two other experiments it was found that the vagina sucked-in and expelled the air by spasmodic action. It was further observed that the abdominal muscles materially assisted in producing this result; and although the patient has not the power of commencing the action, once it has begun and gone on for a few minutes, she has the power of continuing it.

Dr. DRUITT was glad to find that the phenomena of this case had been described by so acute and exact an observer, otherwise the case might have been narrated as one of physometra. He had once been consulted about the case of a lady who, after her confinement in a hot country, complained of want of sexual feeling, and likewise of discharges of air from the vagina. He had attributed both maladies to relaxation, and prescribed cold alum baths. Air would readily enter a relaxed vagina in large quantities; for example, when a woman was placed upon her hands and knees for the purpose of examination.

Dr. GRAILY HEWITT had seen a case of the kind mentioned by Dr. Harley. The lady to whom the passage of flatus from the vagina was very distressing, was the subject of enlargement and hypertrophy of the vaginal part of the cervix uteri. No fistulous opening existed between the rectum and the vagina. In this case Dr. Graily Hewitt considered that the air passed into the vagina by a kind of suction movement. The rigid flat roof of the vagina constituted by the indurated cervix acted as a dilator of the vagina; when during certain movements of the body the uterus was drawn upwards, air entered the vagina.

Dr. BRAXTON HICKS remarked that the admission of air into the vagina was by no means rare. It might be witnessed not unfrequently in those whose vulvæ were lax and uteri heavy, when they lie down on the examining couch; the weight of the uterus causing it to fall on the sacrum in the recumbent posture, whereby air was drawn in; while on assuming the erect position it was expelled again by the descent of the uterus.

CARBONIC ACID GAS AS AN ANÆSTHETIC.

M. Ozanam, in 1856, stated his belief that of all the anæsthetics most apt to produce a sufficient insensibility, without any danger, the mixture of carbonic acid and atmospheric air constituted the best. In his present communication, he relates a case of deep-seated abscess of the thigh, calling for elaborate operation, in which he employed a mixture of three parts carbonic acid, and one part air, the apparatus employed not, however, completely closing the mouth and nostrils, so that some additional air could be inspired. Insensibility occured in about two minutes, the respiratory action having become accellerated, while the face was covered with sweat. The loss of consciousness continued complete as long as the inhalation was continued, the patient immediately recovering his senses on the removal of the tube.—'Comptes-Rendus,' No. 21.

NEW SYMPTOM OF SCARLATINA.

M. Bouchut mentioned to his class a diagnostic symptom, which he had never found fail, to enable him to distingnish scarlatina from many other exanthem, and the knowledge of which may prove of utility in doubtful cases. "It is the disappearance of the eruption for a minute or two under the influence of slight friction. If, with the point of the finger or the nail, we trace, a line, this becomes, and remains for a minute or two, white amidst the surrounding redness of the skin. We can, so to say, write the diagnosis of the affection on the skin, as in the present case, in which the word 'scarlatina,' traced by a bit of wood, became in a few seconds designed in white letters, which remained quite distinctly visible for about two minutes. This is due to the exaggeration of the contractility of the capillaries, induced by the friction temporarily expelling the blood from the interior. Nothing of the sort is observed in measles, erysipelas, or other cutaneous eruptions, in which the half-paralysed capillaries possess but little contractility. We can in these, by pressure, drive out the blood from the capillaries, and produce a white spot; but this is a purely mechanical action, and as soon as the pressure is removed the redness reappears."—'Gaz. des Hop.,' No. 70.

SEVERE WOUND OF THE HEAD. — In a recent fight with the Borneo pirates, one man was brought up with the top of his skull clearly lifted up by the blow of a Sooloo knife as if it had been done *secundum artem* by an adept at post-mortems, who wished to have a peep at the dura mater *in situ*. It was like the lid of a box partly open, and required considerable force to shut it, and to get it into its right place again. The man was living and likely to recover.

GAS FROM PETROLEUM is about to be introduced in New York. It is stated that the cost is about one-half of that of the gas at present in use.

Births, Marriages, and Deaths.

BIRTHS.

BURKE.—On the 15th ult., at the Royal Naval Hospital, Malta, the wife of John Page Burke, M.D., of a daughter.

CHILD.—On the 27th ult., at Oxford, the wife of Gilbert W. Child, M.D., of a daughter.

OLDFIELD.—On the 5th of June, at Kathmandhu, Nepaul, the wife of Dr. Oldfield, of a son.

MARRIAGES.

DAVEY—ROBINSON.—On the 29th ult., at St. Saviour's, Paddington, Alexander George Davey, M.D., of Ryde, Isle of Wight, second son of Richard Gibbon Davey, Esq., M.R.C.S., of Walmer, to Penelope Susan, eldest daughter of the late John Robinson, Esq., of the Firs, Dudley, Worcestershire.

HOMFRAY—LEWIS.—On the 24th ult., at the Parish Church, Wiscombe, Bath, C. A. Homfray, Esq., M.R.C.S., of Tredegar, Monmouthshire, to Anna Maria, second daughter of the late F. O. B. Lewis, Esq., Surgeon, of Cromamman, Linnelly, Carmarthenshire.

JAKINS—HOBBS.—On the 1st of May, at the residence of the bride's father, George Sargent Jakins, Esq., second son of I. N. Jakins, Esq., M.R.C.S., of Osnaburgh street, Regent's park, to Eliza, youngest daughter of the Rev. John Hobbs, of Auckland, New Zealand.

KEITH—FISKIN.—On the 29th ult., at Albyn place, Aberdeen, William Keith, M.D., of Easter Muchalls,, Kincardineshire, to Isabella Fiskin, relict of William Williamson, Esq., late of Breadalbane, Victoria, Australia.

MAY—ROBINSON.—On the 24th ult., at St. Mary's, Reading, George May, jun., B.A., M.B., to Mary Sophia Georgiana, daughter of Wm. Robinson, Esq., of Oxford Lodge, Reading.

MORGAN—WILLIAMS.—On the 29th ult., at the Parish Church, St. George's, Hanover square, the Rev. Samuel Christopher Morgan, Curate of Newland, Gloucestershire, to Sophia Janet, eldest daughter of C. J. B. Williams, M.D., F.R.S., of Upper Brook street.

SYKES—CHAMBERS.—On the 24th ult., at St. Barnabas Church, Homerton, George Sykes, M.D., Surgeon to the Queen's Own Light Infantry Militia, to Sarah Anne, eldest daughter of George Chambers, Esq., of Park House, Downs Park-road, Lower Clapton.

DEATHS.

CUMMING.—On the 24th ult., at Limehouse, Ann, the wife of W. S. Cumming, Esq., M.R.C.S., aged 68.

KANE.—On the 21st ult., at Bath, Caroline Anne Kane, wife of Wm. Kane, M.D., youngest daughter of Brigadier-General C. Dallis, and granddaughter of George Cockburn Haldane, Esq., of Gleneagles, Perthshire.

MACKLIN.—On the 26th ult., Charlotte Susanna, widow of the late Chas. Macklin, Esq., Surgeon, of Buntingford, Herts, aged 73.

SMITH.—On the 25th ult., at Portland House, Cheltenham (the residence of his father, Thomas Smith, M.D.), Thomas Johnson Smith, M.D., aged 24.

WAGSTAFFE.—On the 13th ult., at Braunston House, Braunston, Rugby, Mathew French Wagstaffe, Esq., M.R.C.S., of Walcot place, Kennington, aged 59.

WATERLAND.—On the 22nd ult., at Burton-upon-Stathez, Henry John Waterland, Esq., M.R.C.S., late of Kirton-in-Lindsey, aged 38.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—The following gentlemen passed the Preliminary Examination in the subjects of General Education on the 26th ult.:—Charles Bracebridge Allen, Dartmouth street, Westminster; Edgar William Beckingsale, Newport, Isle of Wight; Frederick Royston Fairbank, Elborow street, Rugby; Henry Reginald Hatherly, Westminster Hospital; Thomas Richardson Loy, Havering, near Romford; David Sharp, London road, St. John's wood; Godfrey Bingley Wadsworth, University College.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen, having undergone the necessary examination for the diploma, were admitted Members of the College at a meeting of the Coles, Court of Examiners on the 29th ult.:—Robert William Staleybridge, Cheshire; Thomas Gambier, Canterbury; John Heaps, Beeston hill, near Leeds; Thomas Henry, Wrexham; Theodore Kelsall Hubert, Markgate street, Beds; Martin Annesley Lamb, Porchester terrace; Robert Turner Land, Leeds; Henry Lyell, Southwark; Robert Samuel Macpherson, Birmingham; Geo. Manbey, Shepherd's bush; Thomas Pickering Pick, Waterloo, near Liverpool; John Prince, Calcutta; William Rayner, Uxbridge; William John Ready, Dublin; Samuel Smith Crosland Richards, Bedford square; William Dunnett Spanton, Loughborough; James Hudson Taylor, Barnsley; Francis Trimmer, Gloucester; Thomas William Wasdale Watson, Edmonton; Frederick William Wright, Launceston. The following gentlemen were admitted Members on the 30th ult.:—James Charles Broadbent, Liverpool; John Norman Davis, Galway; Reginald Rabette Dudley, Whitchurch, Hants; Ralph Eddowes, Shrewsbury; William Lewis Evans, Rhayader, Radnorshire; Richard Fenelly, Kilkenny; William Richard Grove, Huntingdon; George Annesley Derville Mahon, Aspley, Woburn; Abney Charles Hopton, Judd street, Brunswick square; Henry Edward Jessop, Cheltenham; Francis King, Stratton, Cornwall; Thomas William King, Camberwell; Samuel Mason, Lewisham road; William Lugar Mumford, Cornard-Pava, Suffolk; Charles Orton, March, Cambridgeshire; John Pratt, Sunderland; Peter Proctor, Leeds; Charles Richards, Almer, Blandford; Horace Newbegin Watts, Norwich; Henry Charles Woods, Godalming.

APOTHECARIES HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on the 24th ult.:—John Anderson, Green Heys, Manchester; William Alfred Elliston, Ipswich; John Alexander Hedges, Adelaide-place, Bedford; Henry Frederick Hodgson, Cradley-heath, Staffordshire; Nathaniel Hellings, Tiverton, Devon; Richard Meredith, Netherton, Worcestershire; Ebenezer Mark Thompson, Billinghay, Lincolnshire.

The following gentlemen also on the same day passed their first examination:—James Herbert Brown, St. Bartholomew's Hospital; John Foot Churchill, Charing-cross Hospital; Ernest Arthur Hudson, St. Mary's Hospital; George F. W. Meadows, Guy's Hospital; Charles James Wright, Leeds.

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH: DOUBLE QUALIFICATION.—The following gentlemen have passed their First Professional Examinations during the July sittings of the Examiners:—Smith Houston Davson, Demerara; Samuel J. Dunn, Co. Tyrone; Wm. J. Kennedy, Londonderry; Geo. R. Lloyd, Co. Tipperary; Charles J. Welsh, Northampton.

The following gentleman passed his First Professional Examination in April:—James Hunter, Ayrshire.

The following gentlemen have passed their Final Examinations, and been admitted L.R.C.P.E. and L.R.C.S.E.:—Frederick John Austin, Limerick; James Watt Black, Banffshire.

ROYAL COLLEGE OF SURGEONS, EDINBURGH.—The following gentlemen have passed their First Professional Examinations during the July sittings of the Examiners:—Alexander Allison, Strathaven; A. Montgomerie Bell, Edinburgh; John Buckley, Cork; Lewis Cameron, Morayshire; Robert M'K. Duncan, Dumfries; William Erskine, Fifeshire; James Godfrey, Glasgow; Alexander Goodall, Fifeshire; H. Fred. Harden, Weymouth; David Erskine Hughes, Edinburgh; James G. Lyon, Forfar; James R. M'Alman, New Brunswick; John W. Maxham, Quebec; N. G. Mercer, Argyllshire; Roderick M'Laren, Dumfries; Frederick Montizambert, Quebec; Robert Thin, Kilconquhar; Andrew Veitch, Edinburgh; Robert Wright, Edinburgh.

The following gentlemen have passed their Final Examinations, and obtained the diploma of the College:—Patrick Macdonald Allen, Arbroath; John Daly Ambrose, Co. Limerick; Alexander Brebner, Aboyne; Michael Breen, Co. Clare; Wm. Oxendale Dawson, Preston; James Dewar, Edinburgh; Daniel Donovan, Skibbereen; Frederick Heisch Dunbar, Cork; John Duncan, Edinburgh; Geo. Jonathan Hearder, Plymouth; James Sommerville Hope, Tasmania; Patrick C. Houston, Morayshire; Jas. Robertson MacIver, Ross-shire; Robert Macnair, Paisley; Arthur Grant Reid, Fochabers; Wm. Geo. Ross, Bury St. Edmund's; J. G. Smith, Kirkcudbrightshire; James Smith, Dumfriesshire; Wm. Thomson, Ballynahinch; John Todd, Tyrone; Richard Sobey Veale, Cornwall; John Thomson Welsh, Edinburgh.

ST. HELIER'S, JERSEY.—The members of the Medical and Surgical Society held their Annual General Meeting on the 25th inst., at the Society's rooms, in Bath street, and elected the following office-bearers for the ensuing year:—*President*—Dr. Charles Vaudin; *Vice-Presidents*—Drs. Alexander Leigh and Dr. M. Blood; *Treasurer*—Dr. Kitchener; *Secretary*—Dr. H. J. Hirschberg; *Council*—Drs. Joseph Dickson, John Tixott, Alexander Low, John Le Cronier, and Alfred Godfray.—July 26, 1862.

APPOINTMENTS.—John Bolland, L.R.C.P. Edin., L.R.C.S. Edin., L.A.H. Dub., L.M. Roy. Hosp., has been elected Medical Officer and Public Vaccinator for District No. 1 (including the Workhouse) of the Daventry Union, Northamptonshire, *vice* Sylvester R. Skinner, M.R.C.S. Eng., and L.M., L.S.A. Lond., resigned.—George Fearnley, M.D. Heidelberg, M.R.C.S. Eng., L.R.C.S. Edin., L.S.A. Lond., has been elected First Mayor of Dewsbury, Yorkshire, that town having recently obtained a Charter of Incorporation.—John Davies Harries, M.R.C.S. Eng., L.S.A. Lond., Associate of King's Coll. Lond., has been appointed Surgeon to the Salop County Prison, *vice* Henry Fenton, M.R.C.S. Eng., L.S.A. Lond., resigned.—John Lambert, L.F.P.S. Glasg., has been appointed Dispenser to the Royal Portsmouth, Portsea, and Gosport Hospital, Portsmouth, vice Mr. Thomas David Bennett, resigned.—Gustavus Charles Phillips Murray, M.D. Univ. Edin., M.R.C.S. Eng., has been appointed a Physician Accoucheur to the St. George's and St. James's Dispensary, King street, Regent street, *vice* William Hamilton Roe, M.B. Oxon., M.R.C.P. Lond., resigned.—Walter Jeffery Potts, M.R.C.S. Eng., has been elected Medical Officer and Public Vaccinator for No. 5 District of the East Grinstead Union, Sussex, *vice* Mungo Parr, M.B. Mar. Coll. Aberd., L.R.C.S. Edin., L.S.A. Lond., resigned.—David Rice, M.R.C.S. and L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Harbury District of the Southam Union, Warwickshire, *vice* William James Shone,

M.R.C.S. Eng., L.S.A. Lond., resigned.—William Frederic Teevan, F.R.C.S. Eng. (exam.), B.A. Univ. Lond., has been appointed a Surgeon to the St. George's and St. James's Dispensary, *vice* Christopher Heath, F.R.C.S. Eng., resigned, and Demonstrator of Anatomy at the Westminster Hospital.—William Sowerby Wallen, M.R.C.S. Eng., and L.M., L.S.A. Lond., has been appointed Medical Officer and Public Vaccinator to the West District and Workhouse, Rotherhithe, Surrey.—John Watson, M.R.C.S., has been appointed District Surgeon to the Salford and Pendleton Royal Hospital and Dispensary, *vice* Mr. Booth, resigned.—Nicholas Warburton White, M.R.C.S. Eng., L.A.H. Dub., L.M. Dub., has been elected Medical Officer to the Macroon Dispensary District, County Cork, *vice* Valentine MacSwiney, M.D. Univ. Edin., L.R.C.S. Edin., deceased. —Aldborough Lloyd Williams, M.R.C.S. Eng., has been appointed Surgeon to the Cheltenham General Hospital and Dispensary, *vice* Walter Jessop, M.R.C.S. Eng., deceased.—Assistant-Surgeon S. W. Wyndowe has been appointed Civil Surgeon of Malabar, *vice* Cleveland, resigned.

Manchester Medico-Ethical Association.—The following petition was presented to the House of Commons, on Monday, July 21, by Thomas Bazley, Esq., M.P.:—"To the Honourable the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled. The petition of the undersigned, on behalf of the Manchester Medico-Ethical Association, humbly showeth, that the Act passed in the year 21 and 22 Vict., cap. 90, entituled 'An Act to regulate the Qualifications of Practitioners in Medicine and Surgery,' and generally cited as 'The Medical Act,' has, after four years' experience, been found inadequate to the requirements of the Medical Profession, and the welfare of the public. That whereas the preamble to the said Act states, that 'it is expedient that persons requiring Medical aid should be enabled to distinguish qualified from unqualified Practitioners,' the Act itself fails to define the titles and qualifications of such Practitioners. That one great feature of the 'Medical Act' having been the formation of a 'General Council of Medical Education and Registration,' yet a recent instance seems to show that there are no satisfactory powers to compel the various licensing bodies to conform to the requirements of such Council. That whereas the Act forbids the assumption of Medical titles by unqualified and unregistered psrsons, the 40th Clause has been decided by the Judges of the higher Courts to have failed in its intentions, and to be inoperative. That whereas the 36th Clause forbids the appointment of unregistered persons to public services—Hospitals, clubs, emigrant vessels, and in other ways, no provision has been made whereby this clause can be enforced. That although the said Act professes to protect 'persons requiring Medical aid' from incompetent and unqualified persons, yet it nowhere attempts to prevent or prohibit the practice of Medicine or Surgery by such incompetent or unqualified persons. That a competent knowledge of both Medicine and Surgery is indispensable to the practice of the Medical Profession, and yet the Act allows persons to register who may have undergone the test of fitness by examination in one of the branches of the Profession only. That the word 'Surgery' is very commonly used by unqualified and unregistered persons as a public inscription or sign on or about their dwellings or places of business, thereby misleading the public whom it is the intention of the Medical Act to defend, and the said Act contains no provisions to meet this evil. That offences under the penal clauses of the said Act are proveable by 'implication only,' which is generally deemed unsatisfactory by the Judges. Your petitioners therefore humbly pray, that in consequence of the above-cited and other deficiencies in the said Medical Act, and its admitted failure, after four years of patient trial and experience of its workings, your Honourable House will give its attention to the subject, and devise such measures to prevent existing abuses as shall, in its wisdom, seem most fit. And your petitioners will ever pray, &c., James Lomax Bardsley, Knt., M.D., *President;* Joseph Stone, M.D., and Jonathan Wilson, F.R.C.S., *Hon. Secs.*—Manchester, July 18, 1862."

Criminal Abortion.—Fanny Worbey, thirty-two years of age, was charged, at the Westminster Police-court, with being an accessory before the fact to the felonious using, by a man named Morgan, of an instrument to promote miscarriage. On May 28th, the prisoner came to the house of Mrs. Darby, 12, Bessborough place, Vauxhall Bridge-road, stating that she had visited London to see the Exhibition, and took lodgings there. On June 7th the prisoner became so alarmingly ill that Mrs. Darby sent for Mr. Hunt, Surgeon, 108, Tachbrook street, Pimlico. He found the accused labouring under the effects of miscarriage. The hæmorrhage was excessive, and she became so ill in the course of a few hours that it was apprehended she would not survive the night. The prisoner, while under the fear of death, made a confession, in the presence of Mr. Hunt and Sergeant Huddy, of the B division, which was taken down in writing, and signed by her, stating that she had visited a man named Morgan, at 16, Moreton terrace, who had two or three times used an instrument to her, which had given her great pain. He had recourse to a particularly large one on the last occasion, and the moment she got home her illness came on. She added to the landlady, that she had been to Morgan eighteen months ago, and that he had procured abortion for her then. The prisoner, who is still very ill, said, in reply to the charge, that she was not in a proper condition to make a statement at the time the one produced was taken down. Mr. Hunt and Sergeant Huddy had made several mistakes. The prisoner was fully committed for trial at the Central Criminal Court.

Typhoid Fever and House Drainage.—Perhaps I may be here allowed to make a few remarks upon the existing system of house drainage. First, I would suggest that sewers should not be constructed under the floors of dwelling-houses. If constructed of brick, the mortar may in time crumble away, or be destroyed by rats. If constructed of glazed pipes (no other should be used), and the junctions are not properly cemented, drainage may leak out, or sewer gases may be admitted into the house. In an instance occurring in the gravelly portion of this district (Sydenham), a house was newly drained into the sewer, glazed pipes were placed under the floor of the house, some two feet deep in the soil, but the flanges were not properly cemented. Sewer smell was observed in the house. Several cases of scarlatina occurred, which took on a malignant form, and two children died. Secondly, the ordinary traps to sinks are inadequate, from their lightness, and from the facility with which they can be removed by servants, to prevent the entrance of sewer gas into the house, therefore sinks should never be allowed to communicate directly with the sewer. The pipe leading from the sink should, after passing through the outer wall, hang over a trapped gulley, or receiver. A strong ordinary stone dip trap, being the best form; from which accumulations of fat or other refuse, could be periodically removed, or into which disinfectants could be poured. In an instance in this district, a very unpleasant smell was observed in a house which had been recently, and, as was supposed, perfectly drained into the sewer which in this situation is oval, four feet in height, and well ventilated; although the drain was more than once examined, no cause could be found for the disagreeable odour, until upon one occasion, the master of the house was looking round at night, when he detected a bubbling clicking sound in the back kitchen, and, after some time, discovered that the sewer air was lifting the small bell-trap of the sink, and thus discharging itself into the house. This was remedied by introducing a pipe and conducting the sewer air above the roof of the house. Thirdly, water-closets in houses oftentimes from their imperfect construction allow sewer air to enter houses—they should be always ventilated. The soil-pipe should be always constructed outside the house; never, as in some cases, in the interior of the wall. Houses should always be ventilated upon the upper landing by a trap into the roof, or by some covered communication with the open air, the opening to which could be regulated according to the external temperature, so that a supply of pure fresh air could be admitted when the windows are closed for the night. An excellent plan is also suggested by my friend Mr. Roger Smith, architect, viz., that air flues should be constructed by the side of the chimney to the top of the house from each room.—*Dr. Wilkinson in London Medical Review.*

Sanitary Statistics of Tasmania.—Invalids from India, China, and the hotter colonies of Australia, if not past recovery, speedily rally in Tasmania, and the increased appetite for food is the first and most surprising change. With such clear skies, abundance of ozone, bracing sea breezes, the lamp of life burns quickly as well as brightly, and demands a much more abundant and nutritious supply of food than suffices elsewhere. Food of the best and most varied kind is plentiful, and the actual consumption per individual greatly exceeds the highest European calculations. Tasmanians spend much of their time in the open air, and many of the diseases which afflict European communities are unknown. Others have a minimum of intensity. Over-crowded, ill-ventilated, and badly victualled ships have at different times brought to this port dangerous types of fever; but the contagious emanations arising have speedily been neutralised by the disinfecting power of our highly ozonised air, and beyond a few who came directly in contact with the first sufferers landed, the disease has not spread. Even eruptive fevers, scarlatina, and measles, though frequently imported, and at times severe, have speedily worn themselves out only re-appearing at long intervals, and in mild type. In 1854, measles were epidemic. At the beginning of last year we had, another visitation, but so much was it mitigated in this island, that out of a population of about 25,000 persons in the Registration District of Hobart Town, only 55 persons of all ages died of it. The children under seven years of age alone, and, therefore, all liable to the infection, amount to nearly 6,000—but many above that age, and adults, were attacked, and some of the deaths in Tasmania is greatly below that of the neighbouring colonies and England. The Tasmanian born are comparatively little subject to pulmonary consumption, except where the hereditary tendency is strong. The colony is not yet old enough to show what age the native born may attain to, but there is reason to think it will be high. Numerous instances of centenarians who have resided in the island from its first colonisation, or other very long periods, have come under my notice. Though adult males have always so much exceeded adult females in number, the increase of population, by excess of births over deaths, has been at a rate much greater than

prevails in Europe. Last year the increase was about 2,000 in a population of less than 90,000. The children of Tasmania are as plump and rosy as the finest specimens in England, and the rosy cheeks does not disappear in adult life. . . . 1,479 deaths out of a population of 89,977 persons is at the rate of 16·43, or less than 16½ per 1,000, so that the mortality rate of all Tasmania is less than that of the 63 healthiest registration districts of England and Wales—17 per thousand—which the Registrar-General of England adopts as a normal standard for death rates. In the purely rural population of Tasmania, counting exclusive of those associated with the urban districts of Hobart Town and Launceston—53,667—the deaths in 1861 amounted only to 619—being at the rate of 11·53, or 11½ per 1,000. Glendale, in Northumberland, which has the smallest death-rate in the English returns, has 15 per 1,000. But even this contrast, favourable as it is to Tasmania, does not exhibit the whole superiority; for, though our population table, when compared with that of England, has not as large a proportion of persons above 60 years of age, it has a very much larger proportion of those under 15 years of age. Again, the smallest rate last year in any district of Tasmania was in that of Oatlands, which, in a population of 2,333, had only 17 deaths, being at the rate of only 7·58 per thousand, or less than half of the healthiest district in England. Oatlands is in the centre of the island, and 1,308 feet above the sea level. It is an axiom now, in sanitary science, that the rate of mortality in children, under five years of age, gives the most delicate and surest test of the salubriousness of any climate. In England, the death-rate under this age is 65·18 per 1,000; in Tasmania, not quite 38 per 100, or 37·93. Did my limits permit, I could for every disease in our mortuary records give the rate as compared with those in the English tables. In an elaborate article on the Vital Statistics of Tasmania, published in the April number, 1858, of the 'Australian Medical Journal,' I made such a contrast for 1855 between Hobart Town and London. The additional facts I have stored since that period have fully confirmed, and in many respects strengthened, the very favourable report I then made of the natural salubrity of this island. I by no means wish to convey the impression that the laws of hygiene may, in this auspicious climate, be trifled with with impunity, any more than in other countries; indeed, I have frequently published indubitable proofs to the contrary. In this picturesque island and genial climate, it must be man's own fault if the best health and highest "chances of long life" are not attained. The meteorological, statistical, and sanitary facts I have compiled in this paper, briefly condensed as they necessarily are, give convincing proof of the correctness of the statement which concluded a paper of mine to the London Statistical Society some years ago, that few countries in the world, whose medico-vital statistics have been published, can equal this beautiful isle of the south-sea—young Tasmania—as an abode where the human race may dwell comfortably, healthily, and to a ripe old age, without deteriorating, either physically or morally, from the elevated position their British progenitors hold among the nations of the earth.—E. S. Hall.

The Curragh Camp.—A writer in the *Times* says:—"It has been written '*Dulce et decorum est mori pro patria*,' but this does not refer to dying of consumption or rheumatism from the effects of a mock campaign on the Curragh of Kildare. Of what avail are soldiers' libraries, institutes, etc., if a man gets wet through before he can reach them, and is wet through again returning to his tent, where he has no means of drying himself? I may also mention another thing. A great deal has been written and spoken with regard to the improvement of the moral condition of the private soldier, and no doubt food for the mind in the shape of libraries, reading rooms, etc., is a very good thing; but I think the general opinion of the soldiers themselves is, that if the money laid out in food for their minds were expended in giving them an extra half-pound of meat, it would do them a great deal more good."

Nicotine—its presence in the Organs of a Snufftaker.—M. Morian, of Rouen, in the case of a man of seventy years of age, resolved to ascertain, after death, if nicotine could be detected. Having reduced the lungs and liver separately into pulpy masses, he treated the former with sulphuric acid, and the latter with oxalic acid, both much diluted. Subsequent manipulations proved the presence of nicotine in both instances.

APPOINTMENTS FOR THE WEEK.

Wednesday, August 6.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopædic Hospital, 2 p.m.

Thursday, August 7.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

London Surgical Home.—*Operations:* 2 p.m. Ruptured Perinæum; Vesico-Vaginal Fistula.

Friday, August 8.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, August 9.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital 2 p.m.

Monday, August 11.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1¼ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, August 12.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

Hints for Clinical Clerks in Medical Cases. London: John Churchill, New Burlington street.

Thirty-second Annual Report of the Belfast District Hospital for the Insane.

Glasgow Medical Journal. No. XXXVIII.

Results of an Experimental Enquiry into the Homœopathic Treatment of Diseases. By Dr. G. Lade. London: H. Turner and Co., 77 Fleet street.

Patent Foul Air, Smoke, and Gas Expeller. By *Giachosa*. Leamington: J. Glover.

NOTICES TO CORRESPONDENTS.

A Subscriber.—The witness having been regularly subpœned was entitled to the fee. The Coroner may call a dozen witnesses if he please; but if he call them he must pay them.

Chirurgus.—1st. Glaucoma is commonly caused by arthritic inflammation;—at least, so think German authorities, and we have seen marked instances of it. The use of ardent spirits may also induce it.—2nd. Advanced cases are, we believe, incurable, notwitstanding all the ophthalmological novelties that have been introduced.

Dr. J. S.—1st. Yes.—2nd. Yes.

A Reader.—We must decline to give an opinion on the case.

Veterinarius.—The paper is unsuitable. We are obliged, however, by the compliment.

A. P. is thanked.

To the Editor of the Medical Circular.

Sir,—I observe that you are disposed to criticise the poliey, if not the right, of an Association instituted for Medical purposes, to publish a Medical journal on its own hook. Nothing could be more easy than to smash, at once and for ever, so needless and so expensive a luxury. Let the conductors of the legitimate Medical journals—the 'Lancet,' 'Medical Times,' and Medical Circular—refuse the contribution of any man who writes in the obnoxious print, or who in any way upholds it, and they at once put an extinguisher on its existence. Moreover, I feel sure that if the writers themselves were to consider the question fairly, they would be the last to assist in perpetrating an injustice, and would not require any such a negative as I have suggested. Dr. Latham—one of the present contributors to this spurious journal—is not even an associate. Follow up the subject, Mr. Editor, and, rely upon it, the guineas of the Association will soon be more profitably expended. Yours, &c.,

July 30, 1862. Fairplay.

Tyro.—1st. It is unnecessary.—2nd. We cannot give you the information.

W. H.—We have perused the artiele on "Force" alluded to; but it is too long for republication; we may however, give portions of it when an opportunity offers.

Dr. S. B.—Received, and letter forwarded.

An Old Member should make known his views at the meeting now being held in London.

Physicus.—1. Dr. Richardson's inference from his experiments that endo-carditis and acute rheumatism were produced by the injection of lactic acid, has not been confirmed by the observations of German physiologists. Having examined dogs that had died in a healthy state, they found the same condition of the valves of the heart which had been erroneously attributed exclusively to the operation of lactic acid. The foundation of your remarks is, therefore, shaken.—2. Not unlikely.

To the Editor of the Medical Circular.

Sir,—I have been in the habit of translating the words *urgenti dolore, when in pain*, but a former assistant would have it *when the pain is troublesome*, and he who is with me at present, maintains that it should be *when the pain is urgent*, which is right? I have a notion that pain is always troublesome or urgent, and to speak of it in these terms, is something like saying, when water is wet, or when fire is hot, &c., &c. I am, &c., Publius.

Tunbridge, Kent, July, 1862.

[The literal translation of the words is "pain being urgent," the meaning of which is too obvious to require explanation. Pain may be continuous, but also subject to exacerbations, and it may be desirable to give a full dose of the sedative, only at the time of an exacerbation.]

Nux.—The whole income of the Association goes to support the Journal. Your propositions should be brought before the members.

M. W. C.—Dr. Pavy's combination of almonds and eggs for diabetes is the most agreeable food of the kind that we have seen. The physiology of diabetes is yet so obscure, that we cannot predict with any certainty that this bread will be especially advantageous. Experience is the only guide. Some physicians have treated diabetes with large quantities of sugar, and have declared that they have cured their patients.

M.R.C.S. Eng., and L.S.C.—1st. No.—2nd. The appointments are permanent

Bowles and Sons, Label and

GENERAL PRINTERS, ENGRAVERS, &c., GEORGE STREET, MANSION HOUSE, LONDON, E.C. —Surgeons, Hospitals, and Dispensaries supplied with Gummed Labels and every description of Printing on highly advantageous terms, and of the most finished style and workmanship.

Everyone should therefore provide against them

THE RAILWAY PASSENGERS ASSURANCE COMPANY

Grant Policies for sums from £100 to £1,000, Assuring against

ACCIDENTS OF ALL KINDS.

An Annual payment of **£3**, secures **£1,000** in case of DEATH by ACCIDENT, or a Weekly allowance of **£6** to the Assured while laid up by Injury.

Apply for Forms of Proposal, or any information to the PROVINCIAL AGENTS, the BOOKING CLERKS at the RAILWAY STATIONS, or to

The Head Office, 64 CORNHILL, LONDON, E.C.

£102,817 have been paid by this Company as COMPENSATION for 56 fatal Cases, and 5041 Cases of Personal Injury.

The SOLE COMPANY privileged to issue RAILWAY JOURNEY INSURANCE Tickets costing 1d., 2d., or 3d., at all the PRINCIPAL STATIONS.

Empowered by Special Act of Parliament, 1849.

64 Cornhill, E.C. WILLIAM J. VIAN, Secretary.

The Mutual Loan Fund

ASSOCIATION (Incorporated 1850) 14 Great Russell street, Covent garden, W.C., lends Money on Personal Security, Household Furniture, Deposit of Deeds, &c. Proposals received without inquiry fees, and no reduction made for interest. The large cash capital of the Association enables the Company to complete its transactions immediately, above £300,000 having been advanced without life assurance, or in attendant expenses. Forms of proposal containing full information, free, or forwarded on receipt of a directed stamped envelope.

EDWARD HARPER, Secretary.

Tenants are recommended

TO BUY THE HOUSES THEY LIVE IN, instead of paying rent from year to year, and having nothing to show for it at the expiration of their tenancy. By borrowing the necessary capital of the MUTUAL LOAN FUND ASSOCIATION, 14 Russell street, Covent garden, and repaying the same by quarterly instalments of little more than would otherwise be paid as rent, any tenant may become the landlord in a period varying from eight to fifteen years. In like manner mortgages may be at once got rid of and the borrowed capital returned by instalments easy of being met. For all particulars apply to (enclosing a stamped envelope)

EDWARD HARPER, Secretary.

Flour — (Essex) — Warranted

free from adulteration, to any part of London (not less than 14lbs.) carriage free. Whites, for pastry, per bushel (56lbs), 0s. 4d. Households (recommended for bread-making), 9s. 8d.; Seconds, 9s. 0d.; Wheat Meal for brown bread, 9s. 0d. Best fine and coarse Scotch Oatmeal. Address HORSNAILL and OATCHPOOL, Bulford Mill, Witham, Essex, or 355 Goswell road, City road, E.C. Directions for bread-making gratis. Terms Cash. A half-sack delivered free to any rail station 200 miles. German Yeast.

Surgical Instruments.—

J. ARNOLD continues to supply Instruments of the best workmanship at moderate prices, manufactured on the premises under his own superintendence.

J. ARNOLD, 35 and 36 West Smithfield, E.C. Established 1819.

E. Burton and Co.'s Optical,

MATHEMATICAL, and PHOTOGRAPHIC INSTRUMENTS cannot be surpassed at the prices charged. A Catalogue for two stamps, or on application at the Manufactory, 47 CHURCH STREET, MINORIES, E., London.

Messrs. Nicholson and Co.,

Wholesale Chemists, 5 Dean street, Oxford street, London, Sole Agents for KEITH and CO.'S CONCENTRATED ORGANIC REMEDIES; also, the New Work by GROVER COE, M.D., being a Practical Exposition of the Therapeutical Properties and Clinical Employment of these invaluable preparations.

Sole Original Makers of the LIQ. COPAIBÆ et BUCHU et CUBEBÆ, miscible with distilled water, clear and does not nauseate. LIQ. ANTIPSORIC, a perfect specific for Scabies, without any smell of sulphur. LIQ. ERGOTÆ never fails, and equal in strength to the powder. Ozonized Ol. Jecoris Opt., only 1s. 19d. per lb.

All the New Remedies, Concentrated Infusions, etc.

To Surgeons, Dentists, Students, and others.

The best House for Second-

HAND INSTRUMENTS, where there is the largest Stock in London, is Mr. WM. LAWLEY'S, 78 Farringdon street, City. Army and Navy Regulation Cases, Pocket Cases, Dissecting Cases, &c. &c. And, if you require NEW INSTRUMENTS, the well-known House of MILLIKIN & LAWLEY, 161 Strand, adjoining King's College, is the best in London, where every description of Instrument or Surgical Appliance may be had on the most recent principle and the shortest notice.

N.B.—A large Stock of first-class Instruments always on Sale, at the lowest cash prices. Instruments Bought, Sold, or Exchanged.

Medical Fixture and Glass

WAREHOUSE.—W. HAY, 25 Little Queen street, Lincoln's inn fields, begs to inform the Profession that he Fits-up every description of Medical Shops and Surgeries, and has in Stock a large assortment of New and Second-hand Drawers, Counters, Desks, Dispensing Screens, Bottles, Jars, and every requisite for the above.—A large Assortment of Medical Lamps.

Millikin, late Bigg and Millikin,

Surgical Instrument Maker and Anatomical Machinist to Guy's and St Thomas's Hospital, No. 9 St Thomas's street Southwark S.E.

GUARANTEED

PURE CONFECTIONARY.

The best guarantee of the quality of an article is the Manufacturer's Name, the Public should therefore buy

WOTHERSPOON'S

VICTORIA LOZENGES,

Flavoured with Peppermint, Cinnamon, Lemon, Rose, Ginger, Clove, Musk, Lavender, and a great variety of the finest Essences.

In packets at 1d., 2d., 4d., 8d., and 1s. 4d. each.

WOTHERSPOON & CO., GLASGOW AND LONDON.

Labels Cut by Machinery.—

Adhesive for marking goods, 1s. per 1,000; Dispensing or Chemical, 2d. per 100, kept in stock; with Name and Address, 2s. per 1,000; Mixture, Pill, &c., equally moderate. An assortment of Labels for all trades. Contracts with large consumers.

J. CROSS, & SON, Engravers, Steam Machine Printers, Lithographers, and Stationers, 18 Holborn hill, E.C. Established 1813.

FUNERALS.

CHEAPSIDE, in gold and silver, in great variety, of every construction and price, from 8 to 60 Guineas. Every Watch skilfully examined, and its correct performance is guaranteed. Free and safe by post.

Money Orders to JOHN BENNETT, Watch Manufactory 65 and 64 Cheapside, and 62 Cornhill, E.C.

Taunton Union.—The Board

of GUARDIANS of this Union are desirous of receiving applications for the appointment of Medical Officer, (duly qualified), for the West Monkton District, comprising the parishes of Cheddon, Fitzpaine, Creech, St. Michael, Durston, and Monkton West.

Area, 7,222 acres, Population, 2,835; Salary, £75 per annum.

In addition to the salary, the officer will be entitled to the Fees specified in the order of the Poor-Law Commissioners of 24th July, 1847. He will be appointed under the Act for Vaccination, with a fee of 1s. 6d. or 2s. 6d. for every successful operation by him, according to distance, and 2s. 6d. per case for each quarterly visit to lunatic paupers resident in the district.

Information as to the duties, &c., may be known on application to me.

Testimonials of qualification, &c., to be left at my office on or before the 15th August next, and personal attendance at the Taunton Union Workhouse at Noon on the following day (Saturday, the 16th), when the election will be proceeded with, if indispensable.

JOHN CHORLEY, Clerk.

July 19th, 1862, Registry place, Taunton.

DINNEFORD'S

Pure Fluid Magnesia,

now perfect in purity and strength.

"Mr Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—'Pharmaceutical Journal,' May, 1846.

This excellent remedy, in addition to its extensive sale amongst the public, is now also very largely used for DISPENSING. In the stone jars (half-gallon, 5s. 6d.; gallon, 9s. 6d.,) specially adapted for the use of Medical Men and Chemists. To be had from the Manufacturers.

DINNEFORD and CO., Chemists, 172 Bond street, London; all Wholesale Druggists and Patent Medicine House.

King's Effervescent Citrate

of MAGNESIA is the original Preparation for which the Proprietor received a Medal at the Great Exhibition in 1851, and has had the sanction and recommendation of the most eminent Physicians in London, and throughout the empire, for the last fifteen years, as a most agreeable and efficacious Saline aperient and Febrifuge, suitable for all ages and all climates. Testimonials accompany each bottle. Sold by all Chemists.—W. W. KING Sole Proprietor, 15 Percy street, W.

Chlorodyne.—R. Freeman,

Pharmaceutist, Kennington road, London, S., informs the Profession and Trade that he has FOR YEARS MADE, and extensively supplied Chlorodyne—in one-ounce and four-ounces stoppered bottles, at 1s. 6d. and 5s. each. He guarantees it to be uniformly and properly prepared, and superior to any other makers', though their charge be ever so exorbitant; and he is glad to find that the low price at which he sells it allows the Profession to use it in common practice and at public institutions, so that its extraordinary beneficial effects are enjoyed by the poorest sufferers. Sold by all Wholesale Druggists.

TO THE MEDICAL PROFESSION.

Charcoal Biscuits, manu-

factured from the purest Vegetable Carbon. Sold only in tins, at 1s., 2s., 4s., and 8s. each, by J. L. BRAOG, Sole Manufacturer, 2 Wigmore street, Cavendish square, London.

Chemists and others allowed a liberal discount.

Post-office Orders made payable at the Old Cavendish street Branch.

Life for the Consumptive.

One Tablespoonful of the PATENT OZONIZED COD LIVER OIL, three times a day, conveys artificially to the Lungs of the Consumptive and Delicate, the vital properties of Oxygen, without the effort of inhalation, and has the wonderful effect of reducing the pulse while it strengthens the system. The highest Medical authorities pronounce it the nearest approach to a specific for Consumption yet discovered—in fact, it will restore to health when all other remedies fail. See 'Lancet,' March 9, 1861.

Sold by all Chemists, in 2s. 6d., 4s. 9d. and 9s. Bottles. Wholesale by G. BORWICK, Sole Licensee, 21 Little Moorfields London.

Struve's Seltzer, Fachingen,

Vichy, Marienbad, and other Mineral WATERS.—ROYAL GERMAN SPA, Brighton, under Her Majesty's especial patronage. The Pump-room is now open for the Thirty-eighth Season. The Bottled Waters are sold at the Pump-room, and by GEORGE WAUGH and Co., Pharmaceutical Chemists to the Queen, 177 Regent street, London, W., and by other respectable houses in London and the provincial towns, where a prospectus with the highest Medical Testimonials may be obtained gratis. Caution.—Owing to the use of Struve's bottles by other parties, please to observe that Struve's name is on the label and red-ink stamp affixed to every bottle of Struve's manufacture.

HOSPITAL SAINTE EUGENIE.

(MR. BOUCHUT'S CLINICAL CONFERENCES.)

Pleuritic Effusion in the Left Side.—Infantile Icterus.—Fresh Cases Illustrative of the Efficacy of Veratria in Articular Rheumatism.

Pleurisy is a disease not uncommonly met with in childhood, and amongst the signs of the effusion, we must note the absence of the vocal fremitus, or thrill, on application of the hand to the walls of the chest on the affected side. This sign, which several authors have pointed out, has on many occasions been observed by Mr. Bouchut, and derives additional value from the fact that, in pneumonia, the vibration of the thoracic parietes is considerably increased. Thus, in a case of acute pleurisy with effusion, in a little girl aged twelve, pneumonia was supposed to exist before her admission into hospital, and by mere palpation of the chest the true nature of the disease was discovered.

Other symptoms, characteristic of effusion in the pleura, were also present—such as unfrequent, dry cough, dulness on percussion, ægophony, bronchial respiration, displacement of the heart (the disease occupying the left side). The morbid secretion filled the lower part of the pleuritic cavity, and rose as high as the spine of the scapula. Mr. Bouchut opined that under these circumstances, aggravated by displacement of the heart, which might possibly occasion sudden death, thoracentesis would, perhaps, be the safest plan of treatment, and the best calculated to give speedy relief. Mr. Bouchut, especially in pleuritic effusion occupying the left side, guides himself, with respect to the expediency of the operation, entirely on the local changes, irrespectively of the general symptoms. The danger to life, in cases of this kind, cannot be measured by the amount of the dyspnœa. Instances are on record of pleurisy unattended by oppression, in which sudden death occurred consequent on copious effusion in the left side of the chest, although the patients were enabled to go about, and seemed pretty nearly in their usual state of health.

Before tapping the chest, however, the Professor determined on trying the effects of other remedial measures, and the issue of the case showed the propriety of this conduct. The disease was yet in its acute stage, the pulse 120; four leeches were applied to the posterior region of the left side of the thorax; the leech-bites were allowed to bleed for an hour, and were then touched with sesquichloride of iron, a powerful hæmostatic, which should be always at hand when children are leeched. Mr. Bouchut at the same time prescribed the following mixture, to be taken in the course of the day:

℞ Aq. lactucæ, ℥jss.;
Syrupi, ℥iv.;
Tinct. digitalis, ℿvj.

A blister was also resorted to, and, as usual, this counter-irritant induced at first a slight increase of the effusion, but this was mere sympathetic irritation, and was soon followed by improvement. The level of the effusion gradually descended, and in less than a fortnight a complete cure was effected without any necessity for thoracentesis.

— In the same ward, we also noticed a little girl, aged two years, afflicted with icterus. The jaundice was not merely a functional disease. Nervous icterus is very unusual in childhood; at this early period of life, fear may induce diarrhœa, chorea, epilepsy, but not jaundice. The disorder was symptomatic. On the 24th of May, after epileptiform convulsions, feverishness, and greenish diarrhœa had set in, and no yellowish discolouration of the skin existed when the child was admitted into hospital, but it appeared twenty-four hours after. On the 7th of June, its presence was distinctly ascertained; it increased on the following day, and the urine, tested with nitric acid, yielded a green precipitate, which became brown after a short time. The abdomen was tumid, and the hepatic region tender on pressure, the liver exceeding the margin of the ribs by about an inch. To these signs were superadded loss of appetite, heat of skin, and frequency of the pulse (110). In this instance, as it is commonly the case in children, convulsions had ushered in acute inflammation, which, originating in the intestine, extended to the liver, and inducing turgescence of the mucous lining of the choledochus, occasioned obstruction of that passage.

The secondary hepatitis being mild, required but little active treatment; feculent beverages and baths were prescribed; half a drachm of trisnitrate of bismuth was daily exhibited for the enteritis. On the 11th of June, the motions acquired greater consistency, the inflammatory action began to subside, and the yellow colour of the integument to fade. The child is at present in a convalescent state.

The green motions observed in this form of disease have been erroneously attributed by Billard to an alteration of the bile in the liver. Green diarrhœa is a symptom of enteritis; the bile acquires a green colour from its contact in the intestines with acid secretions, a phenomenon parallel to that observable in the test-glass, when nitric acid is dropped into a liquid containing the same substance. Thus, when a child at the breast passes water and fecal matter at the same time, after a short exposure to air, the motions become green, a change not referable to any morbid condition, but to the acidity of the urine with which the excrement has been in contact.

This case suggested to the Professor some remarks on the subject of the icterus of new-born infants. In his opinion, this phenomenon, which is so frequent as to be almost a physiological occurrence when it does not exceed certain limits, is also symptomatic of hepatitis consequent on umbilical phlebitis produced by ligature of the cord. Now, this phlebitis may vary considerably in intensity; in private practice it is usually of the mildest character, and often escapes undetected. In the hospitals, on the contrary, its consequences are occasionally serious, and it may give rise to small abscesses in the liver, and even, as Mr. Martin, of Lyons, has remarked, in distant and various organs, such as the scrotum, muscles, &c.

The benign jaundice, observable in about one infant in every three, requires no medical interference. Perhaps, in some few cases, simple or aromatic baths, of half an hour's duration, may be found incidentally useful, and also spirituous embrocations, and the application of flannel to the abdomen; but the more aggravated forms of icterus prove generally fatal in a few days, and very little can be done to save the child. In these fortunately unfrequent cases, protracted immersion in tepid water, oil-enemas, aperients, cold water, and blisters, are the chief resources of the practitioner.

— The exhibition of veratria in rheumatic fever is now no novelty; but, so great and special is its efficacy in the treatment of the disease in infancy, that too much stress can hardly be laid on the utility of this medicinal agent.

A little girl, aged twelve, was admitted on the 3rd of June into St. Margaret's ward, for acute rheumatic fever, the pains chiefly occupying the feet, knees, and hips. The feet were swelled, and presented a characteristic roseate hue. On auscultation of the heart, systolic souffle was detected; the pulse was irregular, intermitting, and frequent (120); the rheumatic affection involved, therefore, at the same time, the serous and the muscular structures of the heart.

Mr. Bouchut resorted in this instance to the exhibition of veratria.

This medicine may be administered alone, but is more readily accepted by the stomach when guarded by opium. The following is Mr. Bouchut's favourite formula:

℞ Veratriæ, Ext. opii. } ā gr. j.

Divide into ten pills, silvered over, and containing each one-tenth of a grain of the medicinal agent. One of these pills is exhibited, night and morning, on the first day, and the dose is increased every day by one pill, unless colics or vomiting supervene. The colics may in general be prevented

by emollient enemas; but, should any untoward accidents occur notwithstanding this precaution, the medicine should be provisionally discontinued, or the dose for a few days decreased.

The first effect of the medicine is to abate the quickness of the pulse, and, as an arterial sedative, veratria is certainly superior to digitalis. In the course of a week, in the case above referred to, the pulse fell from 120 to 60, 56, and 52. The pain at the same time subsided, and the swelling and redness disappeared. These results were effected in less than a week, and merely by the exhibition of twenty pills, or two grains of veratria.

So satisfactory a result is assuredly remarkable; and, as this is at least the thirtieth illustration of the efficacy of this remedy, which Mr. Bouchut has met with in his practice, we point it out as especially deserving of notice. Sulphate of quinine may be as efficacious as veratria in the treatment of rheumatic fever; but the latter drug is more inexpensive and less liable to induce complications—a consideration of some moment. Sulphate of quinine has a tendency to induce cerebral metastasis; but, were it only open to the objection of causing deafness, and, perhaps, amaurosis, this would be amply sufficient to justify a preference for veratria—a medicine easy of management, of insignificant pecuniary value, and any unfavourable action of which can be readily checked or averted.

Art. 6261.

HOSPITAL SAINTE EUGENIE.

(MR. BOUCHUT'S WARDS.—LECTURE DELIVERED BY MR. RICORD.)

Hereditary Transmission of Tertiary Syphilis.—Remarks suggested by a case of Diseased Palate of doubtful origin.

At Mr. Bouchut's request, Mr. Ricord examined one of his patients; the following is her history:

She is aged fourteen, and was admitted into hospital about three months since, for a disease of the mouth of recent origin. Her parents died eight years ago. She has one sister, aged nineteen, who enjoys perfect health. She is intelligent, and declares that she has never followed any medical treatment whatever. Her frame is small but wiry; the integument is perfectly free from any trace of scrofulous disease, or scars, denoting previous eruptions of ecthyma or rupia. The most minute investigation fails to detect any morbid appearances about her person, beyond a few small and indurated glands in the sub-maxillary region. There is neither running at the nose nor any symptom of ozena, and it is, to say the least, extremely improbable that she has ever been exposed to the contagion of glanders or farcy.

The first and most striking circumstance observable is the nasal resonance of the voice, which indicates some defect of the palate. On inspection of the cavity of the mouth, its condition is found to be as follows: The soft palate is destroyed, and also a portion of the osseous vault, which is divided by a longitudinal slit, situated a little to the left of the mesial line; the margins of the cleft are irregular, and covered with pale, roseate granulations, disseminated over an unhealthy-looking surface, presenting altogether some resemblance to a cancroid sore. The incisors are loose, and the incisor bone is also moveable, and affected with necrosis. But the disease does not extend beyond the eye-teeth, which distinctly form its outward limits.

Mr. Bouchut, conceiving the case to be of scrofulous origin, prescribed arseniate of soda, and tar-water injections, four times a day; the arseniate of soda was exhibited in $\frac{1}{17}$ gr. doses, four times in the twenty-four hours. This method stimulated the digestive powers, and, in some respects, the child seemed to improve. The amelioration, however, was but slow, and, as the diagnosis presented some obscurity, Mr. Bouchut felt desirous of obtaining Professor Ricord's opinion. This gentleman, therefore, examined the patient with the utmost care, and delivered in the theatre of the hospital a highly interesting lecture on the subject.

Mr. Ricord, after a minute description of the anatomical changes observable, invited attention to a satisfactory circumstance—viz., the circumscribed limits of the mischief, which induced a hope that the naso-palatine osteitis might make no further progress. This form of disease of the bone is extremely common in the adult, in whom, in the vast majority of cases, it points to syphilis. It is less frequent and of more obscure origin in childhood.

Let us, however, said Mr. Ricord, for the sake of argument, admit that, in the present instance, the symptoms are due to a syphilitic taint; in that case, here, as in the adult, they must belong to the class of tertiary manifestations. We will now inquire if this hypothesis presents any degree of probability. In the first place, the age of the patient cannot be alleged as a sufficient reason to set aside the idea of contamination. Mr. Ricord is acquainted with an instance in which an infant at the breast was thus infected by sexual contact with its nurse; the records of the tribunals abound in similar instances. But tertiaries do not immediately follow the primary sore. Between the two, a connecting-link exists, in the shape of secondary symptoms. Now, neither in the recollections of the patient—not altogether to be depended upon, it is true—nor in the inspection of her person, do we find the slightest evidence of any secondary eruptions. This does not, however, authorise us entirely to reject the idea of tertiary syphilis. It is not absolutely indispensable, in order to assert the existence of tertiary disease, to observe the traces of secondary symptoms. Unless these have previously broken out in the shape of ecthyma or rupia, they do not leave any recognisable scars on the integument. The eruption, moreover, may have been situated on the mucous and not on the cutaneous surface. But we may go further, said Mr. Ricord; conceding that in this case no secondary, intermediate manifestations ever took place; that no mercury was ever exhibited, we are not yet in a position to declare that the affection of the mouth is not due to tertiary syphilis; because the hereditary taint may be handed down to a child and assume at its first appearance tertiary characters, many years after birth.

In order to impress the foregoing remarks more fully on his hearers, Mr. Ricord alluded to the length of the interval which elapses in general, between the primary and constitutional symptoms of syphilitic disease.

When no mercury has been exhibited, six months seldom elapse without some outward sign of the poison becoming manifest. In general, secondaries appear within three months after contagion; they consist in a sense of general lassitude, neuralgic or rheumatic pains, enlargement of the lymphatics of the neck, falling off of the hair, and superficial eruptions on the skin and mucous membranes accessible to the eye (*a*). These symptoms open the scene. Tertiary manifestations do not break out a few weeks only after the primary ulcer; tubercular indurations, nodi, exostosis, deep-seated affections of the osseous, fibrous, or muscular structures, expressive of protracted fermentation of the poison lurking in the system, are seldom observable before an interval of six months, and under the agency of a host of circumstances which hasten or retard its evolution, tertiary syphilis makes its appearance more or less tardily. Mr. Ricord adduced in illustration the case of a man who contracted a chancre on the occasion of the coronation of the Emperor Napoleon I. in 1804, enjoyed perfect immunity for forty years, and in 1844 presented a tertiary abscess in the cheek, which promptly yielded to the exhibition of iodide of potassium. Professor Sigmund, of Vienna, relates a case in which the soft palate was destroyed by tertiary syphilis nineteen years after a chancre, and brings forward instances of disease of the periosteum, bones, and cartilages, after an incubation of forty-one years. Osteitis and affections of the fibrous and cartilaginous textures are among the latest manifestations of syphilis.

The laws which govern the evolutions of the syphilitic diathesis in the adult, are entirely applicable to children tainted before their birth. The infant may be born to all ap-

(*a*) Dr. MacCarthy, in his inaugural thesis *On the Diagnosis and Succession of Syphilitic Symptoms*, mentions seven weeks as the average interval between the appearance of infecting chancre and the eruption of roseola, the earliest of *syphilidæ*. Mr. Fournier (*Lectures on Chancre*) shows that this estimation agrees with that of Bassereau (from the 30th to the 60th day); of Professor Sigmund, of Vienna (six weeks in general); of Mr. Fournier (from the 40th to the 50th day); and of Mr. Diday (habitually 46th day).—THE EDITOR.

pearance healthy, but six weeks afterwards secondary symptoms break out—an untoward circumstance, which too often has led to litigation between the parents and nurses.

These laws, however, may be modified or suspended in their operation by the influence of mercurial treatment, which retards the morbid manifestations, disturbs the regularity of their succession, and may in hereditary syphilis altogether suppress the secondary connecting link, and cause the disease to make its first appearance in the tertiary form. According to Mr. Ricord, the child is in the same situation as its parents; if in the latter, mercury has checked the secondaries, ten, fifteen, twenty years may elapse with perfect immunity from any tertiary symptoms. The remark equally applies to the child who, now a branch detached from the tree, was originally nurtured on the same sap, and has derived from it similar tendencies. The treatment which cured secondaries in the parents likewise preserves the infant, but parents and infant remain liable, at a more or less distant period, to tertiary manifestations. This explanation satisfactorily accounts for certain tumours of obscure nature, which give rise to frequent errors of diagnosis, because, as nothing points distinctly to the concatenation of the symptoms, the Surgeon is reluctant to admit the existence of a syphilitic taint not clinically demonstrable, but indicated by the results of treatment.

Facts of this kind, whatever their interpretation, frequently recur in practice. Mr. Ricord adduced, in illustration, the case of a lad, aged seventeen, who presented symptoms closely resembling those existing in Mr. Bouchut's patient. He had never been affected with primary or secondary disease; but his mother suffered before her marriage from a severe syphilitic eruption, the traces of which were still visible; the mercury had succeeded in arresting its progress, but syphilis, though checked in the parent, had induced tertiary symptoms in the son.

Instances of this description are, as we have said, common, and often cause much perplexity to the Surgeon. In conclusion, in the patient who is the object of the present remarks, tertiary syphilis transmitted hereditarily is admissible.

Now, is it possible to assert that the case is not one of scrofula? Mr. Bouchut was inclined to believe that the symptoms were merely due to a scrofulous habit, and, doubtless, in its later periods syphilis is closely akin to scrofula. Indeed, Lugol was of opinion that it might positively originate in syphilis, and Mr. Ricord admits that both taints may be associated; in which case, it is important to discover which is the predominating element. In Mr. Bouchut's patient, Mr. Ricord does not consider that it is scrofula. With the exception of some insignificant glandular swellings of the neck, which may depend on the condition of the mouth, no signs of genuine scrofula are here observable.

But admitting the solitary existence of one or the other disease, no bad result can follow a diagnosis in either sense, because the same treatment is applicable to both. The precision of the diagnosis can here be of importance to prognosis only. Of the two affections, syphilis is not the most serious, and former experiments on the efficacy of iodide of potassium, have established beyond contradiction the fact, that wherever syphilis and scrofula are combined, a cure is effected with a degree of speed, and certainty proportionate to the predominance of the former over the latter element.

In the present case, Mr. Ricord recommended the adoption of the following measures of treatment:—

Locally, the incisors are loose, osteitis with suppuration, caries and necrosis are present: the incisor bone has become a foreign body, and keeps up the local irritation. Caries generates caries, mortification has a tendency to spread. It is expedient, therefore, to extract the teeth, and watch the detachment of the sequestrum, which should be removed at the earliest opportunity. After this, or even now, the diseased parts should be touched with diluted tincture of iodine, and the following lotion and gargle may be used with advantage:

℞ Tinct. iodini, gr. xv.—xxx.;
Potassii iodidi, gr. v.;
Aquæ destill, ℥vij. M.

Internally, it will be proper to exhibit cod-liver oil, bitters, iodide of iron, and generous food; the child should have healthy exercise in the open air. Under similar circumstances, the waters of Forges, and the Salins brine-baths, are highly beneficial.

In addition to this treatment, more especially appropriate to scrofula, iodide of potassium, the most efficient of all remedies in tertiary syphilis, should also be resorted to. Mr. Ricord generally administers this drug morning and evening with the cod-liver oil, and the syrup of iodide of iron can be taken in the intervals. The effects of the iodide of potassium require close watching. Eight grains only should be prescribed at first, and if no counter-indication arises, the dose may be increased to fifteen, twenty-five, forty grains, and even to a drachm or a drachm and a half daily.

This plan of treatment will doubtless be instituted in the present case, and we shall take an opportunity of recording its results.

Art. 6262.

HOSPITAL LARIBOISIERE.

(MR. CHASSAIGNAC'S WARDS.)

The Plaster Bandage in Fractures.

The introduction of anæsthetics into surgical practice has very materially modified the question of the reduction of fractures. As the surgeon can now suspend at will muscular contractility, which constitutes the principal resistance to his attempts, he may dispense with the numerous assistants hitherto employed, and disregard as unimportant the more or less complicated contrivances, recommended for the purpose of effecting extension and counter-extension.

The first and grand objects of treatment consist in restoring as promptly as possible the fragments to their natural position, in securing their natural coaptation, and obviating their undue mobility. As Mr. Chassaignac truly and frequently remarks, *the best antiphlogistic remedy, and the most efficacious antispasmodic after fractures, is the immediate reduction and subsequent immobility of the injured limb.*

We have stated that, with the assistance of anæsthetics, reduction—at least momentary,—can always be obtained. The duty of the surgeon is then to take immediate measures to secure the permanency of the coaptation. Plaster is the agent best calculated to answer this purpose, and Mr. Chassiagnac has recourse to it in many embarrassing cases, without, however, rejecting the other systems of bandaging which circumstances may call for.

In certain fractures, the Professor applies at once all those accessory parts of the dressing which may be adjusted beforehand, such as a boot, a gauntlet, a pelvis frame, &c. When these preliminary appliances have been established, and have acquired a degree of solidity which admits of the necessary tractive efforts, reduction is effected, and the apparatus, which promptly becomes solid, is completed. In a case of oblique fracture of the thigh, for instance, the Professor begins by enveloping the leg in a plastered bandage, which extends beyond the knee; the pelvis is likewise accurately surrounded with a similar covering, which, of course, does not include the natural orifices; and when these accessory portions, into which a sufficient number of loops or strings have been incorporated, are perfectly hardened, chloroform is exhibited, and, with a few tractions on the loops, the fragments are replaced in their natural position, and without loss of time confined in the prepared bandages, which promptly dry and become solid, the parts being thus maintained in the most perfect coaptation.

For a long time, Mr. Chassaignac experienced considerable difficulty in the arrangement of the dressing around the pelvis; indeed, when the subject reclines on his back, it is all but impossible to apply correctly the plastered roller around this part of the body, the weight of which deforms the fabric before it has had time to harden. Mr. Chassaignac now proceeds as follows: after applying the boot as far as the upper part of the thigh, if the neck of the bone is fractured, and allowing this part of the dressing to dry, he causes the patient to be supported by assistants in the standing attitude, and lays

over a common roller, previously applied around the pelvis, the plastered bandage, which in a few minutes becomes hard; the patient is then replaced in the horizontal attitude, reduction is proceeded with as we have stated, and the surgeon finds no difficulty in adjusting the remaining parts of the apparatus.

Mr. Chassaignac has treated in this manner with great success many injuries of the limbs, and several of the subjects have been exhibited before the Society of Surgery, when the shortening was found not to exceed eight or ten lines, and the almost entire absence of lameness caused much approbation.

This system is applicable in many recent fractures. At the meeting of July 11th, 1860, Mr. Chassaignac presented to the same scientific association a case, in which perfect coaptation and consolidation of the fractured patella had been effected, despite considerable separation between the fragments, by means of the inclined plane, and a plaster bandage, laid over a shell of diachylon, previously applied round the knee.

When this system, recommended by Messrs. Mathissen and Van de Loo, is adopted, a common roller, or some contrivance calculated to protect the integument from contact with the hard dressing, should always previously be applied. A great merit of the plaster-bandage is the facility with which it can be prepared. The common dry plaster used for moulding should be pressed in with the hand, on a table or in a basin, into both sides of a common linen, cotton, or flannel roller, about 15 or 18 lines in width; the band is then rolled up and applied as usual, an assistant at the same time moistening the surface with a wet sponge during the progress of the operation. The coils of the band should be imbricated, and each should cover three-fourths of the circle above it. A second and a third roller should thus be applied, and wet plaster laid over all to secure desirable solidity.

In order to fenestrate the apparatus when necessary, Mr. Chassaignac uses, besides Scutin's shears and the usual excision forceps, a thick rasp, with which any part may rapidly be thinned off, or moveable valves may be opened with shears, at the will of the surgeon. The dressing can easily be removed, by moistening its surface to prevent the dust from rising.

Lecture by a Deaf-Mute.—On Wednesday, the 2nd ult., an interesting lecture was delivered by Mr. Ernest Griolet, a deaf-mute, at the Polytechnic Institution. The subject was "The Mountain of Bella Iola in Switzerland," and his own personal adventures.

Appointments. — William Ebenezer Bletchly, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Almondbury District of the Thornbury Union, Gloucestershire, *vice* Charles Powell, M.R.C.S. Eng., L.S.A. Lond., deceased.—John Bubb, L.S.A. Lond., has been appointed Assistant-Surgeon (a newly-created office), to the Cheltenham and Gloucestershire Ophthalmic Infirmary.—Anthony William Close, F.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer and Public Vaccinator for the Ashton-on-Mersey District of the Altrincham Union, Cheshire, *vice* Jeremiah Renshaw, L.R.C.P. Edin. (exam.), M.R.C.S. Eng., L.S.A. Lond. deceased.—Joseph Thomas Forbes Firth, L.S.A. Lond., has been appointed Medical Officer and Public Vaccinator for the East District, Rotherhithe Union, Surrey.—Henry Goode, M.B. and Lic. Med. Cantab., M.R.C.S. Eng., L.S.A. Lond., has been elected President for 1863 of the Midland Branch of the Bristol Medical Association.—Joseph Mortimer Granville, L.R.C.P. Lond. (exam), M.R.C.S. Eng., has been elected Medical Officer for the Union Workhouse, Bristol, *vice* Emilius Scipio Mayor, M.R.C.S. Eng., L.S.A. Lond. resigned.—Mr. H. Stanley Gull, M.R.C.S. Eng. L.S.A. Lond., has been elected Assistant-Surgeon to the Stockport Infirmary.—Jonathan Hutchinson, M.R.C.S. Eng., L.S.A. Lond., has been elected Assistant-Surgeon to the Royal London Ophthalmic Hospital, Blomfield street, Moorfields.—George Lawson, F.R.C S. Eng., L.M. L.S.A. Lond., has been elected Assistant-Surgeon to the Royal London Ophthalmic Hospital.—Mr. Arthur Treberne Norton has been appointed Demonstrator of Anatomy at St. Mary's Hospital Medical School, *vice* George Green Gascoyen, F.R.C.S. Eng. exam.), resigned.—Charles Albany Wade, M.R.C.S. Eng., has been elected Surgeon to the Royal Kent Dispensary (for the District of Greenwich), *vice* Henry Rowland Palmer, M.R.C. S. Eng., resigned. —John Whipple, M.R.C.S. Eng., L.S.A. Lond., is President for 1862-3 of the Western Branch of the British Medical Association, in succession to Charles Barham, M.D. Cantab.—Lauriston Winterbotham, M.R.C.S. Eng., and L.M., L.S.A. Lond., has been appointed Surgeon to the Cheltenham Dispensary for Diseases of Women and Children, *vice* Walter Jessop, M.R.C.S., Eng., deceased.

THIRTIETH ANNUAL MEETING
OF THE
BRITISH MEDICAL ASSOCIATION.

The Meetings of the British Medical Association have been held during the week at the Royal College of Physicians, which body courteously resigned their rooms to the use of the Association The attendance was not equal to expectation, a much smaller number of provincial members having arrived than the peculiar circumstances of the year had led the Committee to anticipate. The London members attended in good numbers, especially at the opening meeting at the College of Physicians and the Conversazione given by the College of Surgeons, and on the whole the reunion has been animated and agreeable. The Journal is the drop of bitter in the Association's intoxicating cup of enjoyment. Congratulations on the success of the Association were timidly uttered, for in every mind, whenever a compliment was attempted—"surgit amari aliquid"—the Journal. The members who attended were between three and four hundred in number.

First Day—Tuesday, August 5.

The meeting commenced at 3 o'clock p.m., with an address from Dr. Lochée, the retiring President, who resigned the Chair to Dr. Burrows, the President of the year.

Dr. Burrows, on taking possession of the Chair, said that he was deeply sensible of his responsibilities. He congratulated them that, by the liberality and courtesy of the President and Fellows of the College of Physicians, they were assembled within the walls of this time-honoured institution. Without the co-operation of the Committee of the Metropolitan Branch, the honorary secretaries, and Dr. Stewart, it would have been entirely beyond his powers to have attempted the performance of the anxious duties of President. (Hear, hear.) In the name of the metropolitan members, he cordially welcomed their provincial brethren. (Hear, hear.) He then referred to the advantages of unity and to the elevating influences of the International Exhibition. adding:—If such benefits as these may arise from the intercourse of foreigners with each other, may we not fairly assume that the scattered members of a common profession, although usually kept apart by great distances of residence, and by the imperious calls of duty, may derive great moral improvement by being brought from time to time from their homes to a common centre of attraction, and that centre being the anniversary meeting of this the British Medical Association. Let us consider what are the chief objects of our Association. This Society has now existed exactly thirty years, and was founded, as you well know, by our much-respected friend Sir Charles Hastings. (Hear and applause.) By its original constitution, its operation and influence were confined to the provinces, and the two main objects to which the efforts of the Association were directed were the promotion and diffusion of medical science; and, secondly, the maintenance of the honour and interests of the medical profession. After a course of twenty years of great success and popularity, the Provincial Medical Association determined upon extending the area of its labours, and metropolitan practitioners were invited to unite with their country brethren. When this union was happily effected, the Association naturally assumed a title more expressive of its extended field of action, and it became the British Medical Association. This Society, both before and since the assumption of its present designation, has been a strictly catholic medical institution, embracing all grades in the profession, liberal in its constitution, and free from all class or corporate prejudices, so that every legally-qualified medical practitioner can become a member of this Association if he so desire. Such, then, are the objects and principles of our body briefly enunciated. Let us now inquire how far this Association is acting in accordance with its avowed principles, and whether it really tends to the promotion of medical science and the diffusion of medical information amongst the members. For a long series of years this Association published volumes of "Transactions," in which are to be found numerous original papers of peculiar interest, contributed principally by the members resident in the country, and which contain the observations and the local experience of provincial practitioners of great eminence. The *Journal* of the Association—the recognised organ for the diffusion of intelligence, for reporting the proceedings of our various branches, and for the reception of lectures, essays, and other contributions of more ephemeral interest, and which was formerly a provincial journal, has long since become a metropolitan publication. The annual meetings have stimulated researches of great value, the results of which have been made known to and discussed by our members, whilst most elaborate and carefully-prepared reports upon special subjects of Medicine and Surgery have from time to time

been presented to the Association, and subsequently published in various forms. After a few more remarks on this subject, Dr. Burrows passed on to the consideration of the second object of the Association. The British Medical Association has been, he observed, a most powerful instrument to promote and protect the social interests and to elevate the moral tone of the profession. It was founded in no narrow or sectarian spirit. Never was an institution free from class prejudices, and yet nobly exercising a moral control over its members, more required in our profession than at the present time, when "Men run to and fro and knowledge is increased." He would assert that an institution founded upon the principles of the British Medical Association is urgently required in the present day. It will be admitted as a truth by all reflecting persons that institutions which are advantageous and suitable to society in one stage of civilisation are not so in another. When society progresses and civilisation has advanced, primitive institutions require to be remodelled, or they fail in exercising their former wonted beneficial influence. In the infancy of trade certain laws may be essential to their growth and prosperity; whereas when trade has developed itself, has become firmly established and has arrived at maturity, the very same laws may act as shackles to the industry and enterprise of those who are engaged in such pursuits. Thus in the infancy of England's commerce we find kings and statesmen encouraging adventurers and merchants to make voyages to distant regions and open new fields for our trade, and offering premiums to such enterprises by granting monopolies. These monopolies were originally granted not only as marks of royal favour for supposed services, but were considered as essential to the development and well-being of commerce; whereas now, the very term "monopoly" has become odious, and such a restriction is deemed hurtful to the true interests of commerce. In like manner particular trades and callings were placed under the protection and regulation of certain bodies termed guilds or companies, and no man could follow his trade or calling unless he served his apprenticeship or became subject to his guild or company. We know what extensive powers and exclusive privileges were accorded to these corporations, and what political influence they formerly possessed. At length, however, a period arrived in our history when the stripling trade of the country had made such gigantic strides that it could no longer be compressed and controlled within the limits and narrow rules of these ancient corporations. In no country of the civilised world have we seen a more firm adherence to that which is sound in principle, and at the same time a more gradual and happy moulding of forms and institutions to the advancing knowledge and wants of the community than in our own. In the earliest epoch of our own Profession, when it was developing itself into its present forms, we find certain colleges or corporations were founded, and to them were assigned the government, improvement, and protection of the respective orders in the Profession. We could hardly recognise ourselves as a distinct profession, dissociated from the priesthood in one direction, and from the barbers and grocers in another direction, prior to the granting of the Charter to the Royal College of Physicians by King Henry VIII. That Charter was most liberal in its principle and comprehensive in its scope. To a certain number of learned men was granted, as the Charter runs, "all that was necessary for the good government of all men pursuing physic in all its branches." But shortly subsequent to, and for some generations after, the grant of this Charter came the day of religious intolerance and political exclusiveness; and a Charter which was originally framed for the good of all men of the faculty of physic, was perverted to political purposes, and to promote the selfish ends of a small section of the commonalty of physic. Let us not judge too harshly the conduct of by-gone generations, nor of those who have preceded us upon the stage of professional life. We may not approve the course they may have adopted at some critical period; but we all know that when events have passed, and produced their natural consequences, it is easy for those who come after to sit in judgment, and pronounce which would have been the wiser course to have adopted in a particular juncture. Whatever narrow or exclusive policy the College of Physicians may have pursued in earlier times, it must be confessed by all who take the trouble of studying its annals that the College has always upheld the learning and moral tone of its Fellows, and thereby sustained and elevated the social position of the whole Profession in England. (Applause.) Although the College of Physicians has recently modified its constitution, with the desire to satisfy a want, and to render the institution more useful to the mass of the practitioners in medicine, still it must be borne in mind that the Medical Act of 1815 has placed this College in a very different position from that which it occupied for three centuries previously. During that long period the College enjoyed almost a monopoly in the creation of physicians in England, and it was armed with stringent legal powers to enforce obedience to its regulations. Now this College no longer possesses that monopoly; but it performs its functions conjointly and on equal terms with the Colleges of Physicians of Ireland, and of Scotland, and the ten Universities of the United Kingdom, while the exercise of its legal authority has fallen into disuse. Hence, then, this College of Physicians has no longer power to regulate and control the practising physicians throughout England and Wales. The second public Medical corporation is the Royal College of Surgeons, and this is comparatively a modern institution, one of rapid growth and great power. It is only during the past century that we can recognise it as a separate body, and only through a more recent period that it has exercised such an extended influence over the character and position of a large portion of our Profession. The fame of John Hunter, based on his original and profound researches throughout animated nature—the custody of the great national treasure, the museum of that eminent man—the constellation of surgical talent which arose after Hunter's death, and which was composed of his pupils and immediate successors, Cline, Astley Cooper, Abernethy, Brodie, Travers, Lawrence, and others—the augmentation and illustration of the Hunterian Museum by the labours, talents, and eloquence of Professor Owen—all these circumstances conspired to place the College of Surgeons in a proud and commanding position, and have tended to raise British surgery to a high point of estimation both at home and abroad. But, granting to the College of Surgeons all these honourable claims to distinction and scientific reputation, it may be questioned whether the constitution and policy of the governing body of that College have been such as to conciliate the feelings of, and maintain a wholesome moral influence on, the members of the corporation. (Hear, hear.) The recent deplorable disregard which the College of Surgeons has manifested for the regulations of the General Medical Council respecting the best method of conducting the education of students entering the Profession, has again, in my opinion, placed that College in a false position. Should the Council of the College of Surgeons unfortunately persist in the course which it has lately adopted, and maintain its antagonism to the General Medical Council on the all-important question of Medical education, the result must be either that the regulations of the General Medical Council will be set at naught with impunity by the other educational bodies as well as by the Royal College of Surgeons, or this latter body will be ultimately brought into a most lamentable collision with the General Medical Council before her Majesty's Privy Council. The third Medical corporation or company which has had a powerful influence in bringing our Profession to its present condition is the Apothecaries' Society. This ancient body had a new and vivifying principle infused into it by the trusts confided to it by the celebrated Act of the year 1815, and the faithful manner in which that Society has for nearly half a century discharged the duties imposed upon it by that Act of Parliament, has not only redounded greatly to the credit of the Society, but has almost revolutionised the whole Profession throughout England. (Applause.) The Medical Profession as it was in the year 1815 is not to be recognised as it exists in the year 1862. It is but the natural consequence of the successful efforts of that Society in raising the education of its licentiates that a higher tone of feeling should have been created among them, and that many of those gentlemen should be animated with the desire of obtaining an acknowledged professional status different from that which was formerly held by the apothecary in this country. So long as lines of demarcation between the different grades of the Profession in England were sharply defined, and every man legally practising his Profession was more or less closely affiliated to one of these three corporations, the moral government of the Profession, although imperfect, was practicable. But when by the improvement of education throughout the mass of Medical practitioners the distinction between the different orders became less and less, and the lines of demarcation more and more indistinct,—and still further, when by recent legislation a perfect reciprocity of practice was universally established throughout the United Kingdom, numbers of men would necessarily be found practising their profession far beyond the control of their former *alma mater*, still not acknowledging allegiance to any particular Medical corporation. Then, the legal control and moral influence of these Colleges and Societies over the body of practitioners virtually ceased to exist. He could not refrain from the conclusion that both at the present time and for the future these corporations, like those which in olden times were instituted for certain commercial purposes, cannot and will not fulfil an important part of their original functions, and that either some new institution founded upon more comprehensive principles and incorporated by the Legislature, or some voluntary association, formed and based upon no exclusive principles, but embracing members of every grade in the Profession, is wanted to supply this inability in the older institutions to exercise a wholesome moral influence over the whole Medical community. (Hear, hear.) The British Medical Association, both in its principles and its formation, embodies this idea, he thought. The different Medical corporations may still rightly superintend the education and test the qualifications of those entering the three orders of the Profession, but it must be somebody having more general and acknowledged authority than they possess which can exercise a real moral influence over the Profession as a whole. He would, therefore, say in conclusion, *Floreat semper!*

Dr. Williams (the Secretary) then read the annual Report of the

Council, which stated that 130 new members had been enrolled during the past year; and since the last annual meeting there had been 75 resignations, 30 deaths, and 25 erasures, leaving a total number of members on the books of 2,120. The receipts for the year amounted to 2,820*l.* 15s. 9½d., and the expenditure to 2,713*l.* 10s. 7d., leaving a balance of 107*l.* 5s. 5½d. The assets, including 500*l.* unpaid subscriptions, were estimated at 907*l.* 5s. 2½d., and the liabilities at 666*l.* 17s. 2½d., leaving a balance in favour of the Association of 240*l.* 8s.

Sir CHARLES HASTINGS proposed the adoption of the Report, and congratulated the Society on its improving prospects. It was thirty years since a small but earnest band combined together to form the Society. Since that time it had gone on prospering, and he could not conceive now any circumstances more calculated to advance its onward progress than the present auspicious meeting in the Metropolis, under the presidency of Dr. Burrows. (Hear, hear.) There was one point mentioned in the Report to which he desired briefly to allude—namely, the representation of the Profession in Parliament. If the law passed last year with regard to the Universities turned out to work successfully, there was no reason why on some future occasion the claims of the Medical Profession to representation in Parliament should not be favourably received by the Minister of the day. A variety of questions would be brought before the members; they were not, perhaps, of the same intense interest as those which engaged them during the agitation of the Reform question in Parliament, when the labours of the Society were so eminently successful in obtaining the Medical Act. That act, no doubt, might be improved; but the effect had been that Medical men of all classes under the registration had become one body in every part of the British empire. (Hear, hear.)

Dr. WEBSTER seconded the resolution, and congratulated the President on his accession to office, especially as the son of an old friend who had done so much in former times to advance the interests of the Profession. He regarded the British Medical Association as the Parliament of the Profession and the exponent of public opinion.

Mr. WEBBER alluded to a paragraph in the Report urging the members to send contributions to the *Journal*, and complained that when papers were so forwarded and printed, the type was afterwards used for printing them in a separate form. He thought the *Journal* type ought not to be employed for private purposes. He also inquired if the *Journal* had a sub-editor and reporter; and complained that a garbled report of his observations at the Canterbury meeting had found its way into the pages of the Society's organ. The speaker was about to bring forward a motion of which he had given notice with reference to his dispute with Mr. Wells, but, at the suggestion of the President, the consideration of the subject was deferred to a later period of the meeting.

Mr. STEELE complained that in the Report of the Council the subject of Medical legislation had been passed over in silence. It is, we are told, to the Association that we are indebted for the Medical Act, and to this he agreed. Yet it was admitted that there were certain defects which gave rise to much dissatisfaction, and interfered with carrying out the spirit of the Act. He could not, then, understand how it was that the Council had not given the subject further consideration. It would be some satisfaction if the real working of the Medical Act were alluded to. Was it given up as a bad business. If not, why not persevere, and try to get Government to pass an Act to make things more satisfactory? Can we be told if there is any prospect of amendment, or are we to stay as we are,—if the Association intends to make any exertion in the matter? In reference to the arrears of 500*l.*, it was strange that it was precisely the same sum that was owing the previous year. It was not mentioned whether the arrears were the same. He thought that it would appear that arrears of 500*l.*—nearly one quarter of the Society's income—was not a satisfactory state of things, and scarcely creditable. It was but just that each member should not pay his share. The defaulters received the Journal, which was paid for by the subscriptions of the rest, and sometimes they had to put their hands in their pockets to pay the debts of the Society. He did not think them bad debts. The arrears were, in this case, due to the loose and irregular manner in which some medical men conducted their affairs. He thought that the subject having been brought before the general meeting, the Council would be better able to put on the screw. He did not think that by extra pressure a single subscriber would be lost.

The PRESIDENT said that, although not mentioned in the report, the subject of Medical Reform had been considered by the Council, and that a Committee had been appointed to draw up a Bill, which would be in due time laid before the members. He added that it was from no want of application that the arrears of subscription were not got in. They had a stringent rule that if a subscription was in arrear more than twelve months, the Journal should not be sent. It would be illegal, libellous, to publish the names of those who did not pay, as legally there was no claim, it being entirely a question of honour.

Dr. WOOD thought that the non-payment of arrears was owing to procrastination and carelessness, and suggested that a life-payment should be received instead of annual subscriptions.

It was then suggested that a collector should be appointed, who should receive a commission on the amount he got in.

Mr. W. D. HUSBAND, of York, said that if there was a stringent rule that the names of members six months in arrear should be expunged from the lists, it would probably tend to induce greater punctuality in payment.

Votes of thanks were then given to Dr. Lochée, to the Council, and to the Secretary, Dr. Williams.

The PRESIDENT then said that Mr. Webber might now bring forward the motion of which he had given notice. He would, however, first read a resolution of the Council recommending that the dispute alluded to (between Mr. Webber and Mr. Spencer Wells) should be referred to three referees.

Mr. WEBBER said that he should be glad to fall in with any suggestion of the Council, but first he would make some observations. He was sorry to adopt any course contrary to the wishes of the meeting. In regard to appointing one of the Committee, he respectfully declined to do so, and would leave his cause in the hands of any one. He thought that after having been a worker in the Profession for forty-five years, it was hard now to be branded as a criminal libeller and to be visited with ruin. He wished to bring before them the action for libel brought against him by Mr. Spencer Wells. One object of the Association was to look to the honour and respectability of the Profession. Character is always a great thing, and every one is glad to see that people are brought to account for their doings. Had the College of Surgeons in this case done their duty, he (Mr. Webber) would not have been in his present position, and have been brought to ruin. He felt sure that his case would elicit the sympathy of the members. He had never yet had his cause fairly stated, and hence the trial went against him, and the Judge would not stay execution. He would submit to the arbitration on condition that all the evidence be published.

Dr. STEWART said that it would be impossible for the Association to pledge itself that the whole, or indeed any of the evidence, should be published.

Mr. WEBBER then requested that the President would act for him.

The PRESIDENT declined, on the ground that Medical men in London were so closely connected one with another that it would not be well for any one in London to undertake it.

Mr. WEBBER said that he would leave his cause in the hands of the Committee appointed to investigate a Professional dispute at Canterbury.

Mr. SPENCER WELLS said that this case had been brought into a court of justice, and had been tried by a jury before the Lord Chief Justice. He (Mr. Wells) had been examined on oath before the court, and Mr. Webber might have been if he had thought fit. In a court of justice only could he meet Mr. Webber, when, if he spoke falsely, he could be punished for perjury.

Mr. WEBBER said that Mr. Wells knew well enough that he was now driven to poverty, but if he could sue *in forma pauperis* he would gladly meet him in a court of law.

Dr. WEBSTER suggested that a court of honour should be appointed by the Council, to investigate disputes whenever they unfortunately arose.

Mr. WEBBER said that at an early period he offered to submit the question to arbitration, and offered that the disputant in the wrong should buy a life governorship in the Medical Benevolent College, to be exercised by the one in whose favour the question was decided. He was anxious to defer to the wishes of the members, and would at least go before the Committee.

SECOND DAY, WEDNESDAY, AUGUST 6.

Dr. BURROWS, President, in the chair.

A short report from the Council was then read in reference to the dispute between between Mr. Webber and Mr. Wells. They decided not to entertain any question that had already been settled in a court of law, but would hear any further charges of unprofessional conduct that might be brought forward. A resolution to this effect was moved by Mr. W. D. Husband, of York; it was seconded and carried unanimously. The Council were of opinion that the refusal of one of the disputants to submit to the adjudication of the Society ought not to prevent the inquiry from being carried out. A resolution to this effect was also carried.

A paper, by Dr. B. W. RICHARDSON, was then read, entitled,

AN EXPERIMENTAL REPORT ON THE TREATMENT OF SUSPENDED ANIMATION.

Dr. RICHARDSON had conducted more than seven hundred experiments, extending over a period of many years. He wished first to state that he took into his inquiry those cases only in which in the otherwise healthy body, the oxidation of the blood was not accomplished, disregarding those in which there were organic changes from injury, disorganisation of the blood, &c. He would divide the cases into the following:—1st. Those in which the current of air was cut off from the lungs by occlusion of the wind-

pipe, as strangulation, drowning, &c. 2nd. Those in which the inhalation of certain vapours, as chloroform, prevented the oxidation of the blood. 3rd. Those in which poisons absorbed from the alimentary canal prevented the oxidation of the blood, as, for instance, chloroform. 4th. Shocks to the system generally interfering with the oxidation of the blood. 5th. Cases in which the blood is removed from the air, as in hæmorrhage. 6th. Cases of extreme cold. Time would, however, only permit him to dwell on the first two. He should in each describe the morbid appearances after death, and then in conclusion, speak generally of the treatment in cases of suspended animation. In cases of obstruction of the windpipe, the morbid phenomena are generally the same, but not quite alike in different cases. In all cases where death has occurred within eight minutes, the condition of the blood is the same, the corpuscles being normal and the fibrine not separated. In all, however, the process of coagulation, in the body, was very slow. In twenty-three examples the blood had been found fluid in twenty minutes after death. In one case of hanging in the human subject he had found the blood fluid three-qnarters of an hour after death. Yet this was not due to chemical changes, as the blood when exposed to the air coagulates, and is susceptible of oxidation, and is capable of restoring muscular irritability. If the death be very rapid, the right side of the heart will be found gorged with blood, and the left firmly contracted. The Author then showed an instrument by which he was able to regulate at pleasure the amount of air admitted into the windpipe. If, however, death be less sudden, the condition of the heart is different, the left side of the heart also contains some blood, and is somewhat relaxed. If, during death, the stethoscope be applied over the region of the heart, the heart's sounds will be heard for from three to nine seconds after the last respiration, then the diastole ceases, and for a few seconds the systole only is heard. The systole is the time during which death takes place. If, however, after it has ceased the thorax be opened and the heart exposed, the heart may again be seen to beat. From this it had been assumed that the heart continues to beat for some time after respiration ceases, and that if the latter can be re-established the heart will continue to beat. He felt sure, however, that the action of the heart on exposure was due to the stimulus from the air, and not to any real continuance of life. If a little chloroform vapour or a little cold air were blown over it, the pulsation ceased, and a little warm air would speedily recall it for a time. This contraction of the heart is not propulsive ; it does not distend the arteries, and is useless to start the circulation. The condition of the lungs also, like that of the heart, varied according to the speed of death ; if rapid, nothing unusual was found ; if prolonged, they were gorged with blood. If death had been very quick, they were bloodless ; if very prolonged, there was very great congestion. It was not difficult to explain this. In health there is always an accurate balance between respiration and circulation ; but when the supply of air is cut off, the oxygen in the lungs is gradually absorbed, and for a time the blood is kept in motion as in life, but as the heart receives no arterial blood, it ceases to propel the stream into the lungs. When the air is partially cut off, the diaphragm is fixed and the chest-walls firmly contracted, and the heart continues to force blood into the lungs until they are gorged. The brain is more or less congested as the death has been more or less rapid. It is rarely seriously injured so as to preclude recovery. The viscera of the abdominal cavity are generally congested. Cases of immersion in water varied in the morbid phenomena found at death. If an animal is drowned in a narrow vessel with its head downwards, the condition is pretty much the same as in stoppage of the windpipe. The same result is also obtained by immersing an animal in very cold water. If however, the animal is put into water at 96°, the result is the same as when air is slowly stopped—*i.e.*, there is blood on both sides of the heart. In cases of drowning at ordinary temperaetures, in the human subject the blood-corpuscles are unchanged, the blood is fluid, but it coagulates on exposure and is oxidisable. The heart is congested on the right side. The brain is congested, and sometimes there is effusion of serum, but no great organic change. The spleen and kidneys are congested. Different gases act differently ; some by preventing oxidation by their mere presence, as chloroform vapour : others as carbonic acid, by excluding air containing oxygen. The effect of chloroform vapour in preventing oxidation might be shown by putting a lighted taper into a jar containing oxygen. It would not burn in such a mixture. On the other hand, carbonic acid kills, as water does, by excluding air ; the animal is "drowned in the gas." Deaths from chloroform in the human subject give us no definite information as to the physiological action of this substance, as they generally take place in patients whose organs are diseased, and in which there have been attempts at resuscitation, and often loss of blood from operation. The author had made experiments on ninety-three animals, in order to ascertain the effects of chloroform in causing death, and as the results had been uniform, he felt justified in supposing that he had arrived at the true formula of morbid action. Apparently a paradox,—in these cases death took place from the heart, although the heart outlived the respiration. The heart, as the author had found by experiment, would beat some time after it was too weak to propel the blood into the aorta. The cardiac action was on the right side only ; so that really there was no paradox in saying that death began at the heart. After the action of the heart ceases, if the chest-wall be removed and the heart be exposed, the heart's action will begin again ; but the act is futile, and is unable to inject the lungs. When the air is removed, the action ceases. In all the experiments the lungs had been found free from congestion. The circulation gradually diminishes in power step by step ; at length the right side alone contracts, but enough only to show to the observer that the heart is acting not enough to propel the blood into the lungs. The Author then gave the details of his experiments with carbonic acid. He remarked on the general results to be deduced from the experiments, and afterwards proceeded to speak on the treatment of suspended animation. The following is a brief summary :—1. Artificial respiration is of avail in those cases only in which there is a stream of blood from the right to the left side of the heart. 2. That if this current of blood travels the arterial channels, the respiration will follow. 3. That warmth is of great value. 4. That galvanism is dangerous in all cases. 5. That after apparent death, but before the coagulation of the blood, restoration to life is possible.

A Paper, illustrated by many drawings and preparations, was then read by Dr. SIBSON, on *Aneurisms of the Arch of the Aorta*, which was of considerable interest, but was not finished for want of time.

ADDRESS IN MEDICINE, BY W. H. WALSHE, M.D., F.R.S.

We abstract the more salient points of this interesting address. After some introductory remarks, Dr. Walshe said : The existing advanced condition of Medicine, and its brilliant promise for the future as a means of positive knowledge, are, I think, primarily and essentially due to that spread of an improved observation among those working at clinical and subsidiary pursuits,—to that patience, precision, and minuteness with which facts are investigated and recorded. In days not very far from our own, or even by the most eminent in our ranks, the observation of medical facts was more or less openly contemned,—was disdained by pathologists of mark as a fitting task of the patient drudge rather than of the man endowed with intellect, capable of working out the alliances and repulsion of those facts, distinguishing their necessary probable contingent and purely accidental relationships, inducing therefrom general results, and co-ordinating these into a system. The correctness of the facts themselves, absurd as this may seem, was treated as matter of small importance ; the first comer, willing to undertake the work, was accepted on his own guarantee as an efficient and competent observer, while it was reserved for the intuitive aptitude of the systematiser to distinguish and separate the real from the unreal, arriving at an issue of pure truth from premises, confessedly containing variable quantities of jumbled truth and error. But two causes have been fatal to imperfect observation as a system, whether by proxy or otherwise. The first of these causes is the failure one after another of pathological doctrines founded upon it, a failure necessarily entailed by the abiding, inseparable influence of the original quantum of admixed error, by the impossibility of fashioning a total of truth out of elements partly true and partly false. It has at length been perceived that fundamental unfitness underlies the whole process. The second cause is, that observation is now undertaken by men fitted for the task, by men of large, natural, and trained endowment ; and the toil is undertaken by these because it is now generally conceded, and by them in particular has been intuitively felt, that the work of observation is alike difficult and exalted, that to make an observer requires a combination of faculties as high, though in some sort of a different order as to make a speculative thinker, that in the mass and main and as a rule, to observe facts is as lofty an expression of intellect as to conceive thoughts. True it must be admitted that in some men whom the *mens divinior* illumines, in whose brains a spark of divine essence scintillates, thought is grandest ; it goes before facts, it creates, it defines these, and leaves experience to drag its slow length along to the goal of truth itself has long since reached. But we speak of the ordinary type of intellectual men, not of those exceptional marvels of whom some two or three are vouchsafed to the world in the course of a century. The value of observation being granted, its true function in the establishment of Medical science being recognised, that the means of conducting it should be extended and improved followed as a necessary consequence. Hence that constant tendency to the employing of instruments of various kinds, characteristic of the clinical investigations of the day,—instruments which have enabled us in many cases to estimate the degrees of the objective phenomena of disease with an amount of accuracy, not figuratively, but literally mathematic. At last we have acknowledged that in Medicine there are no first principles within reach of human intellect at least, wherefrom we can descend to fact, *ad libitum ;* there are no axioms in our science wherefrom we may fashion theorems and deduce proportions that shall suggest physiological and pathological facts and establish a doctrine of

(Continued at page 118.)

THE MEDICAL CIRCULAR.

WEDNESDAY, AUGUST 13, 1862.

THE COLLEGE CONVERSAZIONE.

The Fifth of August must be recorded with white chalk as one of the happiest days in professional annals. The Council of the College of Surgeons did a wise and noble thing when they threw widely open the doors of the Institution and invited the Fellows and Members to walk in. Spacious as is the building, it was filled; and probably not fewer than a thousand Surgeons were assembled at the *Conversazione*. Tables were provided with microscopes, stethoscopes, drawings, and specimens. Instruments for exhibiting the marvels of spectral analysis were in one place, and crackling electrical machines in another. The walls were covered with drawings by the late John Martin, paintings by Millais, Landseer, and Cooke, and marbles of grace and beauty by Foley, Marochetti, Macdowell, Weekes, and other eminent sculptors. The preparations in the Museum were robbed of their mysterious awe by the brilliant gas-light, and Giant O'Brien seemed very much disposed to come down from his pedestal and make a bowing acquaintance with the fair Bosjesman in the opposite corner. There, too, was the statue—not yet chiselled in marble—of the great John Hunter, the presiding *genius loci*, looking earnestly into the future, and weaving with his profound philosophical speculations, pleasant thoughts of the reconciliation of the members with the Council, and the emancipation of genius from the restraints of conventionalism and class prejudices. It was all very pleasant—the greetings of old friends, the smiles, the bows, the buzz of talk, the crush in the library, the getting up stairs and the squeezing down, the bright light all around, the unaccustomed cheerfulness of the "funking-room," the gloomy gaiety of the Museum, the good-cheer at the refreshment-stalls, the ice, the wine, the "nods and becks and wreathed smiles" thereto belonging, the courteous dignity of President Luke, and the general coming and going, animation and delight.

This is too successful an attempt at hospitality not to be repeated. We beg to inform the Council that we can bear it once in a year. We do not want a formal invitation, but will come without asking if the tables be spread and the gas laid on. Our contemporaries do not like these social gatherings, and prefer big square cards and no company. Too much happiness makes them uncomfortable; they, can, therefore, stay away. For our own part we can endure a heavy down-shower of gladsome hospitalities without saturation. For ourselves, therefore, and in the name and behalf of every man—not having in him the conceit of journalism—who accepted the Council's invitation on the 5th inst., we beg a repetition of the opportunity of exchanging kindly talk and brightening up old reminiscences, at least once in a year.

The request is not unreasonable. Looking at the income of the College, the Council need not grudge the expenditure of one or two hundred pounds for gas and refreshments on such an occasion. The members have long eagerly desired some kind of recognition in their own College; and it would be an act of good policy on the part of the Council if, at the present crisis, they associated themselves more intimately with the members. Access to the reading-room and museum are only cold comfort which not one in a hundred of the members cares to avail himself of in the course of his life; but a single bidding to a social reunion brings within the portals of the College half of those who live within a radius of five miles, and a considerable number from all parts of England. Let not the Council despise the signs of the times. They have had ample evidence of what would be agreeable to the members; and they may, without the exercise of much penetration, predict the influence upon the prosperity of the College that will result from a liberal execution of the proposed reforms as regards an examination in surgery at the College of Physicians.

Unless a wise and liberal policy towards the members should be now inaugurated, the Council may be assured that the College has attained the climax of its influence and power. From this time the descent to a lower stage may begin, and that pre-eminence which the Council have been so sedulously building up upon a policy of exclusion may be lost, because they were unable to see that the time had arrived when new ideas made it necessary to adopt an opposite policy in order to maintain it.

THE BRITISH MEDICAL ASSOCIATION.

The Association has had a round of gaieties during the week, and our provincial brethren have, we hope, dissipated to their entire satisfaction. The College of Surgeons has entertained them nobly, and the College of Physicians has given them the free use of its halls for their meetings. All has gone "merry as a marriage bell;" but are there no misgivings of future strife? Is it not odd that a society with an income amounting 2,820*l.* 15s. 9½d. is compelled to accept gratuitous hospitality, and cannot give a sup of tea and cake to its members? The least we could have expected is that the Council would have had the means of providing a *soirée* for its own members, and not have been so exclusively dependent upon the bounty of other bodies. All the money is, however, cast into the bottomless pit of journalism, and the Association is left helpless for everything good, useful, or generous.

We have adverted to the income of the Association; it is sad to see how this large sum is appropriated. The entire executive expenditure, including the salaries of secretary and clerk, is only 180*l.* 16s. 9d. All the rest, with the exception of a balance in hand of 107*l.* 5s. 2½d., is absorbed by the Journal! *Two thousand five hundred and thirty-two pounds thirteen shillings and tenpence* are cast annually into its open throat. It seems, however, that the members are beginning to feel dissatisfied with this misappropriation of their subscription; for we understand that last year there were more than *five hundred* defaulters! This fact is blinked in the Financial Report, but during the meetings a discussion arose as to the best method of dealing with these gentlemen. Numerous propositions were admitted; but the Council fear to bring their house of cards to the ground. As an evidence of the deceptiveness of the Financial Report, we will put two or three facts in connection. They say they have a total number of 2,120 members, the actual defaulters being more than 500. Then, also, they say they have enrolled 130 new members during the year; and have lost by resignations 75, by deaths 30, by erasures 25, making an aggregate by losses of 130, exactly the number that have enrolled! Clever conjurors! This is what is called "cooking accounts" to make things pleasant. In order to appear at their London meeting with undiminished strength, they erased only a sufficient number of members to balance their losses against their gains. This is a poor trick. Let the committee honestly strike off the 500 names of mem-

bers whom they admit have not paid their subscriptions, will not pay, and cannot be made to pay. The Association owes 666*l.*, so that if their defaulters do not send their subscriptions—and we are quite sure they will not—the time is not distant when the Association will be insolvent once more, and must clear off its debts by a private subscription. Could mismanagement and improvidence be more clearly manifested?

SUMMARY OF THE WEEK.

THE HARTLEY INSTITUTION.

There has been a contest at Southampton for the office of Curator and Chief Librarian of the Hartley Institution. There was a large number of candidates, but the choice of the Council ultimately settled upon Dr. Bond, who was formerly Dean of the Faculty and Professor of Chemistry in Queen's College, Birmingham. This Institution promises to be a great advantage as well as attraction to the inhabitants of Southampton.

THE ROYAL COLLEGE OF PHYSICIANS.

The Fellows have adopted the new bye-laws, and henceforth the College resumes its original power of including *Surgery* in its examinations for its licence. It will now require attendance on a six months' Course of the Principles and Practice of Surgery and a six months' Course of Clinical Surgery. Examiners in Surgery, Midwifery, and the Diseases of Women will be appointed. Neither the College of Surgeons nor the Apothecaries' Society will like this improvement; indeed, we have noticed unpleasant signs of perturbation on the part of the Apothecary interest. The deed is done, however, and the friends of the other corporations must be content to suggest doubts, if they cannot applaud.

THE LATE DR. M'WILLIAM.

A committee has been recently formed to raise a fund in behalf of the bereaved family of the late Dr. M'William, a man of great talent and many useful services. His labours on behalf of the Navy Surgeons will be long remembered with gratitude. He has left, it appears, a large family of daughters. This fact alone will quicken the sympathies of our readers and prompt them to aid the fund according to their means.

THE ASSOCIATION'S JOURNAL ONCE MORE.

This unfortunate bit of property causes uncommon anxiety to the Association. The President is very desirous of improving it, and, to effect this object, attempted last Wednesday, after the delivery of Dr. Walshe's Address, to prevent its publication in the regular Medical journals. He publicly called upon Dr. Walshe to retract a promise which he had given, on the ground that the addresses read at the meeting were the *property* of the Association, and could be published in its own journal alone. A clever attempt, no doubt, to monopolise the interest of the meeting in behalf of the Association's jejune and ricketty organ. It is clear enough that if the independent journals publish a complete report of the Association's proceedings, and publish it, too, in anticipation of its own journal, there is really no good reason in maintaining a journal at all! It can only publish the intelligence of its own Society at second-hand! Thus we see how the false position in which the Association is placed leads to an exclusive, jealous, wrangling spirit, which makes it the enemy of a free press, and of the rapid and unrestricted diffusion of truth. How long shall this continue? The 'Journal' is already extinguished by the more decisive and intelligent action of the independent Medical periodicals.

THE HEALTH OF THE CITY.

We learn from Dr. Letheby's quarterly report just issued that there has been a large increase of typhus fever in certain parts of the city; and what is remarkable that it has been more fatal among the better classes than the poor. The mortality from fever has advanced from 25 to 53 deaths during the quarter, and the sickness from fever has increased from 1 to 10 per cent. The epidemic which has prevailed in the Metropolis this year is said to have been traced to the immigration of mendicants labouring under the disease. If this be so, we shall be asked to reconsider the notions now popular as to the etiology of fever. On the other hand, it must be remembered that the atmosphere has been, during the past quarter, saturated with moisture, the average being 87 per cent., and on some occasions for a week together, cent. per cent. The rain-fall has also been heavy, there having been 52 wet days; and nearly eight inches of rain have fallen. So we must take both causes, and perhaps some others, not yet detected, into account.

A NEW WAY TO PAY OLD DEBTS.

The address of the new President of the British Medical Association, Dr. Burrows, was eminently significant of the changes of opinion now in progress and afforded great encouragement to all sincere reformers. It was nothing less than a plea for unity,—for a one Faculty Board—for the Profession! The College of Physicians is rapidly casting its old imbricated covering, and coming out in the purity and beauty of a new life and creed. Years ago we implored the College to take the general practitioners under its sheltering wing, convinced that it would be to its own interest and the well-being of the profession. The College has accepted the advice, and seems resolved to carry out the idea freely and fully. The more liberal it becomes, the more it will prosper.

SMALL-POX AMONG SHEEP.

This malignant disease has appeared among a flock of sheep, in the upper parts of Wiltshire and Hampshire, belonging to Mr. Parry, of Allington, and has caused the death of a considerable number. It is characterised by the ordinary small-pox pustules, which are abundant over the body, and especially on the inner side of the legs. Where the pustules have broken, ulcers have, in some instances, formed, which secrete a most offensive matter. There is also a loathsome and sanious discharge from the eyes and nose. Mr. Simonds, the Veterinary surgeon, was consulted, and he advised the inoculation of the entire flock, 1,700 in number; which has been done. This epidemic has excited the greatest consternation among sheep-breeders, as it is, when once established, of a most contagious nature. It does not appear that this particular form of disease is communicable to other animals or human beings, but is confined exclusively to sheep. The first epidemic of the kind appeared in this country in the year 1847, having been imported by some Spanish sheep which were received into Smithfield market. From thence it spread among some flocks in Berkshire, Wiltshire, and Norfolk, but was soon extirpated. No evidence as to its origination by contagion is discoverable in the present instance, and it is supposed, therefore, that it has broken out spontaneously. Many of the ewes are already convalescent.

PRESENTATION TO DR. ALEXANDER GUTHRIE, OF BRECHIN.—on Thursday last, in name of about 400 subscribers, the Earl of Dalhousie presented Dr. Guthrie, Brechin, with his portrait (painted by Mr. Colvin Smith), a handsome silver centrepiece, a tea and coffee service, also in silver, and an elegant clock in bronze. The presentation took place in the East Free Church, Brechin, in presence of a very large audience (including Sir James Campbell of Stracathro, Professor M'Cosh, Belfast; Rev. Dr. Guthrie, Edinburgh; Sheriff Currie, &c.), and was on the occasion of the Doctor completing his fiftieth year as a medical practitioner, the whole of the time having been spent in Brechin and neighbourhood. The Earl of Dalhousie, in making the presentation alluded to what was comprised in fifty years' practice as a country doctor; and Dr. A. Guthrie, in replying, mentioned some of the incidents that had occurred in his own experience. Dr. Thomas Guthrie who is a brother of Dr. Guthrie of Brechin, then moved a vote of thanks to the committee.

THIRTIETH ANNUAL MEETING
OF THE
BRITISH MEDICAL ASSOCIATION.

(Continued from page 115.)

disease prior to experience. We have even recognised the cardinal principle, that whereas in certain other branches of human knowledge the deductive and inductive methods of obtaining truth are both applicable, in fact reciprocally sustaining the one, often supplying what the other is unable to give. In our sphere of mental work the smallest step cannot be made by the light of deduction. We begin from individual facts, rise to those general inferences which are our most comprehensive expressions of attainable truth. Dr. Walshe then dilated on the errors of the deductive writers and teachers, as Broussais, Cullen, Hume, and commented on their intolerance. Note the dogmatism of Broussais. See him denounce all theorists but himself, and revile searchers after facts, just as certain speculative theologians proclaim that tolerance for any creed but that fostered by themselves is positive impiety. Do I exaggerate in affirming that a few years past it was a work of danger, a sort of chivalry in the field of science to oppose a prevalent dogma of the so-called physiological school; that a man who failed to comprehend was simply regarded as a dolt, while he who ventured to question took his place among the crazy ones of his day? But if we may fairly assume that the deductive method is banished as an acknowledged scientific instrument from the domain of pathology, it is equally certain that indications of an unfortunate disposition to return to it every now and then make their appearance; and yet there can be no reasonable apprehension that any *à priori* systems of pathology will again take serious hold of the Professional mind. If men will for once, and once only, accept the warning offered by the history of the past, that history not only teaches us the absolute failure of all such systems, but shows that so long as deductive methods prevail, all progress must, if not solely, at least essentially, consist in the destruction of something that has gone before; the energies of genius must be wasted in negativing the errors of the past. It is noteworthy enough that the story of Medical progress in this aspect gives feeble support to—nay, almost clashes with—the opinion held by some speculative historians, who regard the dominancy of inductive reasoning as especially characteristic of the Anglo-Saxon mind. The general proposition may be true, or it may be false. I rather think the former; but unquestionably the Celtic mind of France has taken a very large if not the largest, part in establishing the supremacy of induction as a real instrument for discovering Medical truth. Nor, Mr. President, must we forget, as an element of modern progress, that the true function of hypothesis has been fixed; on the one hand, escaping the grave fallacy of the deductive system which first assumes the hypothesis, then assumes its absolute truth, and next reasons down to facts; on the other, we have learned to steer clear of the almost equally serious error of rejecting hypothetical propositions altogether. Hypothesis is now valued at its worth; it is accepted as an instrument of suggestion; it is welcomed as a clue which guides the senses in the observation of facts, and so saves frequent waste of time and energy in the search after, and registration of, particulars that bear little or no relationship to each other, and must *pro tanto* prove unsusceptible of furnishing general conclusions. We pass on to the next cause of existing progress,—the recognition of the true significance of so-called pathological laws. When Louis first promulgated a series of general propositions on which this title was bestowed, the word was accepted in a more absolute sense than it can fairly command. It was supposed by some ardent persons that these laws were as stable as laws of the growth, decay, and death of the organism, nay, as the physical laws of the universe. It came to be held that it would be well-nigh as positive an infringement of the order of nature, were a tubercle found in any other organ than an adult whose lungs were free from that product, as if the movement of bodies were detected in infraction of the law of gravitation. But the day of these delusions has passed away, we now know that those general results which we take for the expressions of pathological laws in the sense of fixed force,—pre-ordained and immutable relationships of antecedence and consequence without reference to those deeper metaphysical meanings that underlie the idea of law, have nothing of this scope, of this absolution, of this grandeur. A larger experience than that which originally worked out these presumed laws has shown that they are not laws at all. In the higher significance of the term, a law of nature knows no exceptions; the so-called pathological laws, on the contrary, are subject to perpetual exceptions; in point of fact they are, at best, the generalised expressions of degrees of frequency. When we say, for example, it is the law of such and such a disease that such a combination of circumstances occurs in it, we really mean no more than that in a certain calculable majority of instances of that disease, that combination will occur. Now, in thus relinquishing the ambition of establishing laws of pathology assimilable to, and co-ordinate with, laws of nature, we appear, instead of advancing, to have receded. The progress here savours somewhat of a negative quality it is true, but the ultimate value of surrendering vain pretensions has in all sciences been positive. Closely linked to its improvement, allied to it in nature stands the corrected estimate of the men of to-day concerning the true import and value of the numerical method, especially in its application to clinical medicine. So long as any one mode of combination of certain clinical facts and conditions can only be spoken of as more or less frequent than another or other possible combinations, the want of definiteness in the idea, and in its expression, only deprives both of either scientific or practical significance. But the case is changed by the aid of the simple process of counting, a distinct numerical value is substituted for the vague words "more or less;" for concede, as we have already done, that the numerical expressions of precise degrees of frequency do not carry with them, either strictly or inferentially, a revelation of laws in pathology, still they most certainly present average combinations of phenomena of disease in the mass, and so oftentimes furnish most valuable peeps through the obscurity surrounding the natural affinities and repulsions of morbid processes. Now these numerical expressions are of course perfectly sound, so far as the particular mass of facts from which they were derived is concerned, and they will continue to be sound if applied to a fresh mass of cases of the same nature, arising under similar conditions. But a function of more practical importance than this was at one time assumed for it; it was supposed that numerical expressions signifying majorities of variable strength, might be subsequently applied in individual cases with almost unfailing surety. Is this the fact? I fear not. It may, for instance, be perfectly true, is perfectly true—that in the great majority of instances, chronic peritonitis in the youthful adult is not only diathetic, but especially attached to a certain diathesis. The tuberculous, if not a law, which certainly it is not, this is, at least, a rule; but if we apply this rule to individual instances, and attempt by its aid alone to found the diagnosis of tuberculous peritonitis, possibly in the very first instance that comes before us of a character to test the point, our faith in averages as applied to individuals may be destined to be rudely shaken through the discovery that the chronic peritonitis before us sprang from cancerous and not from tuberculous seed. Now, in the recognition of the practical danger of a too absolute application of averages to individual instances there is progress. Some years past there existed much too great readiness to trust to these averages as sure elements of diagnosis. Let us not, however, run into the opposite extreme of undervaluing them. Even in this clinical sense they are of great subsidiary importance, and should never in the balance of *pros* and *cons* in a difficult diagnosis be omitted as more or less serious items of evidence. The lecturer then expatiated on the prevalence of the spirit of philosophic incredulity, and the overthrow of the reverence for authority. And so, he said, the day is gone when honest Medical men could be found the active or passive supporters of flagrant absurdities; absurdities made decent and becoming by high-placed assurance of their wisdom. When that remarkable sovereign, William III., in so many aspects advanced beyond the spirit of the age he lived in, strove to discountenance the superstition of touching for the evil, he was almost the solitary man of mark in his dominions who at once felt the stupid inanity of the practice, and dared run counter to the popular tide of folly. On one single occasion he is reported to have yielded to importunity, and to have laid his hand on a patient; but on that occasion, he at least soothed his moral and intellectual conscience by uttering the remarkable words, "God give you better health and more sense." "Theologians of eminent ability and virtue," says Macaulay, "gave the sanction of their authority to this mummery,"—a fact at which the distinguished historian does not appear to profess any particular marvel, but he does signify his wonderment that Medical men of high note were to be found among the supporters of the delusion; and yet as long as the system of authority in matters of opinion prevailed, how could it have been otherwise? While certain sections of the Church consigned even William himself to perdition, by stigmatising him as an infidel because he refused to believe that the touch of a particular finger could destroy a constitutional disease, it seems well conceivable that the struggling disciple of Esculapius might not, simply and alone, have felt it inconvenient and dangerous to expose the imposture, but that his intellect might have been at length mastered by his fears, and that he actually ended by believing in the folly at which his common sense and experience originally revolted; and if things are now changed, if the Medical Profession as a body stands as the practical bulwark of the present day against superstition of all kinds, the reason is, because they have shaken off the tyranny of authority, because they have learned to think for themselves, because they have recognised and utilised the elevating lesson conveyed in the sagacious and eloquent words of one of the greatest English prelates, Bishop Hoadley:—"Authority is the greatest and most irreconcileable enemy to truth and argument that this world ever furnished forth. All the sophistry, all the colour of plausibility, all the argument and the cunning of the subtlest disputer in the world may be laid open and turned to advantage of that very truth

which they designed to hide or depress, but against authority there is no defence. It was authority which would have prevented all reformation where it is, and which has just put a barrier against it where it is not." Such it appears to me, Mr. President, are some of the essential causes of modern progress. The greatness of Medicine appears to be indicated in the very character of the conditions that make the groundwork of that progress felt and acknowledged by the world without. To the consideration very briefly of this question I propose to devote the remainder of the time that we shall be together to-day. Dr. Walshe at great length and with much eloquence, combated the notions of those who said that Medicine was not a science, and defined the nature of Medical investigation. Comparing our Profession with the Law, he observed: See the difference in the problems with which we have severally to deal. We are called upon to penetrate the obscurest mysteries in the creation, the most entangled complications in the most elaborate of God's works,—the diseased actions and conditions of the bodily and mental man. Painfully toiling step by step a phenomena which to our limited ken are perpetually clashing with and veiling each other, assuming new forms. Chemistry, physics, and special dynamism associated in the most subtle combinations; they deal in the main with what they themselves manufacture, the laws of the statute book and formal precedents, things that are marked on the surface and deep into their substance with all the relative pettiness of human productions, and yet they are perpetually warring in their interpretation of those very small matters. We have to discover the hidden, the unknown, the uncontrollable; they to interpret the obvious, the known, the conventional; and yet to their own deficiency in the performance of this comparatively easy task they are proverbially purblind, while to the least trick on the part of those who deal professionally with the obscurities of physic they are lynx-eyed. And there is a third contradiction to which the forensic logic that would exclude Medical opinion, in the case of alleged lunatics, directly leads. Inasmuch as a conclusion must be drawn by the Medical untrained jury from the facts, and without any aid in the interpretation of those facts from persons whose previous business in life is to study such facts, the Bar become partizans of the general doctrine that the man who knows least about any given subject is best able to form a sound opinion concerning it. How this *reductio ad absurdam* is to be evaded, even by legal sharpness, I confess appears to me impossible to imagine. If it be urged that in many instance of alleged lunacy where the legal question of competency to manage affairs is an essential question, the case is often a complex one, other matters besides psychial peculiarity being mixed up with the inquiry; if it be pleaded that there may be and often are circumstances lying without the pale of purely technical interpretation, which may be as clear to ordinary men as to those specially trained in cerebral pathology, and which furnish their contingent to the total judgment; if this be urged, as it is known to be urged in the very highest quarters, the answer is easy; for obviously any argument to be found here simply amounts to this, that one important element to a verdict is to be neglected because other evidence besides itself exists and may be utilised. Another objection made to the admission of skilled opinion in cases of lunacy is that Medical observers having arrived at certain crude disjointed theories concerning insanity, must perforce take certain views in individual cases accordant with those theories, and that, consequently, their argument is assured in the form of actual advocacy before the facts. But, in the first place, this objection, if well founded, would be equally fatal to the evidence of professional experts of every class, and, consequently, one of two things, either the facts are clear, self-evident, well-defined, when theory would not be wanting, or the facts are obscure and entangled, imperfectly defined, when the theory, if wrongly obtruded by the Medical witness, will prove totally without influence on the minds of the jury. To this fragmentary notice of the subject of skilled testimony in cases of lunacy, I must limit myself on the present occasion. I have merely glanced at some without even remotely pretending to have exhausted the consideration of any one of the numerous fallacies of the opponents of such testimony; but I think I have said enough to make it at least strongly probable that the commonly paraded objections would not have taken the form of practical and active opposition had they not been sustained and encouraged by some form of support in the background, and that support I believe to be furnished by the prevalent notion, probably specially prevalent in the legal profession, of the non-scientific or feebly scientific character of our pursuits. In its general relationships to the march of civilisation, how is medicine regarded by the lay world? First, let us ask ourselves what are likely to be the claims of medicin (in regard to the civilising process, and what in general terms may be set down among its actual civilising achievements? It cannot apparently be questioned that civilisation has been the highest where intellectual development has obtained its maximum. This seems to be predicable, not only of different countries compared with each other, but of the same country at different periods of its own social evolution. The history of the world points to a direct ratio between vigour and buoyancy of national intellect and activity of material advancement; but the vigour of intellect could only be practically useful in so far as it is used for the discovery of the truth of things. Truth, then, is the real factor of civilisation. In proportion as it is worked out, so has advanced or will continue to thrive civilisation. Now, medicine has, except in the rarest instances, exhibited itself in the van-ground in the honest search after the truth of Nature as she is. To the Medical philosopher truth, irrespective of the consequences to which its discovery may seemingly or really lead, has ever been the ultimate object. In this aspect the calling he exercises, as also the method and manner of knowledge on which that calling rests, stands at the absolute head of human pursuits. Contrast him with professional theologians, ever dreading lest some new revelation of Nature's ways may falsify some cherished dogma, and consequently oftentimes exercising his fullest influence to thwart the demonstration of those laws the Creator has designed for the regulation of the universe. Remember Galileo! See of what dignified honest life Medical work is composed in comparison with the professional advocate, who starts on his career with the fact staring him in the face that on the doctrine of chances one-half of his future years must be passed in advocating error and making the worst appear the better reason. What intellectual training is that of the Medical observer compared with that of the diplomatist, the quality of whose aspirations after truth may be gathered from the well-known apothegm of one of the most successful of his class, that the use of language was to conceal our thoughts. Compare the Medical thinker again with some self-elected teachers of psychical philosophy, who, revelling in the wantonness of undenied intellectual power themselves, write "Strange Stories," well fitted to shake the foundations of belief, to destroy all perception of the differences between the real and the unreal in persons of feebler organisations than themselves. It seems impossible, then, that in intellectual guidance and in civilising influence the medical philosopher could do otherwise than hold a high place to take other rank than amid those bands of inquirers who search for primal truth, fearless of consequences, among mathematicians, moralists, political economists, statisticians, amid the foremost, though often unseen movers in the march of progress. The civilising influence exercised by the medical profession in maintaining the bodily vigour of the individual citizen, in suggesting and perfecting the means to his physical development, in securing a healthy mind in a healthy body, in promoting measures of state utility wherever considerations of public health justify his interference, occasionally modifying the penal code in the sense of mercy, have ever been seen by all. Less obvious, but not less real, is the truth that medical inquirers have been pioneers and leading to the general adoption on the numerical, moral, social and political inquirers, the utility, nay, the necessity of which appears to have been first seriously felt through the proofs given by Louis that pathological facts which from their nature seemed to be unsusceptible of the process might be made the subjects of numeration and so forced to furnish inferences of deep practical significance unattainable by any other means. But I believe the unseen, intangible, underlying influence of the earnest truth-seeking quality of medicine plays a yet loftier part than any of its overt achievements of promoting the great cause of civilisation. Still, gentlemen, all this has been little recognised. Within our own ranks there have been few to receive it. Occupied with effecting a progress rather than estimating its mechanism, we have said little of our own claims as human civilisers. Lay notices, especially in this country, of the part we have played have been, as might be expected, from much that has been already said, to the last degree scanty and unsatisfactory, but a lay historian has at last appeared upon the field, who has not only himself felt, but has endeavoured to make others feel, that medicine *quoad* civilising influence has not existed in vain, has not been cultivated by some of the greatest among ancient and modern observers, of thinkers, without, in some measure, embracing contemporary civilisation. Henry Thomas Buckle, in the introduction to his vast proposed survey of the influence of human knowledge on the material progress of man, has assigned its place to medical philosophy in contributing to the civilisation that we glory in to-day. Dr. Walshe then enters in a warm and generous eulogy, not unmixed with criticism, of Buckle's historical labours. We must pass it over, however. Finally, he said, I have endeavoured thus to show to what causes the evident progress of modern Medicine is substantially and in ultimate analysis due, and it appears from the limited survey undertaken that these causes are of the most promising kind for the future of our Science. Medicine has, in truth, not advanced of late years from the exceptional achievements of any single individual gifted with extraordinary powers. Were it so, the continuance of progressive movement could not legitimately be looked for, as Providence but rarely sees fit to create specimens of the highest attainable power. No; our advancement has sprung from the substitution of one true for many false systems of duty, of one true system which is capable of being efficiently wielded by that multitude of men, no doubt with well-marked intellectual aptitude, honesty of purpose, zeal of character, and vigour of will, who are day by day added to the ranks of Physic, earnest workmen for humanity's good. And I have also produced some evidence that the importance of Medi-

cine as a portion of the vast edifice of human knowledge is beginning, not only to be vaguely guessed at, to be lightly and passingly touched upon, but to be seriously and systematically stated by laymen of the deepest read and most brilliant quality of thought. By this recognition of the nobleness of our studies, we are raised in the social aspect, and a worthy, kindlier reciprocity of scientific interest, between ourselves and the world of other professions for ever ensured. Our civilising mission is acknowledged and proclaimed, and so when we look around on other pursuits, and watch the men engaged in them, while we admire the toil and sympathise with the toilers, we need feel no discontent with our own. [illegible] We begin from individual facts, revelation of Nature's ways may [illegible] the most careful handlings,—more than these ferences which are our most comprehensive ex[illegible]d consequently oftentimes exercising his fulles[illegible]s work. To carry out fully cleanliness, baths, le truth. Dr. Walshe then dilated on the erro[illegible]he demonstration of those laws the Creator has[illegible]nt change of dressing and not of bed-linen, but iters and teachers, as Broussais, Cullen, Hum[illegible]lation of the universe. Remember Galileo [illegible] wards in Hospitals or rooms in houses. Mr. [illegible]t over the achievements of our years, "And I, [illegible]s comp[illegible] Paget next spoke of shock and reaction. Death from shock was too, tread the paths of Physic."

Professor Bennett (Edinburgh) rose to move a vote of thanks to Dr. Walshe for his able and eloquent address, which he eulogised in the strongest terms. He adverted, however, to the lecturer's expressions in respect to observers and the deductive method, and thought that justice had scarcely been done to the great men by whom the principles had been developed. What, after all, was the faculty of observation, the power of collecting facts, compared to insight of genius and the perception of law? He appealed to Harvey, to the *genius loci*, if he might so speak—the preparations relating to whose discovery were now before his sight—and asked, had not the deductions of this one man done incomparably more for Medicine than all the laborious efforts of those who had preceded him? With the exception that he could scarcely go with Dr. Walshe in his high estimate of mere fact collectors, he very warmly applauded his address. After alluding to several other instances in which the discovery of new laws had been followed by splendid results in the application of those laws to practical subjects, he expressed very confident hopes that Medicine would, before long, be able to take its place amongst the exact sciences. In eloquent terms he exhorted all to strive towards this result. In concluding, he adverted to the position at present occupied by the Council of Medical Education, and expressed much disappointment that more had not been done towards the adoption of some more uniform system. He begged the Council, in the name of the Association, to remember their responsibilities in this matter, and at once address itself to its most important duty.

The vote of thanks to Dr. Walshe having been carried by acclamation as Walshe said a few words in reply. He hoped Professor [illegible]sident, and the meeting would do him the justice to believe, that tion, Dr. [illegible] function of hypothesis has been [illegible]xed; on the [illegible]ncing, he did Bennett and the grave fa[illegible] of the deductive system which [illegible]erence for authority. And [illegible] in speaking highly of observation as a means of advance not mean unskilled observation. It was, of course, only when the facts collected were brought into contact with mind that any results could be looked for. He was reminded of what had once taken place in the ward of a Paris Hospital. M. Velpeau had occasion to reprimand a nurse for having disobeyed his directions, and she replied to the effect that having been twenty years nurse in that Hospital she ought to know something. "It is true, madam, that you have been twenty years in this ward, so has that stove, but it has not learnt much."

The meeting then adjourned for refreshments, after which

Mr. Ernest Hart gave a summary of his paper *On the Successful Treatment of Aneurism by the Flexion Method.*

The Twenty-Seventh Report of the Medical Benevolent Fund was then read. The balance sheet showed that during the year a sum amounting to 1,304*l.* had been received, and with the exception of 192*l.* in the banker's hands, expended. This was for the "donation account" alone. For the annuity account a sum of more than 4,000*l.* had been received, the greater part of which had been devoted to the purchase of Bank stock.

The adoption of the report and balance-sheet was moved by Mr. Heckstall Smith, who adverted to the simplicity of the means employed by the Society as one of its greatest recommendations. He had known instances in which a single letter of application and one of inquiry had been all that was needed to obtain efficient relief.

Mr. Propert seconded the resolution, and in warm terms commended the fund to the liberal support of the Profession. There was no rivalry between it and the Medical Benevolent College. Both were working in a common cause of charity and benevolence.

On the evening of this day a soirée was held at the College of Physicians. Dr. Watson presided.

Third Day, Thursday, August 7.

Papers were read by Mr. Solomon, Dr. Farr, and Dr. Budd, of Bristol.

The Address in Surgery.

Mr. Paget said that he had chosen, as one of the most important Surgical subjects, the treatment of patients after operation. He would, in the first place, lay down as a law, that recovery after injuries is generally a natural process. We are so constituted, that injuries bring about their own amendment. We are fitted, not only for the calm, but for the storm of life,—in fact, for all probable injuries; and amongst these are the injuries of Surgical operations. Yet, whatever may be our faith in natural recovery, there are many things left to do. One great object is to obtain as speedily as possible rapid union; for, when wounds are unhealed, pyæmia, erysipelas, and many other sore plagues of Surgery are apt to follow. In this process to healing, what we can do to help may be summed up in two words—repose and cleanliness. Quiet, not only of the parts injured, but of the patient, in every circumstance and detail; and cleanliness of air, water, and everything around him. The Surgeon's necessary interference should be of the gentlest kind, the [illegible] and consequently oftentimes exercising his fullest work. To carry out fully cleanliness, baths, [illegible] change of dressing and not of bed-linen, but [illegible] wards in Hospitals or rooms in houses. Mr. [illegible] of shock and reaction. Death from shock was rare, and he believed that reaction was never fatal, for reaction was not a disease. It was rather an example of the peculiar power of our bodies to return to health. Reaction in inorganic substance was always equal to the original force applied, but in the living organism it was greater. If the heart were depressed it tended to beat more strongly in reaction. Where muscle became depressed below a healthy standard, it tended not to return to healthy vigour only, but to become hypertrophied. However much, he said, reaction may simulate disease, we must consider it as really representing health. Although there is thus a natural process to recovery, there are yet many things left for us to do. Questions often arise for the relief of this and that difficulty. By cleanliness we shut out many a danger from without, and, also, by careful regulation of diet. Mr. Paget ventured to think that public opinion, which, many years ago, was inclined in one extreme, and which, three or four years ago, was in the other, was now in moderation in respect to the dietetic management of patients after operation. He then related one case showing a good and speedy recovery after severe operation, attended with loss of blood, upon a most sparing diet. The operator ascribed the good results to abstinence, and said that the diet could not be too low. Lately he had seen wine and brandy given in large quantities, and he had little doubt that these cases recovered just as quickly. This he did not think due to any change of type in disease, or any special circumstances, but to the natural tendency to recovery, a tendency generally so certain that neither surfeit nor starvation could avert it. He made these remarks, not believing that diet had nothing to do with the patient's recovery, but as strong tests of the natural process of recovery. Having made this clear, we could now try to treat our patients on rational principles, without unwise interference. Here Surgery has made a contribution to the natural history of disease. [illegible] the natural course of cases The question is often asked, what is the [illegible] left to themselves? Surgery has answered this question to some extent in cases of injury. By doing little we do not diminish the patient's chances, but rather help them. Midwifery in former times was meddlesome, but now the Accoucheur never interfered unless obliged, and yet the practice now-a-days is as successful as ever. It is half-informed ignorance, that from audacity or fright attempts to interrupt the course of nature. It would be very desirable, Mr. Paget said, most minutely to note the symptoms arising in the course of recovery after Surgical operations; and not only in severe cases, but also where there was any mischief, however small. Much and excellent work has been done in tabulating mortality after operation, but now we ought to know not so much the whole amount of mortality as its particular cause, and not only the causes of death but also the hindrances to speedy recovery. In cases of operation for hernia, tracheotomy, trephining, &c., the operation itself does not cause death; at the most the fault is that it does not more frequently save life. Mr. Paget said that in all his experience not one had died from the operation for hernia, yet nearly half of them had died after it. These cases should not be allowed to swell the amount. In another class of cases there were, as it were, casual causes of death, the patient dying of typhus, or typhoid fever, or of scarlet fever. There ought to be great care, however, in admitting such causes of death. Mr. Paget then related an anecdote of a French surgeon who said that he had never had a case of death after amputation of the shoulder-joint. One of his patients died, however, after this operation, but as he said, it was of pneumonia, or as we should now say, of pyæmia, and not of the operation. Mr. Paget said that he had scarcely ever seen a pure case of death from shock. They are extremely rare, and rarer than they were, partly from chloroform, and better treatment after operation. The loss of blood, the alarm and terror, and in spite of anæsthetics the violence to the nervous centres, each require separate consideration. But when all concur it is difficult to assign its share to each, and yet it is necessary to study them and their individual effects. Since the introduction of chloroform it has, he thought, been the habit to attach too much importance to the loss of blood in producing shock, and too little to the shock of the nervous system, which shock is felt although masked by anæsthetics. In the treatment it is enough to maintain life at the lowest level, and desirable to do it with the smallest amount of stimulants, and wait for reaction. The recovery

from shock is not steady, but vibratory,—the patient is now better, now worse, although, on the whole, tending to recovery. He doubted whether death from reaction ever occurred, and he doubted even whether acute traumatic fever is ever fatal. The greater evil is when reaction is not complete, when it is faulty or too long delayed. Then the patient cannot be left alone, reaction must be accelerated by stimulants. Then again, hurried reaction with disorder and delirium,—action without power,—is a perilous condition. This condition is found in the intemperate, in the anæmic, whose constitutions are more liable. The great remedy here is opium, which acts probably by restraining waste of tissue, and thus preventing the development of purposeless force. Shock falls on the whole body as well as on the part injured, and so does reaction, but they especially affect the part injured. Sometimes the part even dies, or, on the other hand, when reaction sets in, passes into acute inflammation, with no more than local harm. In case of very extensive operation, or in operation on parts essential to life, such as ovariotomy, sudden death would occur, just as death follows on perforation of the intestinal canal. Deaths from a similar cause used often to occur after lithotomy; but such deaths are now rare, and this is due to improved treatment, and because there is less active bleeding. Really the thing in these cases to be met is shock, and not the inflammation, and the treatment should be stimulants and opium. He felt that he could scarcely speak too well of chloroform in diminishing mortality from shock; and yet it had one great defect—in producing sickness. This is a most unfavourable complication: it complicates the severity of the shock, and is not controllable by medicines. Deaths often occurred previous to the introduction of chloroform after trivial operations; and probably death is now often put down to chloroform when it is really due to the shock of the operation, however trivial. Mr. Paget then spoke of tetanus, erysipelas, and pyæmia as causes of death. These complications should, he said, be studied from the general condition of the system, just as the eruptive fevers. Mr. Paget related a case in which a child after lithotomy was attacked by measles. An eruption at first appeared about the wound; but that this and the accompanying constitutional disturbance was due to measles was soon proved by the eruption extending all over the body. Just as this case was considered from the general constitutional condition, so ought cases of erysipelas and other affections following operations, although the most prominent symptoms are local. The slight local inflammatory symptoms which appear very soon after operation ought not to be mistaken for those which are more serious, and come on several days afterwards, passing into erysipelas, pyæmia, &c. The time at which these constitutional and local symptoms present themselves is a point worthy of the most careful record. Mr. Paget then spoke of the origin of pyæmia. He dwelt at some length on the phenomena of rigors, and proposed this subject as worthy of greater study than had yet been bestowed on it. He suggested that rigors should be considered in their relation to convulsions, and related several cases in point. He then passed in review the various influences affecting pyæmia and erysipelas. They were more likely to occur in the anæmic, the intemperate, and those who had lived on an excess of animal food, and especially those whe suffered from granular degeneration of the kidney. Yet pyæmia would occur in those previously healthy. It would sometimes occur in its worst form in the best homes of the wealthy as well as in Hospitals. There was still great obscurity as to the cause of pyæmia. It was a subject well worthy of the most minute attention, and not only in cases in which the disease was acute and fatal, but also in simple and less acute cases. There had been lately, Mr. Paget said, great decrease in mortality, but still further reduction was to be earnestly sought. After surgical operation by the knife there were still great risks to life, and consequently we hear now and then from abroad of such barbarous substitutes as amputation of limbs by caustics or by the écraseur. Mr. Paget then referred to the small mortality after amputation in the Radcliffe Infirmary, Addenbrooke's Hospital, and the Hospital at Exeter. He hoped that by great care and further study the general mortality would be still further reduced.

Mr. Hey proposed and Mr. Hodgson seconded a vote of thanks to Mr. Paget for his able address. It was carried unanimously.

The late Professor Traill.—Died, at 29 Rutland square, on July 30, aged eighty, Dr. Thomas Stewart Traill, Professor of Medical Jurisprudence in the University of Edinburgh. Another link between the scientific generation of Sir Humphrey Davy and Cuvier and our own, is thus removed. Dr. Traill did not long survive his old colleague, Dr. Alison, and by his death the University has lost its oldest Medical celebrity. Dr. Traill was a native of Kirkwall, in which parish his father was a minister. Having studied at Edinburgh, he took his degree in 1801, and in 1832 he was appointed to the chair of Forsenic Medicine. He lectured to within a few days of his death. He was a man of extensive acquirement and considerable versatility. If a gap were created by the illness or resignation of any lecturer, Dr. Traill was always ready to fill it, and we believe, in turn, lectured on nearly every branch of Medical Science taught in the University.

REVIEW OF THE PERIODICALS.

The 'American Medical Times,' July 19. This number opens with a continuation of Dr. A. Jacobi's lectures on *Dentition and its Derangements*. There are several interesting points in this lecture bearing upon the relation between dentition and rickets. Virchow's observations on this subject are adverted to: we think Dr. Jacobi right when he considers that bad dentition does not produce rhachitis, though rhachitis may induce a protracted dentition as a part of the general defect in the formation of bone. Rhachitic bones contain an undue quantity of water, causing a "sort of serous mollification," which, perhaps, prevents them from assimilating as many phosphates as under normal circumstances. The deficiency of phosphates in rhachitic bones seems to be owing to the imperfect assimilation of Protean substances with which they are combined. We extract the following observations upon this subject:—

"To what extent Virchow is right in directing our attention to the connection between rhachitis, which is very common among the poorer class of society, and the absence of proteinous substances from the food, either breast-milk or artificial, is shown by every body's and every day's experience. Böcker found in the milk of a mother, who nursed a rhachitical child until it died at the age of fifty-three days, in 1,000 parts, but 13·111 of caseine, 23·31 of butter, 60·358 of sugar, and only traces of phosphates to the amount of 0·089. Friedleben has, in his 'Contributions to the Knowledge of the Physical and Chemical Contributions of Growing and Rhachitical Bones, in Early Infancy,' the following remarks:—I examined the milk of two women, whose children were brought up with breast-milk exclusively. The skeletons of both were rhachitical in their totality; both recovered, but only after their diet had been changed. One was a turgid, pale woman, of forty-six years, who had been bled several times during her pregnancy. Two specimens of her milk were examined, the first in the fifth, the other in the sixth month after the birth of her child. The analysis yielded, in 100 parts, in

No. 1.	No. 2.
Water, 87·829.	Water, 87·830.
Butter, 4·390.	Butter, 4·390.
Caseine and sugar, 7·542.	Caseine and sugar, 7·542.
Inorganic matter, 0·239.	Phosphate of lime, 0·069.
	Alkaline salts, 0·169.

The milk of the other woman, four months-and-a-half after the birth of her child, looked thin and serous like that above. Since her confinement, being at work and without medical attendance, she had been suffering from uterine hæmorrhages. She was tall and slender, and nearly forty years old. The analysis of her milk resulted in the following figures. In 100 parts of milk there were—

Water	91·307
Caseine, butter, sugar	8·509
Phosphate of lime	0·099
Carbonate of lime	0·010
Alkalies	0·073
Oxide of iron and silicium	0·002

The normal proportions in the healthy milk, not to speak of constitutional and other oscillations, differ considerably from the above, as is proved by the following figures of the several percentages of normal milk:—

Water	86·60
Caseine	3·50
Sugar	6·20
Butter	3·50
Soluble salts	0·06
Insoluble salts	0·14

From these statements it follows, that the milk of both women was below the average rate of proteine and hydrates of carbon. The earthy salts were also diminished, but they were fewer in the first case than in the second, while the rhachitis of the second was more decidedly developed than that of the first. Nothing else is required to prove that the diminished import of phosphates is neither the only nor the principal cause of rhachitis.

At all events, then, this much is understood now, that there are other important elements in what we have been used to call rhachitis besides the diminished amount of phosphates; and that want of phosphates and rhachitis, are by no means identical. Nor is the very nature of rhachitis explained by, or comprehended in, the process of resorption. This is best shown by those physiological experiments which allow a free absorption, but less access of earthy salts and phosphoric acid. Chossat has made the first series of such experiments. Friedleben made similar ones, allowing a number of pigeons no other food but vetches and distilled water.

Through five or six months they appeared to be well; then diarrhœa would set in, emaciation take place, and death from exhaustion ensue in the tenth month. The chemical analysis of their bones, compared with those of healthy pigeons, resulted in the following figures:—

Pigeon.	Bone.	Anorganic matter.	Organic matter.	Fat.	Carbonic Acid	Spec. gravity dried at	Spec. gravity dried in
Healthy.....	diaph. humer.	64·603	35·397	7·2			
Diseased.....	diaph. ulnæ, et radii.	87					

[illegible] (Edinburgh) rose to move [illegible] for his able and eloquent address, [illegible] strongest terms. He adverted, however, [illegible] bones [illegible] sions in respect to observers and the deduc[illegible] minu[illegible]ght that justice had scarcely been done to th[illegible] [illegible]om the principles had been developed. What, a[illegible] [illegible]aculty of observation, the power of collecting fact[illegible] [illegible]achitical [illegible]nsight of genius and the perception of law? He ap[illegible]early one-half [illegible]ey, to the *genius loci*, if he might so [illegible] specific gravity less. Car[illegible]elating to whose discovery were less than in the bones of the healthy [illegible]d not the deductions [illegible] of epiphyses or periosteum. These results depend on diminished assimilation, which, moreover, is distinctly proved by anatomical examination of the diseased bones. They are thin, fragile, not flexible; they are anæmic, and their medullary canals very wide indeed; the surface is uneven; there are intervals, interruptions, between the remnants of the bone and the dispersed osseous corpuscles, which are much less numerous and less regular than normal, to such a degree that Haversian canals between them are not recognisable. There was nowhere a trace of recent formation, only the proofs of normal absorption.

"Now, after having sifted to some extent whatever is known to this very moment on the anatomical and chemical nature of rhachitis, the most recent results included, and alluded to the usual alleged causes of this disease, I need hardly return to my former assertion, that dentition as such, and rhachitis, are in no causal relation to each other; at all events, there is no such connection between the two that the process of the protrusion of teeth could produce rhachitis. Not to speak again of the want of phosphates alone not constituting rhachitis, the amount of these salts slowly assimilated, for the formation of some teeth is very small in proportion to what is contained in the food. But surely the largely-diminished amount of phosphates introduced into the system (not only into the stomach), as being the result of the rhachitical process, well explains the slowness with which the teeth form and protrude in rhachitical children, and the simultaneous retardation of walking, and the slow ossification of bones generally. At another place, and in a former lecture also, I have spoken at some length of these matters. Thus we need not wonder that a rhachitical child who has no tooth at a year or later, cannot walk at the normal period, nor that its cranial sutures and fontanelles are not closed before the second or third year. But these latter anomalies do not depend on the retardation of the appearance of teeth, but all of them—retardation of the closure of the cranial bones, retardation of walking, and retardation of the protrusion of teeth—all of them are to be considered as the contemporaneous and co-ordinate results of the same fundamental morbid process."

We extract from the same journal notices of cases reported to the New York Pathological Society:—

"*Ante-Mortem Clot.*—Dr. Austin Flint exhibited a heart, in the left ventricle of which was found an ante-mortem clot, white and dense, arranged so as to form a coil partly around the columns of the mitral valve, tying it together. The liver and kidneys were fatty, the former weighing nine pounds. The symptoms immediately preceding death were, a feeble pulse and dyspnœa. The patient was in a semi-erect posture at the time death occurred. Dr. F. called the attention of the society to the accidental formation of clots in various diseases, and related two cases of pneumonia in which the patients of a sudden became afflicted with increased dyspnœa, the action of the heart at the same time becoming much enfeebled, and death following soon after."

"*Extirpation of Eye, etc.*—Dr. Noyes exhibited an eye which he had removed two weeks before from the person of a Medical man from the country, 36 years of age. The eye was lost in childhood by an injury which produced rupture of the globe, and for a period of many years it gave him no trouble, vision of the remaining eye continuing good. During the last three years, however, he began to have dimness in the sound eye, accompanied by muscæ volitantes. There was only occasional pain over the eyebrow of the lost eye. He came to New York in February last, and sought advice at the Eye Infirmary. There was posterior synochia present, and the pupil was reduced to two lines in extent. He was told that all the trouble was due to the injured eye, and that the remedy was extirpation. He returned home, not satisfied with the decision; but his eyesight deteriorated so rapidly, that at the end of a fortnight he again presented himself ready for any operation that might be deemed necessary. The injured eye was then tender on pressure, and he had suffered considerably from supra-orbital neuralgia. The vision of [illegible] eye was then so much disturbed, that he could [illegible]ading of a newspaper. The operation of ex[illegible], but he was soon afterwards seized with [illegible]r tissue in the orbit, which gave rise to [illegible]nptoms. A puncture was made deep in [illegible]sion, when the urgent symptoms subsided. [illegible]e remaining eye was chemotic, and dis[illegible]. Subsequently when this eye was examined, [illegible]ound so extensive as to leave very little hope of [illegible]erfect vision short of the formation of an artificial [illegible] examination of the eye that was removed showed that [illegible]d had undergone calcification, and the microscopic ex[illegible]nation disclosed the presence of bony matter already developed."

'British Medical Journal.' Dr. James Russell contributes some observations on the pain caused to the ligaments of the tarsus and other parts by unnatural stretching or fatigue. This pain is often felt where there is any abnormity of the foot, as flat foot. Speaking of one case, Dr. Russell says:

"He is a well-made young man, but looks delicate. His feet are large and well formed, excepting that the plantar arch is very defective, and yields readily to slight pressure with the hand, permitting the sole of the foot to be reduced to a perfectly flat surface. The internal lateral ligament of the ankle is very lax, and allows the foot to be readily twisted outwards (the outer edge upwards); and, in walking or standing, the foot is very visibly twisted in this manner, thereby occasioning the tarsal bones to project unnaturally beneath the inner malleolus, occasioning a prominence very sensible to the eye. The patient states that he has long been in the habit of wearing out the inner half of the sole of his boot before the outer. His gait is laborious, and destitute of the usual spring; and it is to be added, that his tibiæ are somewhat bowed —a circumstance probably much concerned in the production of his disease. The muscles of the leg are equally and well nourished. There is no abnormal tension of any of the tendons beneath the malleoli.

"The treatment adopted consisted of tonics; shower-bath; cold douche to the feet, with friction; rest; and two half-hours walk in the day, at separate periods. But the most successful remedy was constructed by the patient himself, after the nature of his disorder had been fully explained to him. It consisted of a pad inside his boot, so adjusted as to throw the bearing of his body at once upon the inner side of the foot, and upon the under surface of the tarsal arch. The plan succeeded admirably."

Other cases are recited.

Dr. Greenhow contributes *Clinical Illustrations of Diphtheria*, and Dr. Thomas Skinner, a paper on *Anæsthesia in Midwifery* He remarks:

"I do not believe that we are at present in the possession of any facts which will enable us to determine before-hand whether or not chloroform is likely to disagree with any one inhaling it. The only true and reliable test is to watch its *effects* on the patient's *respiration*, pulse, colour, and general appearance; the *quantity* and the *exact* proportions of chloroform and air being no guides whatever. We may examine the chest as carefully as we like for contraindicative symptoms, but we shall grievously err, if, in the seeming absence of them, we grant a certificate, verbal or otherwise, that the party is a fit subject to inhale chloroform. I would not wish it to be thought that I consider organic diseases of the chest in no degree to contraindicate the use of chloroform—a diseased organism can never compete with a healthy one—but I simply hold that organic disease is not nearly so great a contraindication as many of us are still inclined to think.

"The question is often put to me at what stage of labour ought chloroform to be administered?

"I am in the custom of giving it at all stages, whatever the state of dilatation of the os uteri; and I am of opinion that when an anæsthetic is resolved on it should be given *in toto*, or not at all, and having once commenced the administration, it should never be altogether withdrawn, except under pressing circumstances.

"I am frequently informed that it delays labour, encourages hæmorrhage, retards convalescence, and is otherwise followed by a multitude of evils. In short, it would appear that everything which happens of a sinister kind or out of the common run, during and for the next six weeks after the administration of chloroform in labour, is put down to the debit of the anæsthetic; even puerperal fever, mania, convulsions and pelvic inflammations.

"To such objections as these I have no hesitation in giving a direct negative. With the exception of a questionable tendency to the occurrence of hæmorrhage in some rare cases, chloroform may

be said to be perfectly innocent of all and every medical objection that has ever been raised against it in the practice of midwifery; and with little care and good management this accident may be avoided or easily remedied. An eminent authority, namely, the late Dr. Snow, has said that in his experience 'there has hardly ever been uterine hæmorrhage of any amount, except in patients who had suffered from it in previous labours.' I would further observe, that these and many other conditions have occurred and will ever occur in the practice of midwifery whether chloroform is administered or not.'"

Dr. SKINNER has invented a new apparatus for inhalation.

"1. The inhaler is a mask, the framework of which is of tinned iron or German silver wire. It somewhat resembles a fencing mask, excepting that it is covered with thin coarse domette instead of wire gauze, and that it covers only the lower half of the face. For convenience, it has a movable handle, and is otherwise made to fold up so that it may be carried in the pocket, hat, or case.

"The drop-tube is a tube of glass about two inches long, sealed at one extremity, so that a silver wire ligature only can pass; it is then thrust through a perforated cork which is inserted into a three or four ounce phial, and it is ready for use. The cork is more durable if covered with white kid leather. (Messrs. Maw and Son, have greatly improved this drop-tube by making it entirely of glass.)

"On inverting the bottle and drop-tube with chloroform in it, at no single inversion can more than thirty nor less than ten minims escape until it is reinverted. The advantages of such an arrangement will at once suggest themselves. The principle of this simple little invention is, that no more liquid can flow at one inversion, than is sufficient to allow the atmospheric pressure to balance the elastic force of the vapour of chloroform and air within the bottle. It might be called a pneumato-hydraulic regulator of chloroform. I will just add, that this drop-tube will serve for many other equally useful purposes, namely, for dropping collyria, for the administration of medicines in the form of drops, and as a 'poison cork.' For such purposes it is only necessary to incline the bottle until it begins to drop, when a child may almost be entrusted to drop laudanum with it. The leather covering over the cork is only requisite with chloroform.'"

The 'Lancet' opens with a continuation of Dr. PEACOCK'S lectures on *Fever*. Mr. HANCOCK contributes some further observations on *Division of the Ciliary Muscle*, and Mr. DANIEL GIBSON reports a *Case of Paralysis, with Loss of Speech*, from intestinal irritation in a child six years old.

The 'Medical Times and Gazette.' Mr. JOHN ADAMS reports a case of *Puncture in the Neck, with a Wound of the Internal Jugular Vein*. He adds some comments of a practical nature, which are highly interesting. We extract the case:—

"Mary Ann R., aged thirteen, servant, while cleaning the window of an upper room, was suddenly seized with giddiness (to which she was subject), and at once fell, passing through a skylight. She was picked up insensible, and remained so until she was brought to the hospital on June 9, half an hour after the accident. Upon admission, she was pale and exsanguine, evidently suffering from the effects of loss of blood. Upon examination by the house-surgeon (Mr. Gwynn), there was found a large, deep, irregular wound, situated in the right submaxillary space. No hæmorrhage was apparent at this time. The patient was then removed to the ward, and wet lint was applied to the wound. Mr. Adams's attention was shortly afterwards directed to the case; when, upon examination and removal of the clot, a gush of blood ensued, which was pronounced to come from the internal jugular vein. Mr. Curling, being in the hospital at the time, his assistance was promptly obtained. He divided the skin upon Mr. Adam's finger, so that the bleeding vein might be secured, but the withdrawal of the finger was attended with an immense gush of blood. Temporary pressure was, therefore, applied with the finger. As the amount of hæmorrhage was so great, and as it appeared impossible to reach the vein, Mr. Adams plugged the wound with pieces of sponge, and applied a compress. The patient was kept in the recumbent posture, with the head extended. Beef-tea and milk diet were prescribed, and a constant and careful watch was kept over the patient, in case of hæmorrhage.

"June 10.—No further hæmorrhage has occurred. The patient complains of some pain in swallowing; an enema containing tinct. opii. ℥xx., and two ounces of beef-tea, were administered every four hours. Passed a good night; was fretful and uneasy during the day.

"11th.—Seen by Mr. Adams. The bandage was removed, and spirit lotion was applied. The head is now able to be raised.

"12th.—Strapping removed by Mr. Gwynn. Sponge is still left in the wound, from which there is some sanious discharge. The adjacent parts do not appear inflamed.

"13th.—Improving. Extremely fretful. Linseed poultice to be applied to the wound.

"14th.—Progressing favourably. Seen by Mr. Adams, who removed one piece of sponge. Pulse 80. Sleep natural.

"18th.—Mr. Adams removed one piece of sponge, replacing another. Patient is now able to take solid food.

"30th.—Patient has gone on without an unfavourable symptom, is now up, and is able to take the ordinary diet of the hospital. The wound has healed, with the exception of a small, healthy, granulating surface, about the size of a shilling, which requires only simple dressing."

We will now reproduce the salient points in the commentary:—

"In the case before us, I acted according to the rule laid down, and, although the bleeding had ceased entirely, from the pallid aspect and almost pulseless state of the patient, I was certain a large quantity of blood had been lost. In this idea I was confirmed by Mr. Gwynn, the house-surgeon. I therefore introduced my fore-finger into the wound, which I found extended upwards, as far as the base of the skull, and on withdrawing it a large quantity of venous blood gushed out. I immediately re-introduced my finger and stopped the hæmorrhage. Of course, I could not safely remove my finger, and was very glad to avail myself of the assistance of Mr. Curling, who, with a bistoury, enlarged the wound on my finger, so that I might, if possible, reach the vessel and tie it; but the wound was so high up that this was impossible—and, as I was convinced that the internal jugular vein was the vessel wounded, I felt that no time was to be lost in seeking it. I therefore applied small pieces of sponge well pressed into the wound, and the hæmorrhage was arrested not to return; the sponge was confined by strapping and bandage. Now, you may say, is it right to put a ligature on the internal jugular vein? Certainly it is, unless you can stop the bleeding by any other means; and I candidly tell you, notwithstanding the fortunate issue of this case, if I could have found the wound in a convenient situation, I should have tied the vein. Perhaps it is better that I did not, as all hæmorrhage was arrested by pressure; but there is nothing so satisfactory in hæmorrhage as the ligature. I must tell you that the case was materially aided by position, for the head was made dependent backwards over a pillow, or, as the report says, completely extended, the patient being in a position as you may often see calves placed in as they are being brought to market in carts. The risk of phlebitis, which often attends ligatures on veins, is avoided by the employment of pressure. As the case before us illustrates the subject of wounded veins, and hæmorrhage resulting from such wounds, I may be excused from dwelling somewhat on this subject generally, and on this case in particular. Serious and fatal hæmorrhage from veins is not of very frequent occurrence, and perhaps that is one reason why no great deal of attention is given to it. When a patient dies from hæmorrhage, the blood usually comes from some large artery; but it happens now and then that fatal bleeding arises from wounded or divided veins; thus in the operation of lithotomy in persons advanced in years, I have seen such serious bleeding from the plexus of veins which surrounds the prostate and neck of the bladder as almost to destroy the patient; so also in amputation of the thigh, if the vein is cut obliquely most inconvenient hæmorrhage happens occasionally, and this more often occurs if no valves are near the divided end of the vein; when this happens it is better to dissect the vein upwards and cut it across at once, or if the bleeding still goes on, either a compress of lint must be applied with a ligature attached so as to facilitate its removal, or the vein must be tied.

"You will occasionally read in the public papers that a person has died suddenly in the street, or in a cab, or in a railway carriage, from the *bursting*, as it is termed, of a vein in the leg; this is no very uncommon occurrence. Frequently in the course of your experience at this hospital you will have cases brought in in consequence of hæmorrhage from an ulcer on the inside of the leg above the inner ankle. These are varicose ulcers, and I often take the liberty to ask the junior students what is to be done in a case of this nature? and the answer usually is, 'put a bandage on it, of course;' whilst the experienced surgeon says, place the patient on the back, and raise the heel, and the bleeding will cease. Now this is the plan you are to pursue, and many lives will be saved by this simple process. It is a very great pity that the public, or, at any rate, that the police do not understand this, for, by these simple means, death may be frequently averted. Instead of putting on a bandage just clap your finger on the ulcerated vein, place the patient on the back, raise the heel, and remove the garter. Position in Surgery is a great point, and in no case is its importance better exemplified than in this. In operations about the lower limbs, it is important to attend to this. In opening abscesses, or rather in dilating openings in the skin, you sometimes divide rather large veins, and they pour out a large quantity of blood which the patient cannot afford to lose; raise the heel, and it ceases immediately. So also in the bleeding which comes from the prostatic plexus of veins; you had better try what elevating the pelvis will do, before you resort to the unpleasant proceeding of plugging the wound."

Mr. GEORGE LAWSON contributes an article on *Photoplobia*, and Mr. KEITH MACDONALD a case of *Gangrenous Abscess of the Lung* supervening upon typhoid fever, which ended favourably.

GENERAL CORRESPONDENCE.

SPONTANEOUS RUPTURE OF SPLEEN.

To the Editor of the Medical Circular.

Sir,—Rupture of the spleen without violence being uncommon, I beg to forward you notes of a case in which I was called in by the coroner to discover the cause of death.

I am, &c.,

J. T. Holt Dunn, L.R.C.P. Edin., and M.R.C.S. Eng.

7 Carton place, Westbournia.

August 2nd, 1862.

Mary Ann Bloomfield, æt. twenty-nine, laundress, residing at 8 Chapel side, Bayswater, married nine years; has had four children and three miscarriages. General health good, except when pregnant; for many years past has been in the habit of carrying heavy baskets of clothes; is about four months advanced in pregnancy, and during the whole period has complained of pain inside the abdomen, but has not had advice or been under medical care.

Sunday, November 17, 1861.—Got up in her average state of health, went to a christening party in good spirits, and sang a song, but was hastily summoned to her sister, who was in a fit. On her return to the party, she complained of feeling cold and faintness, for which she took a glass of gin. Then she eat a good supper of bread and bacon, had another glass of gin, walked home a distance of nearly two miles, and went to bed between 12 and 1, feeling very cold. Her husband says her feet, which were habitually cold, felt like ice. She slept until 6.30 a.m. Monday, when she was awoke by one of her children crying. She then said to her husband "I have got the cramp in my belly," took 3d. of brandy in hot tea, and applied hot fomentations. A neighbouring surgeon sent her an anodyne mixture (without seeing her), and she took one dose, but continued sick, cold, and faint until noon, when she became more easy, and was being assisted out of bed to stool, when she fell back into her husband's arms a corpse.

Sectiv Cadaveris, Friday, November 22, 1861, four days after death. No marks whatever of any violence. Upon opening the cavity of the abdomen, a very large dark clot of venous blood was discovered extending over and covering nearly the whole superficial space; there was immense effusion, the abdominal cavity containing not less than five pints of fluid blood mixed with clots.

The *Spleen* was noticed as being somewhat enlarged, and its outer side ruptured to the extent of an inch and a half with a clot the size of a large walnut protruding through the orifice. The liver and other organs were quite healthy, as were also those in the thorax; the right side of the heart was perfectly empty, while the left was full. Upon dissection the *spleen* was found to contain a large clot divided into cysts by bands of lymph passing round their several parts and separating the clot into segments. In this case I think the splenic vein in the first instance gave way, why or when it is quite impossible to say; then adhesive inflammation was set up, and the increase of the clot for a time retarded by its acting as a plug, and sealing up the open vessel, and thus arresting the hæmorrhage; at last the pressure of the clot having thinned the wall, some exertion or probably the mental emotion consequent upon the sudden illness of the sister caused a slight rupture of the spleen. The hæmorrhage being again controlled by the presence of the clot in the orifice, which was no doubt much increased by the movements attending getting out of bed to stool, when I expect it gave way and severe bleeding took place. I, therefore, conclude that she died from internal hæmorrhage caused by rupture of the spleen induced by the primary rupture of the splenic vein.

SUBSCRIPTION FOR THE FAMILY OF THE LATE DR. McWILLIAM.

[The following letter has been forwarded to us with a request for its insertion. It gives us pleasure to comply with this request, and we trust that the object the Committee have in view will be realised to their satisfaction and to the comfort and consolation of the bereaved family.]

Sir,—We, the undersigned, have formed ourselves into a Sub-Committee to co-operate with a Committee already existing of Medical Officers of the Navy, in raising a fund among the Profession generally, for the Widow and Orphan Children of the late Dr. McWilliam, C.B., F.R.S.

Dr. McWilliam was so well known as to render it almost superfluous to state that in him were combined in a pre-eminent degree all the most estimable qualities of the medical character—professional knowledge and sound judgment, high moral courage, great benevolence and generosity, with indefatigable zeal and industry; and these qualities shone forth during the whole course of a public life marked by many memorable and trying events. Witness his active services, intermitted only by severe attacks of fever, in various ships on the West Coast of Africa, his most heroic exertions in the ill-fated expedition to the Niger, and, subsequently, his volunteer labours in investigating with such self-sacrificing zeal the yellow fever at the Cape de Verde Islands, which followed upon the fatal outbreak of that pestilence in H.M.S. 'Eclair.'

As Medical Inspector of the Customs during the latter years of his life, he displayed the same energy of purpose and devotedness to duty, and won the esteem and gratitude of all with whom he was associated. For his many valuable services he received in 1858 the distinguished honour of being made Companion of the Bath.

His leisure time was unceasingly given up to the advancement of professional science. From the formation of the Epidemiological Society he discharged with unflagging zeal the duties of Honorary Secretary, and his many contributions to its transactions, as well as his recent researches on the Health of our Merchant Seamen, brought before the National Association for the Promotion of Social Science, must be well known to all.

When we find that a man, who thus so honourably and so usefully spent his life, has left his widow and family without anything like adequate provision, we feel that this is no ordinary case, and that in contributing to a fund for the due support, education, and respectable introduction into life of eight young daughters prematurely bereaved of a father's care, the profession are but doing justice to their feelings of benevolence in a righteous cause.

We beg to subscribe ourselves,

B. G. Babington, M.D., F.R.S., Chairman, 31 George street, Hanover square.
J. Copland, M.D., F.R.S., Old Burlington street.
H. Mapleton, M.D., Deputy-Inspector of Hospitals, 6 Whitehall yard.
J. Simon, F.R.S., Privy Council Office, Whitehall.
Waller Lewis, M.D., General Post-Office.
R. D. Grainger, F.R.S., Highgate.
Ranald Martin, C.B., F.R.S., Mount street, Grosvenor square.
J. Propert, 6 New Cavendish street.
William Farr, M.D., F.R.S., Somerset House.
William Cooke, M.D., Trinity square.
Gavin Milroy, M.D., Hon. Sec., 149 Strand, or 8 St. John's Villas, Richmond.

*** Subscriptions by Cheque or otherwise will be received by all the Members of the Committee, or may be paid to the "McWilliam Fund," at the London and Westminster Bank, St. James's Square, S.W.

Births, Marriages, and Deaths.

DEATHS.

Edwards.—August 1, suddenly, Conway Thomas Edwards, M.R.C.S. Eng., L.S.A. Lond., of No. 21 Brompton row, formerly of Batheaston, Somersetshire, aged 52.

Keane.—July 25, George Keane, M.R.C.S. Eng., L.S.A. Lond., of Chipping Ongar, Essex, aged 51.

Lawrence.—July 18, Henry Lawrence, M.D. Univ. St. And., Consulting-Physician to the Carmarthenshire Infirmary, Justice of the Peace for the Counties of Carmarthen and Pembroke, and for the Borough of Carmarthen, of Chepstow, Monmouthshire, aged 77.

Macintosh.—On the 2nd inst., Richard Duncan Macintosh, M.D., of Dix's field, Exeter, aged 88.

Marshall.—On the 2nd inst., Thomas Marshall, M.D. Univ. Glasg., L.F.P.S. Glasg., of Barwood lodge, Helensburgh, Dumbartonshire, formerly of Glasgow.

Mitchell.—On the 1st inst., Edward Dawson Welbank Mitchell, Surgeon, of Lloyd street, Greenheys, Manchester, formerly of Newcastle-on-Tyne, aged 64.

Powell.—Recently, Charles Powell, M.R.C.S. Eng., L.S.A. Lond., of Haw house, Olveston, Bristol.

Traill.—July 30, Thomas Stewart Traill, M.D. Univ. Edin., F.R.C.P. Edin., Professor of Medical Jurisprudence in the University of Edinburgh, of Rutland square, Edinburgh, aged 80.

Wagstaffe.—July 13, Matthew French Wagstaffe, M.R.C.S. Eng., L.S.A. Lond., at Braunston house, Rugby, Warwickshire, of Walcot place, West, Kennington, aged 59.

Williams.—July 23, Rowland Williams, Surgeon, at Kentish town, aged 61.

MEDICAL NEWS.

Royal College of Surgeons of England.—The following gentlemen having undergone the necessary examinations for the diploma, were admitted members of the College at a meeting of the Court of Examiners on the 31st ult., viz.:—Edwin Hodgson Roe, Eccles, near Manchester; James Murray, Belfast; Henry Owens, Croydon; George Robert Morris, Charmouth, Dorsetshire; John Pooley, Huntingdon; Henry Seekamp Ward, Horncastle, Lincolnshire; Henry Charles Bury, Whitstone, Middlesex; Lewis La Mert, Bedford square; Alfred Woodforde, Plaistow; Henry Cheesman, Brighton; Howell Charles Phillips, Trinity square, Tower hill;

John Gregory White, Ampthill, Bedfordshire; George John Blasson, Billingborough; Charles Rhodes, Addison road, Kensington; John Sebastian Wesley, The Close, Winchester; Thomas Simpson, Boston, Lincolnshire; John Forrest, Blackburn, Lancashire; Lewis James May, West Putford, near Bideford; John Frederic Cobb, Norwich; Conrad Christopher Wimberley, Poplar Hospital; Henry Mortimer Hawkins, St. Mary's road, Peckham; and Henry John Sharp, Cornhill road, Islington.

Admitted on the 1st instant:—Charles Augustus Prater, Woolwich; Theodore D'Orville Partridge, York place; Charles Eugene Nelson, New York; Joseph Connolly, Belfast; Alfred Henry Brereton, Bow; William Rayner, Stockport; Melchior John Frederick Kranz, Melbourne, Australia; and George William Noad, Wokingham.

At the same meeting of the Court, Mr. John Keville Smallhorn, of H.M.S. 'Supply,' Woolwich, passed his examination for Naval Surgeon. This gentleman had previously been admitted a member of the College, his diploma bearing date October 29, 1858.

Apothecaries' Hall.—Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received certificates to practise, on Thursday, July 31, 1862:—William Warrener, Woburn, Beds; George Henry Maskelyne, Farringdon Berks; Henry Nanton Murray Sedgwick, Antigua, West Indies; Charles Henry Biddle, Newcastle-on-Tyne; Charles Albert Waterworth, Newport, Isle of Wight; Frederick W. Wright, Launceston; Walter Barker, Wantage, Berks; Edward Charles Bury, Wisbeach; Philip Candler Shepheard, Erpingham, Norfolk; Frederick Scott La Trobe, St. Mary's Hospital; F. W. E. Reinhold Goédicke, 4 Albert terrace, Notting hill; Lionel Booth, Greenwich; Albert McDiarmid, 5 Newton terrace, Rochester; Robert Richards Hawkins, Martintown, Dorset; Robert Hicks Beauclerc Nicholson, Hull.

The following gentlemen also on the same day passed their first examination:—Horace Cooper, Anthony C. Colborne, and William L. Barker, St. George's Hospital; Herman B. Holman, London Hospital; Anthony J. Newman, Middlesex Hospital; George Hurst Orton and Adolphus B. Great-Rex, St. Bartholomew's Hospital; John Henry Salter and F. C. P. Howes, King's College; Edward Thomas Blake and William F. Butt, University College.

The Rev. Mr. Livesey, Incumbent of St. Philips's Church Sheffield, has been let off with a nominal punishment, for the offence of certifying to the burial of the corpse of a man who had been dissected at the Anatomical School at Sheffield, whereas the remains of the man had not been buried at all. The trial took place at York, on July 24th, before Mr. Justice Mellor. It was stated, on the part of the prosecution, that an arrangement had been made by the sexton, Isaac Howard, with Mr. Barber, the Curator of the Sheffield School of Anatomy, by which the bodies taken for dissection by the Anatomical School should afterwards be taken to the burial-ground of St. Philips's, and be there buried in the cemetery, for which a fee of 13s. 6d., was paid, including the shell or coffin which was to be provided. Under the Anatomy Act, passed to prevent the disinterring of dead bodies, the law allowed only two classes of persons to be received in the Medical Schools for dissection—those who died in the workhouse unclaimed by their friends, and the bodies of persons who by will desired themselves to be dissected. This statute provided that any such bodies taken for the purposes of dissection should be placed afterwards in proper coffins, and be decently interred in consecrated ground, and that a certificate of the interment of the body should be then transmitted to the Registrar. The statute took every care that the remains of persons so dissected should be interred with all due respect. The body of the deceased man, the cause of the present inquiry, had been removed in a box, in a wheelbarrow, from the Medical School to the cemetery. It had been represented to the prisoner by the sexton that the body of a man had been received from the Medical School, and the prisoner had on that representation entered in the register the name of "Joseph Greatorex, Medical-hall, buried the 3rd of April—the ceremony performed by John Livesey." This was a false entry; the body was never buried at all, and the prisoner read no burial service and performed no ceremony over it. Mr. Livesey, in exculpation of himself, had written an explanation to the 'Sheffield Daily Telegraph' newspaper, stating in effect that the box had been placed in the coach-house, and that it contained a mass of decomposed matter over which he had not thought it right to read the burial service, and that it had been placed in the catacombs with the bodies of still-born children and other relics of humanity, over which the burial service could not regularly be read. It was stated, in evidence, that five bodies only per annum were dissected in Sheffield. The learned Judge affirmed distinctly the intention of the legislature that the bodies of dissected persons should be regularly interred with a funeral service, but summed up in favour of the prisoner. He was found guilty, and sentenced to a short imprisonment. We feel convinced that unless the public believe that the remains of dissected persons are treated with common respect, great difficulties will from time to time arise.—'Medical Times and Gazette.'

APPOINTMENTS FOR THE WEEK.

Wednesday, August 13.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopædic Hospital, 2 p.m.

Thursday, August 14.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m. London Surgical Home, 2 p.m.—Ruptured Perinæum; Vesico-Vaginal Fistula.

Friday, August 15.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, August 16.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital 2 p.m.

Monday, August 18.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1¼ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, August 19.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

A Chart of the Principal Constituents of the Urine in Health and Disease. By Dr. W. Stranger. London: H. Renshaw, 356 Strand.

The Spas of Europe. By Dr. J. Althaus. London: Trubner and Co., 60 Paternoster row.

Our Domestic Animals in Health and Disease. By J. Gamgee, Esq., Principal of the New Veterinary College, Edinburgh, &c. London: Hamilton, Adams, and Co.

NOTICES TO CORRESPONDENTS.

R. J. B.—1st. Certainly.—2nd. We cannot say.

A Member of the College.—We do not know whether the subscription for Hunter's monument is yet complete. We have no doubt that the Council will gladly receive your quota, if you should forward it. Mr. Weekes' model is full of animation, and characterises the keen searching genius of the man.

Dr. Scott.—We are obliged by the compliment.

Censor.—Received; but the article is too lengthy for publication.

A Reader.—Dr. Brown the author of 'Horæ *Subsecivæ*,' is still alive, and resides in Rutland street, Edinburgh. The extent of his practice we do not know; we hope that it is both large and profitable.

Delta.—Areometer is the name of an instrument for measuring the specific gravity of liquids.

F.R.C.S. Eng. writes "I cordially approve of your proposition for an annual Conversazione at the College of Surgeons. Don't let the subject drop. These things are the rage now; and the Council should not be permitted to go on in their old exclusive ways. If they don't do it, the College of Physicians will, and then it will be all up with the College of Surgeons." F.R.C.S. must not forget the subject at the next Fellows' dinner.

S. H. T.—1st. There is only one circumstance that justifies the opinion, viz., the occurrence of discharge after suspected conception; but that sign is delusive.—2nd. Yes.—3rd. It may be done as suggested.

A Member of the British Medical Association observes "I never thought our case so bad, until I read your article. It really is a shame that our large funds should be expended upon the Journal; but I think you put the figures too high. Our members are not numerous enough to produce such an annual subscription. We advise our correspondent to refer to his balance-sheet. All we can say is that if the members be not numerous enough to produce the amount, so much the worse, for we are correct as to the expenditure.

XX.—Our correspondent should attend Mr. Gulliver's lectures: we cannot promise. With reference to the point raised, we may say that the white corpuscles do not bear a definite proportion, even in health, to the red corpuscles; but vary, according to the experiments upon himself of Dr. Hart, of Zittau, from 1 in 400 to 1 in 1,800. After digestion the white corpuscles increase in number, decreasing again while fasting. It is absolutely necessary to know the conditions of the system in health, before any conjectures as to the influence of disease can be safely formed.

Mr. Franklin.—No.

Mr. Rogers.—Attended to.

Dr. Robinson.—Note received. The request shall be complied with.

Dr. Milroy.—Received, and attended to with pleasure.

Dr. Paterssen.—Letter received, a private note shall be sent.

A Correspondent asks: "Can you confer the obligation of stating the works or articles on Intermarriage of Relatives, for the information of yours, &c."

Vaccine Lymph.

To the Editor of the Medical Circular.

Sir,—Would you kindly inform me how I can obtain Vaccine Lymph as taken from the cow direct, notice of which appeared in the Medical Circular sometime ago, but I cannot find the number.

Friday, Aug. 8th. I am, &c., E. F. C.

St. Bartholomew's Hospital

and MEDICAL COLLEGE.—The WINTER SESSION will commence OCTOBER 1, with an Introductory Address by Dr. MARTIN, at Four o'clock p.m.

LECTURES.

Medicine—Dr. Black and Dr. Kirkes.
Surgery—Mr. Lawrence and Mr. Coote.
Descriptive Anatomy—Mr. Skey, and Mr. Holden.
Physiology and General Anatomy—Mr. Savory.
Chymistry—Dr. Frankland.
Demonstrators of Anatomy—Mr. Callender & Mr. Smith.
Demonstrator of Morbid Anatomy—Dr Andrew.

SUMMER SESSION, COMMENCING MAY 1, 1863.

Materia Medica—Dr. Farre.
Botany—Dr. Harris.
Forensic Medicine—Dr. Martin.
Midwifery—Dr. Greenhalgh.
Comparative Anatomy—Mr. Callender.
Practical Chymistry—Dr. Frankland.

The Hospital contains 650 Beds, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows, Dr. Farre, and Dr. Black; on the Surgical Cases, by Mr. Lawrence, Mr. Skey and Mr. Paget; and on Diseases of Women, by Dr. Greenhalgh.

Collegiate Establishment—Students can reside within the Hospital walls, subject to the collegiate regulations. Some of the Teachers connected with the Hospital also receive Students to reside with them.

Seven Scholarships, varying in value from 20*l.* to 50*l.*, are awarded annually. Further information respecting these and other details may be obtained from Mr. Paget, Dr. Martin, Mr. Callender, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomical Museum or Library.

Society for Relief of Widows

and ORPHANS of MEDICAL MEN in LONDON and its VICINITY. Instituted 1788.—EXTENSION of LIMITS.—All legally-qualified Medical Practitioners residing in the county of Middlesex, or within the limits of the London District Post, are now eligible as members of this Society.

Half-yearly relief is given to the Widows and Children under fifteen years of age of Members of at least two years' standing, if in diatressed circumstances.

The election is by ballot, at the four quarterly meetings of the Court of Directors, on the first Wednesday in March, June, September, and December; the proposal having been read at the previous Quarterly Court. Forms of proposal, &c., may be obtained from the Secretary, who attends at the office of the Society every Wednesday and Friday from Four to Five p.m.

S. W. J. MERRIMAN, M.D., Secretary.
53 Berners street, W.

Society for Relief of Widows

and ORPHANS of MEDICAL MEN in LONDON and its VICINITY. Instituted 1788.—The Members are reminded that a QUARTERLY COURT OF DIRECTORS will be held on the 3rd September next, at which Candidates for admission into the Society can be proposed. It is desirable that the form of proposal be filled up and forwarded to the Secretary a few days before the meeting. The form of proposal may be obtained of the Secretary. The benefits of the Society are restricted to the families of deceased Members of not less than two years' standing.

The Secretary attends at the office every Wednesday and Friday from 4 to 5 o'clock. S. W. J. MERRIMAN, M.D.,
53 Berners street, W. Secretary.

To Medical Men. — The

PROPRIETOR of a SANATORIUM and TURKISH BATH at one of our Fashionable Watering Places, from advanced age and failing health, wishes to meet with a Gentleman to assist him in conducting it with a view to Partnership, or the relinquishment of the whole to him. The net income is large, and daily increasing.—Address, M. D., 116 Camberwell New road, S.

Epilepsy. — Private Home

for YOUNG SUBJECTS of EPILEPSY.—The Advertiser, having for several years received a limited number of Epileptics of the middle and upper classes to reside under his superintendance, is enabled by experience to afford a highly desirable home for the physical and moral improvement of such Patients, and supplying an important auxiliary to Medical treatment.—For particulars, address J. R. Carter's News Office, Hampstead, N.W.

Medical Officers wanted.

THE LONDON EQUITABLE MUTUAL LIFE INSURANCE SOCIETY,
64 CHANCERY LANE, LONDON, W.C.

Trustees:—Right Honourable T. E. HEADLAM, Q.C., M.P.; Colonel CLIFFORD, M.P., and H. F. JADIS, Esq., Board of Trade.

The Directors continue to pay the following highly liberal Fees, in addition to the usual commission, in all cases where Assurances are introduced directly by Medical Gentlemen—viz., 3*l.* 3*s.* where the Policy is for 500*l.*, 2*l.* 2*s.* for 200*l.* to 400*l.* and 1*l.* 1*s.* for 100*l.*

MEDICAL REFEREES REQUIRED where the Society is not represented, — remunerative terms allowed. Apply to Dr. GEORGE ROSE, 24 Farringdon street, London, or to

JOHN LESLIE PILKINGTON, F.S.S.,
Manager and Secretary.

TO THE MEDICAL PROFESSION.

Charcoal Biscuits for In-

DIGESTION, HEARTBURN, &c. &c., manufactured from the purest Vegetable Carbon. Sold only in tins, at 1*s.*, 2*s.*, 4*s.*, and 8*s.* each, by J. L. BRAGG, Sole Manufacturer, 2 Wigmore street, Cavendish square, London.

Chemists and others allowed a liberal discount.
Post-office Orders made payable at the Old Cavendish-street Branch.

Guy's Hospital. — The

MEDICAL SESSION commences in OCTOBER. The Introductory Address will be given by J. COOPER FORSTER, Esq., on Wednesday, the 1st of October, at two o'clock.

MEDICAL OFFICERS.

Physicians—G. H. Barlow, M.D.; Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.
Assistant-Physicians—S. O. Habershon, M.D.; S. Wilks, M.D.; F. W. Pavy, M.D.
Surgeons—Edward Cock, Esq.; John Hilton, Esq., F.R.S.; John Berkett, Esq.; Alfred Poland Esq.
Assistant-Surgeons—J. Cooper Forster, Esq.; T. Bryant, Esq.; Arthur Durham, Esq.
Obstetric Physician—Henry Oldham, M.D.
Assistant Obstetric Physician—J. Braxton Hicks, M.D., F.R.S.
Surgeon-Dentist—J. Salter, Esq.
Eye Infirmary—John F. France, Esq., Consulting Surgon; Alfred Poland, Esq., Surgeon; Charles Badder, Esq., Assistant-Surgeon.

LECTURERS—WINTER SESSION.

Medicine—Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.
Surgery—John Hilton, Esq., F.R.S.; John Birkett, Esq.
Anatomy—Alfred Poland, Esq.; J. Cooper Forster, Esq.
Physiology—F. W. Pavy, M.D.
Chemistry—Alfred Taylor, M.D., F.R.S.
Experimental Philosophy—C. Hilton Fagge, M.B.
Demonstrations on Anatomy—Walter Moxon, M.B.—Assistant-Demonstrators—J. Bankart, Esq.; C. Hilton Fagge, M.B.
Demonstrations on Morbid Anatomy—S. Wilks, M.D.

LECTURERS—SUMMER SESSION.

Demonstrations on Cutaneous Diseases—W. W. Gull, M.D.
Medical Jurisprudence—Alfred Taylor, M.D., F.R.S.
Materia Medica—S. O. Habershon, M.D.
Midwifery—H. Oldham, M.D.
Ophthalmic Surgery—A. Poland, Esq., and C. Bader, Esq.
Pathology—S. Wilks, M.D.
Comparative Anatomy—F. W. Pavy, M.D.; W. Moxon, M.B.
Practical Use of the Microscope—Mr. Durham.
Dental Surgery—Mr. Salter.
Botany—C. Johnson, Esq.
Practical Chemistry—W. Odling, M.B., F.R.S.
Demonstration on Manipulative and Operative Surgery—T. Bryant, Esq.
Vaccination—J. Braxton Hicks, M.D., F.R.S.

The Hospital contains 600 Beds. Special Clinical Instruction given by the Physicians in Wards set apart for the most interesting cases.

Clinical Lectures—Medicine, Surgery, and Midwifery—Weekly.

Lying-in-Charity—Number of cases attended annually about 2,000.

Twenty-six Beds for Diseases of Women. Thirty Beds for Ophthalmic Cases.

Museum of Anatomy, Pathology, and Comparative Anatomy, Curator—S. Wilks, M.D., contains 10,000 specimens, 4,000 drawings and diagrams, a unique collection of Anatomical Models, and a series of 400 Models of Skin Diseases.

Gentlemen desirous of becoming Students must give satisfactory testimony as to their education and conduct. They are required to pay 40*l.* for the first year, 40*l.* for the second, and 10*l.* for every succeeding year of attendance, or 100*l.* in one payment entitles a Student to a perpetual ticket.

Dressers, Clinical Clerks, Ward Clerks, Obstetric Residents and Dressers in the Eye Wards, are selected according to merit, from those Students who have attended a second year. A Resident House-Surgeon is appointed every six months from those Students who have obtained the College Diploma.

Six Scholarships, varying in value from 25*l.* to 40*l.* each, will be awarded at the close of each Summer Session, for general proficiency.

Two Gold Medals will be given by the Treasurer—one for Medicine and one for Surgery.

A Voluntary Examination will take place at Entrance in Elementary Classics and Mathematics. The three fire Candidates will receive respectively 25*l.*, 20*l.*, and 15*l.*

Several of the Lecturers have vacancies for Resident Private Pupils.

Mr. Stocker, Apothecary to Guy's Hospital, will enter Students, and give any further information required.

Guy's Hospital, July, 1862.

To Students, Surgeons, Dentists, and others.

The best House for Second-

HAND INSTRUMENTS, where there is the largest Stock in London, is Mr. WM. LAWLEY'S, 78 Farringdon street, City. Army and Navy Regulation Cases, Pocket Cases, from 14*s.* each; Dissecting Cases, at 8*s.* 6*d.* and 10*s.* 6*d.* each. And, if you require NEW INSTRUMENTS, the well-known House of MILLIKIN & LAWLEY, 161 Strand, adjoining King's College, is the best in London, where every description of Instrument or Surgical Appliance may be had on the most recent principle and the shortest notice.

N.B.—A large Stock of first-class Instruments always on Sale, at the lowest cash prices. Instruments Bought, Sold, or Exchanged.

DINNEFORD'S

Pure Fluid Magnesia,

now perfect in purity and strength.

"Mr Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—'Pharmaceutical Journal,' May, 1846.

This excellent remedy, in addition to its extensive sale amongst the public, is now also very largely used for DISPENSING. In the stone jars (half-gallon, 5*s.* 6*d.*; gallon, 9*s.* 6*d.*,) specially adapted for the use of Medical Men and Chemists. To be had from the Manufacturers.

DINNEFORD and CO., Chemists, 172 Bond street, London; all Wholesale Druggists and Patent Medicine House.

St. Mary's Hospital Medical

SCHOOL.—The WINTER SESSION will commence WEDNESDAY, OCTOBER, 1st, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Dr. SIEVEKING, after which a CONVERSAZIONE will be held.

As an incentive to Clinical Study, the Medical Appointments in this Hospital, including FIVE HOUSE-SURGEONCIES, have always been open to its Pupils without additional Fee or expense of any kind: thus offering advantages, both professional and pecuniary, of far more value to the Student than any system of Scholarships or Prizes.

Physicians—Dr. Alderson, Dr. Chambers, Dr. Sibson, Dr Handfield Jones, Dr. Sieveking, and Dr. Markham.
Surgeons—Mr. Comlson, Mr. Lane, Mr. Ure, Mr. Spencer Smith, Mr. Walton, and Mr. J. Lane.
Physician-Accoucheur—Dr. Tyler Smith.
Ophthalmic Surgeon—Mr. White Cooper.
Aural Surgeon—Mr. Toynbee.
Surgeon-Dentist—Mr. Sercombe.

LECTURES.—Medicine: Dr. Chambers, and Dr. Sibson. Surgery—Mr. Lane and Mr. Spencer Smith.—Physiology: Dr. Broadbent.—Anatomy: Mr. Gascoyen.—Operations on the Dead Body: Mr. James Lane. — Dissections: Mr Norton and Mr. Coombs.—Chemistry—Mr. Field.

SUMMER SESSION.—Midwifery: Dr. Tyler Smith and Dr. Gruilly Hewitt.—Materia Medica: Dr. Sieveking.—Botany: Dr. Dresser. — Medical Jurisprudence: Dr. Sanderson.—Practical Chemistry: Mr. Field.—Ophthalmic Surgery: Mr. White Cooper.—Aural Surgery: Mr. Toynbee. Dental Surgery: Mr. Sercomb.—Comparative Anatomy: Mr. Mivart.—Natural Philosophy: Mr. Smalley.

Clinical Lectures on Medicine and Surgery are delivered twice a week, throughout each Session by the Physicians and Surgeons.—A Maternity Department is attached to the Hospital.

Students are required to perform the duties of Clinical Clerks and Dressers in each Session during the last two years of their curriculum.

PRIZES, &c.—A Scholarship in Anatomy of the annual value of 25*l.*—A Prize of 20*l.* for Students of the First Year.—Prizes in the several Classes, at the end of each Session, of the average value of Five Guineas.—Two Prosectors, who each receive 5*l.* and a Certificate.

The Fee for the Hospital Practice and Lectures required by the Colleges of Physicians and Surgeons, and the Society of Apothecaries, is 89*l.* 5*s.*, which may be paid by instalments.

A detailed Prospectus will be sent and further information obtained on application to

GEO. G. GASCOYEN, Dean of the School.
St. Mary's Hospital, August, 1862.

Taunton Union.—The Board

of GUARDIANS of this Union are desirous of receiving applications for the appointment of Medical Officer, (duly qualified), for the West Monkton District, comprising the parishes of Cheddon, Fitzpaine, Creech, St. Michael, Durston, and Monkton West.

Area, 7,222 acres, Population, 2,885; Salary, £75 per annum.

In addition to the salary, the officer will be entitled to the Fees specified in the order of the Poor-Law Commissioners of 24th July, 1847. He will be appointed under the Act for Vaccination, with a fee of 1*s.* 6*d.*, or 2*s.* 6*d.* for every successful operation by him, according to distance, and 2*s.* 6*d.* per case for each quarterly visit to lunatic paupers resident in the district.

Information as to the duties, &c., may be known on application to me.

Testimonials of qualification, &c., to be left at my office on or before the 15th August next, and personal attendance at the Taunton Union Workhouse at Noon on the following day (Saturday, the 16th), when the election will be proceeded with, is indispensable.

JOHN CHORLEY, Clerk.
July 19th, 1862, Registry place, Taunton.

MERIT ACKNOWLEDGED!

INTERNATIONAL EXHIBITION, 1862.

The Jurors of Class III have, after a searching series of analysis, awarded a

PRIZE MEDAL

for the "Purity and Excellence of Quality" of

WOTHERSPOON'S

VICTORIA LOZENGES,

Purchasers of which may rest assured that all are made of equal quality to those exhibited. They are flavoured with Peppermint, Cinnamon, Rose, Lemon, Musk, Lavender, Clove, and Ginger, and are to be had only in packets labelled 'Wotherspoon's Victoria Lozenges,' at 1d., 2d., 4d., 8d., and 1*s.* 4d. each, of all respectable Grocers, Confectioners, Druggists, &c.

WOTHERSPOON & CO., GLASGOW AND LONDON.

Lithographic Printing by

STEAM.—J. CROSS and SON execute in a superior style, on very moderate terms, every description of Commercial Lithography, Steel, and Copper-plate Engraving and Printing. Contracts with large consumers. Wedding and Visiting Cards, Invitation Notes, Envelopes, and every description of Fancy Stationery.—J. CROSS and SON, Lithographers, Engravers, Steam-machine Printers, and Stationers, 18 Holborn hill, E.C. Established 1813.—Works, Baldwin's gardens

Bowles and Sons, Label and

GENERAL PRINTERS, ENGRAVERS, &c., GEORGE STREET, MANSION HOUSE, LONDON, E.C.—Surgeons, Hospitals, and Dispensaries supplied with Gummed Labels and every description of Printing on highly advantageous terms, and of the most finished style and workmanship.

Dispensing Labels—Plain, 2d. per 100; Engraved, 4d. per 100. Blanks, 2d., 2½d., and 3d. per 100 Retail, 2d. per 100. Catalogues on application

MEDICAL CORRESPONDENCE.

ART. 6263. TREBLE PREGNANCY; RETENTION OF THE THIRD FŒTUS BY HOUR-GLASS CONTRACTION OF THE WOMB.—The retention of a fœtus in multiplex pregnancy being of rare occurrence, I forward an account of a case of the kind which may, perhaps, present some interest to the readers of your valuable periodical.

Mrs. D——, at Aressy, near Pau, aged thirty, had given birth in three successive labours, to three healthy children, when she again became pregnant. The abdomen acquired unusual size, and parturition set in at the beginning of the ninth month. Labour-pains were experienced in the morning of April 8th, and at two p.m. the patient was delivered of a puny infant of the female sex, which lived but a few hours. The midwife in attendance having then ascertained that the hand of a second fœtus was presenting, summoned me at once. Slight hæmorrhage was present, and at the back of a loose portion of the placenta engaged in the uterine orifice, I detected, through a membranous envelope, the hand which the midwife had felt. The contractions were feeble and unfrequent, but the woman being well formed and the flooding unimportant, I deemed that the expulsion of the second fœtus might be trusted to the unaided efforts of nature.

I, therefore, merely prescribed a dose of ergot, but as the uterine action remained inefficient, in order to obviate exhaustion from loss of blood, I inserted my hand, lacerated the membranes, and extracted by the feet a living boy.

The difficulties of the case were not, however, at an end. The abdomen was still voluminous, and it was evident that the distention of the womb was not merely caused by the presence of the placenta. On examination, I was not a little surprised to find a well-marked, narrow passage, leading into a cavity in which a third fœtus was included. The shoulder presented, and turning was not effected with the same ease as in the former instance; it was difficult to reach the cyst-like cavity, its orifice was powerfully contracted, and I should have been unable to bring matters to a satisfactory conclusion had I not secured one of the feet in a ligature.

One placenta only existed; its length was about fourteen inches, its width five or six inches, and the three cords were inserted at equal distances from each other.

I cannot doubt that the hour-glass contraction, in every respect similar to that which occasionally causes retention of the after-birth, was induced, in the present instance, immediately after the extrication of the second child. When I first examined the patient, the abdomen presented no irregularity, which might lead me to suppose that partial spasmodic action existed. The circular constriction here described, therefore, occurred most probably after the turning, and rapid extraction of the second fœtus.

— CAZABAN, O. S.,
Bordes (Hautes Pyrénées.)

ART. 6264. SERIOUS SYMPTOMS INDUCED BY A SMALL DOSE OF SULPHATE OF QUININE.—It is a well-known fact, that under the influence of peculiar idiosyncrasies, poisonous effects may be induced by drugs habitually innocuous. A nearly fatal occurrence which I witnessed on the 14th of May last, illustrates the remark, and is, doubtless, referable to some such predisposition.

A single woman, aged thirty-two, of highly nervous constitution, and delicate health, took in one dose, without medical advice, eight grains of sulphate of quinine, for the purpose of arresting irregular paroxysms of intermittent fever. It was then half-past five o'clock in the morning: the patient awoke at seven with most intense colic and pains in the bowels, refrigeration of the surface, rigor and difficulty of breathing; a cold perspiration broke out, she fainted away, and was carried back to her bed, the hyposthenic condition increasing every instant. The face was livid, the eyes sunk and convulsed; the pupils were dilated, the teeth clinched, the limbs inert, and she took no notice of any questions addressed to her.

I was summoned in all haste to her assistance, and was informed on my arrival, that some very slight amendment had taken place. The sufferer evidently heard my questions, and stammered an answer; respiration was accomplished without impediment, and the pulse was low (60). I prescribed the application of cold vinegar and water compresses to the head, of warmth to the extremities, an aperient draught, and an enema containing valerian and assafœtida, to be injected as soon as the heat of the body was restored.

In the course of an hour, marked improvement was visible; the pulse rose to 80, and the singing of the ears and tinnitus set in. The menses made their appearance a fortnight before their usual time, and on the following day naught remained beyond a sense of general fatigue and some headache.

I may, in this instance of sudden cinchonism, point out as especially noticeable, that colics preceded the nervous disturbances of the organs of hearing; also the slow manifestation of the latter, the dilatation of the pupils, and the sudden and premature occurrence of the catamenia.

— GELINEAU, M.D.
Ruelle-sur-Touvre (Charente).

SCIENTIFIC MISCELLANEA.

ART. 6265. RULES FOR SEA-BATHING.—It may not be inappropriate, at the approach of the warm season, to reproduce for the benefit of our readers a brief summary of a paper, published in the 'Gazette Hebdomadaire,' by Dr. Dutrouleau, inspector of the sea-bathing establishment at Dieppe.

The object of the memoir is to indicate with precision the rules for sea-bathing with the greatest possible benefit.

The first question that arises is that of the bathing dress. Mr. Dutrouleau observes that it would be desirable, if possible, to dispense with it altogether, and that it should consist of a loose garment of light texture, in order that the water should, during the entire bath, be in direct contact with the skin. The author also recommends that the head be uncovered, and that for ladies the hair should be confined in a net, which is far preferable to the oil-cloth cap adopted by French ladies in general. When not prevented by any peculiar circumstances, the patient should bathe in the morning, before the heat of the day. Should this not be practicable, the more favourable hour will be between three and five in the afternoon, which is likewise the proper time for a second bath, if the subject bathes twice in the day. This matter is further subservient to the meal-hours. In general, it is best to alter these as little as possible, even at the sea-side; but the peculiar susceptibility of the stomach must be consulted. Persons accustomed to take luncheon should continue to do so, if the digestive functions are regular; debilitated subjects, women and children especially, should make it a rule to eat between breakfast and dinner, and will find the habit conducive to more powerful reaction. The bath should be taken an hour and a half, or two hours after a light breakfast. Persons unaccustomed to eat in the middle of the day, or who digest their food slowly, must bathe fasting. But if debilitated, they will find it safer to postpone the bath to the afternoon, four hours after the morning repast. Another point is the expediency of bathing when the body is heated by exercise, or whether it should be allowed to cool before entering the water. A moment's reflection on the conditions most favourable to reaction, will lead to the conclusion that the twofold mechanism by which it is induced, will work with greater energy if the body is warm at the time of the bath. It is, therefore, proper to take moderate exercise before bathing, and to allow the excitement to subside in part only before venturing into the sea.

The mode of entering into the water is a detail, which, despite all prudential considerations, often leads to evil consequences, from apprehension or unconquerable antipathy to the

first sensations of cold. As a principle, the entire body, including the head, should be as much as possible simultaneously immersed, in order that the concentration of vital power be at once general, prompt, and regular. The methods employed for the attainment of this object are various, but do not admit of all the measures too often indulged in to diminish the severity of the first unpleasant impression. To plunge boldly into the water and to crouch in it, is no hardship to a practised bather, but it is a more severe ordeal to nervous, delicate, or timorous individuals. Such persons should trust themselves entirely to the accompanying guide, and adopt one or other of the following procedures:—The first consists in standing in the water while several pailfuls are poured over the head; the bather should then rapidly enter the sea and squat down so as to be completely immersed. Certain forms of disease are especially benefited by this system, but it is repugnant to many persons. The other plan consists in being carried in by the guide, and horizontally plunged head foremost beneath the wave. Mourgué denounces this as a cruel operation, and it would be open to the objection were it compulsorily enforced; but when it is performed with the full consent of the party concerned, and promptly and dexterously managed, it is far from unpleasant, and proves beneficial. These methods may be tempered so as to be made acceptable to the most nervous subjects; but slow and progressive immersion is contrary to every principle of the bath, may be productive of unpleasant symptoms, and must on no account be tolerated. Compulsion, on the other hand, should never be resorted to, and if, after several attempts, the subject cannot be induced to bathe in a safe and rational manner, it is best for him to give up all idea of sea-bathing.

It is of extreme importance not to stand motionless in the water with one-half of the body in contact with the air. Persons who cannot swim should grasp the hands of the guide, or the ropes provided in some bathing establishments for the purpose; they should exercise, and periodically allow the waves to break upon the sides or shoulders, and occasionally lie on their back, horizontally supported by the guide, and, best of all, learn to swim, carefully avoiding to exceed the proper duration of the bath. The latter is, perhaps, the most momentous of all the questions involved in the subject, and has the utmost influence on the results of each bath, and on the ultimate consequences of the treatment. The duration of the bath must depend upon the object to be attained, and should receive some modifications according to age, sex, constitution, and the nature of the disease of the patient. When powerful reaction is required, the bath should be short, last one or two minutes only, and at first consist merely in one or two immersions; its duration may be gradually extended to five and even ten minutes, when the system has become accustomed to the procedure, but under peculiar circumstances, and in warm latitudes only can fifteen minutes be allowed. The mechanism of reaction fully explains the precept. Seasoned, healthy bathers may remain longer in the water: in the Mediterranean and at Arcachon, an hour is sometimes spent in the sea. Bathers are, moreover, warned by a sensation of chill that it is time to dress; a repetition of the shivering would entail nervous depression. All the bad effects of sea-bathing are attributable to the immersion being too protracted for the power of reaction of the body. We may further remark that the weather, the sea, and the health of the patients are liable to diurnal changes which may require corresponding modifications in the practice of bathing, and that it would, therefore, be highly injudicious to lay down beforehand unyielding rules for the guidance of persons who repair to the sea-side.

On leaving the water, the usual precautions consist in promptly returning to the tent or bathing machine, the body being at the same time covered with a loose flannel wrapper. Some persons derive benefit from affusion of sea-water over the head, at the conclusion of the bath. The body should be promptly dried and well rubbed with a rough towel, the clothes be rapidly resumed, and a walk of a mile or two taken at once to promote reaction. When the refrigeration has been very considerable, and that warmth does not readily return, auxiliary measures may be resorted to with advantage—the warm foot-bath, for instance, which is very generally adopted at the various bathing towns on the Channel Coast. This appliance has been the object of much censure, and should not, perhaps, be resorted to as a rule; but when the feet are very cold, and shivering is present—a frequent occurrence after sea-bathing—it is, in Mr. Dutrouleau's opinion, the most efficacious method of restoring heat, and one of the best promoters of reaction. Persons who can dispense with it will do well to do so, but those who require the foot-bath may take it without fear. When general debility retards reaction, a glass of generous wine, or a warm cup of some aromatic infusion, are excellent auxiliaries; but pedestrian exercise is indispensable, and if the patient is debarred by general weakness from walking, he should be conveyed home and go to bed, or lie on a couch with wrappers for an hour. Whatever means are adopted, reaction is the object which must be obtained.

Art. 6266. Destruction of Nasal Polypi with the Bichromate of Potash.—Bichromate of potash is a moderately powerful escharotic, the peculiarity of the action of which is to cause atrophy of the textures it is placed in contact with. A wart touched with a solution of this salt becomes hard, and dies away. In this instance the mass is dried up, and for the same reason, Mr. Nélaton had recently recourse to the bichromate in a case of framboesia of the scalp; it has also been applied for the cure of hæmorrhoids, condyloma, vegetations, &c. The *Annales de la Société de Médecine de Gand*, inform us that Mr. Frédéricq having satisfied himself of the efficacy of this caustic for the destruction of venereal excrescences, resorted to a saturated solution of bichromate of potash in water, for the treatment of polypi of the nose.

From a favourable report on these experiments by Dr. Dumoulin, we gather that Mr. Frédéricq had thus effected a cure in about twenty cases of polypus.

That surgeon applies every day with a small brush, the solution over the portion of the growth accessible to the eye, avoiding as far as possible touching the adjacent parts. At first neither pain nor irritation of any kind is complained of; but in the course of three or four days generally, inflammatory action sets in which sometimes extends to the nose; that organ swells, and a watery and sometimes acrid secretion is induced. These symptoms should however occasion no uneasiness, they never last beyond forty-eight hours, during which active absorption takes place, and when the local irritation subsides, the polypus is found to have partly or altogether disappeared.

Sometimes a dry, brown coloured eschar forms, but the result of the treatment is the same.

When the first signs of inflammation are observed, pain being the most prominent, Mr. Frédéricq at once discontinues the application of bichromate, which he resumes, if necessary, when the symptoms have yielded. A cure has been frequently effected in five or six days after a single cauterisation. Here as in venereal excrescences, a relapse is unfrequent.

The cases of polypus in which this treatment was instituted varied as to the number, size, and form of the growths. The patients were women, several of whom were more than fifty years of age. The tumours were all mucous polypi, with the exception of one, which was fibrous, and does not appear to have been radically cured.

Mr. Frédéricq states that this remedy causes the prompt absorption of syphilitic vegetations and of mucous papulæ, but that warts are much more slowly cured by the same process. In the former, inflammatory action frequently sets in, and mortification followed, affording satisfactory evidence that genuine cauterisation had been effected. But the general tendency of Mr. Frédéricq's cases implies that the action of the bichromate chiefly consists in powerfully stimulating the absorbents: "It would seem," says he, "to check the formation and increase the destructive processes in the living structures of the system."

Art. 6267. Case Illustrative of the Efficacy of Fucus Vesiculosus for the Cure of Obesity.—In a recent number (Art. 6227), we noticed Mr. DuchesneDuparc's interesting pamphlet on the use of *Quercus Marina, or Fucus Vesiculosus* for the cure of obesity. The author's own observations abundantly demonstrated the innocuousness and efficacy of the

remedy, and the following letter, addressed by Dr. Godefroy to the *Revue de Thérapeutique Médico-Chirurgicale*, further confirms the results mentioned by Dr. Dupare:

"A perusal of Dr. D. Dupare's contribution in your last number, on the subject of the efficacy of fucus vesiculosus for the cure of obesity, suggested to me the idea of trying the remedy in my own case.

"I therefore procured a supply of the fucus from Saint-Malo, where it grows in abundance, and caused a hydro-alcoholic extract to be prepared; this extract is very hygrometric, and for this reason, a small number of pills only should be compounded at a time; they should be silvered over, and preserved in a large quantity of absorbing powder.

"I am fifty-seven years of age, 1 metre, 74 c. (5 feet 9 inches) in height, my bones are small, and the abdomen is in my case, the principal seat of obesity. On the 6th of March, before attempting any treatment, I weighed 76½ kilogrammes (rather more than 12 stone). From the 6th of March, I took every day, three pills, each of which contained five grains of the extract of fucus vesiculosus, the first at six in the morning, the second at ten, and the third at five in the afternoon, at the beginning of every meal, without in any other respect changing my habits.

"Under the influence of the remedy, the urinary secretion became more abundant, more highly coloured, and more odoriferous than usual.

"I again weighed myself on the 10th of April, after taking ninety pills; I had lost one kilogramme and a half, (more than three pounds) in the course of the month.

"From the 10th to the 20th of April, I took only two pills a day, one at six in the morning, the other at five in the afternoon, and then returned to three pills daily, up to May 18, when having taken a second series of ninety pills, I again weighed, (at the same hour of the day, and with the same clothes as on the former occasions), and found a further decrease of one kilogramme; from the 6th of March to the 18th of May, I therefore lost upwards of five pounds weight, without any change in my habits or diet, or having experienced any inconvenience from the use of the remedy."

ART. 6268. REMOVAL OF FOREIGN BODIES FROM THE SURFACE OF THE EYE.—The same periodical alludes to a procedure we have often seen Bérard employ with success at La Pitié, and which we have ourselves several times resorted to with advantage for the removal of foreign bodies from the surface of the eye.

Seizing the margin of the upper eye-lid at both extremities, with the finger and thumb of each hand, Bérard brought it down so as to cause it to overlap the lower lid, and thus brought the skin of the latter into contact with the mucous lining of the former. He then with one forefinger kept the eye closed, and exercised gentle friction with the other. After half a minute or a minute, the patient was allowed to open his eye, and in general the distressing sensation caused by the presence of the foreign body had entirely disappeared.

Bérard satisfied with the result, left the interpretation to others. An eminent oculist, whose death we recently recorded, Dr. Deval, remarked that he had described this procedure in his earliest publications, and explained the displacement of the foreign body, by the movements imparted to the lid, and its adhesion to the skin of the lower palpebra, to which it would remain attached while the upper lid returns to its place. Mr. Wharton Jones, whose *Practical Treatise on Diseases of the Eye* Mr. Foucher has recently translated, conceives that the lashes of the lower eye-lid act in this instance as a kind of rake.

The author of the paper inserted in the *Revue de Thérapeutique Médico-Chirurgicale* explains otherwise the dislodgment of the foreign body, and opines that the tears which accumulate in the artificially closed cavity formed between the upper lid, the eye-ball and the integument of the lower lid, detach the offending substance and carry it away, when permitted to escape.

This may happen in many instances; but we must say that in others—and we witnessed this day a case in point—the foreign body is displaced and expelled without any tears whatever escaping at the same time.

PRESCRIPTIONS AND FORMULAS.

ART. 6269. INJECTIONS APPLICABLE IN NERVOUS DEAFNESS.—Mr. Triquet cannot concede to Kramer that douches with the vapour of ether are the only remedy applicable in cases of nervous deafness. Each of the varieties of disease would, on the contrary, require a method of treatment appropriate to the known or presumed cause of cophosis.

Some forms of deafness are almost utterly incurable. For instance, the deafness consequent on convulsions, on cerebral concussion, &c.; and others either yield spontaneously, or to rational treatment directed in view of the removal of their cause. To this class belongs the deafness occasionally consequent on intermittent fever, the deafness induced by gastric disturbances, worms, rheumatism, syphilis, &c. It is not inexpedient to add, that the cophosis resulting from ague disappears spontaneously during convalescence, and that it is unnecessary to resort to the often dangerous application of electricity.

Mr. Triquet, moreover, shows by the comparison of cases borrowed from Itard, Kramer, his own experience, and hospital practice, that anatomical changes in the middle ear are by far the most common cause of what is termed nervous deafness, and that medicinal injections into the Eustachian passages are in many instances beneficial. This is the point of aural surgery which it is our present intention to allude to.

Injections of Caustic Potash.

When there is reason to believe in a granular condition of the mucous lining of the tubes or tympanum, and more especially in cases of deafness consequent on typhoid, Mr. Triquet agrees with Marc d'Espine in the propriety of injections of a solution of potash. This liquid is prepared by the addition of water to a concentrated solution of caustic potash, until it produces on the tongue only a slight sensation of tingling. With a small tube or syringe, he then takes up about fifteen drops of the diluted solution, and, after inserting into the catheter, previously placed in the Eustachian passage, the number of drops he thinks proper, forces them into the middle ear with the india-rubber blower. At first, four or five drops only are injected every other day, but the dose may be gradually increased to eight or ten. Mr. Triquet discontinues the operation as soon as mucous rhonchi become audible in the ear during insufflation. When the operation has been successful, a slight but transitory sensation of heat and tingling is experienced in the ear. If it amounts to actual pain, the injection should be performed on one ear only. When the rhonchi above alluded to are observable at once, Mr. Triquet confines himself for a week to injections of air, rendered slightly stimulating by the addition of a few drops of ether or chloroform. The number of injections required to effect a cure may vary from one to seven or eight, and more. They are entirely without danger.

Injections of Ether and Chloroform Vapour.

We have stated that injections of air, containing ether or chloroform vapour, are sometimes resorted to at the same time as the alkaline solution, for the purpose of modifying the vitality of the organs of hearing. They are also applicable to cases in which idiopathic paralysis of the auditory nerve is suspected to exist. It is especially when deafness is accompanied by tinnitus, that Mr. Triquet has found chloroform truly serviceable. Whether ether or chloroform be selected, a small quantity (from 15 drops to a teaspoonful) should be poured into an india-rubber ball supplied with a tube and cock. The heat of the hand alone is sufficient to cause volatilisation of the fluid, and by slight pressure, the vapour is readily propelled into the middle ear, through a catheter previously inserted into the Eustachian passage.

Injections of Strychnia.

If these remedies prove unavailing, strychnia, nux vomica, or veratria may be resorted to. In refractory or desperate cases, all innocuous methods may legitimately be adopted.

The following are Mr. Triquet's formulas for injections of strychnia:

No. 1. ℞ Strychniæ, gr. iij.;
Etheris acet. } ā ℥ ss.
Aq. destill. }
M. Shake the phial.

No. 2. ℞ Strychniæ, gr. v.;
Acid. acetici, ℥ vij.;
Aq. destill. ℥ss.

The solution must be perfectly transparent, and three or four drops should be injected into each Eustachian tube. With the first mixture $\frac{1}{15}$ of a grain will thus be thrown into each ear, and about $\frac{1}{7}$ of a grain with the second.

In one out of twelve cases this remedy was of eminent service.

Mr. Triquet has also tested, with negative results, the utility of the tincture and extract of nux vomica. But no bad effects were ever induced by these, or by the solution of strychnia.

Injections of Veratria.

No. 1. Aquæ, ℥iv.;
Veratriæ, gr. xij.;
Acid. acet., ℥ xij.

This preparation must always be diluted with four, five, or six times its volume of water. It is a painful local irritant.

No. 2. ℞ Alcohol, ℥j.;
Veratriæ, gr. iij.

This solution, before being used, should be diluted with from 2 to 24 volumes of water.

Veratria is excessively irritant, and it is necessary to begin with very diluted solutions. The smallest dose ever used by Mr. Triquet was $\frac{1}{1\,1\,7}$ part of a grain dissolved in two drops of water. A trifling sensation of pain followed this very minute quantity.

The largest amount injected was $\frac{1}{7}$ of a grain in three drops of alcohol and water. The effect was extremely violent, and the pain in the ear excruciating. It was allayed by injections of water; but, after the seventh insufflation, sufficient relief was experienced to justify further experiment with this medicinal agent.

Art. 6270. Pomade with the Extract of Logwood, for the Disinfection of Gangrenous, or Putrid Sores.—Dr. T. P. Desmartis recently communicated to the Academy of Sciences a short account of the antiseptic properties of the extract of logwood (hæmatoxylum toxicodendron), an inexpensive substance, chiefly used by dyers.

The author states, that in several cases of most offensive cancerous sores of considerable extent, it occurred to him to use as an astringent the following pomade:

℞ Extracti hæmatoxyli; } āā ℥ij.
Adipis, }

The effect of this application was at once to purify the ulcers and to check the discharge. Having discontinued the ointment for a few hours only, the offensive emanations and puriform secretions almost immediately reappeared.

According to Dr. Desmartis, hospital gangrene and other forms of mortification receive astonishing benefit from applications of hæmatoxylum, and he believes that it will also be found efficacious in the formidable erysipelas consequent on surgical operations.

This extract, which, it is true, is soluble only in hot water, can easily be mixed with hæmostatic substances—such, for instance, as infusion of fir-buds, ergotine, sesqui-chloride of iron, &c. It may also, according to Mr. Desmartis, be used in powder or lotions, according to the requirements of each case.

Art. 6271. Decayed Teeth. Creosote and Collodion Filling.—The *Répertoire de Pharmacie* recommends the following as an appropriate filling for the excavations of decayed teeth:

℞ Creosotæ, ℥ ss.;
Collodion, ℥ij.

This mixture is of the consistency of jelly, and can be inserted readily into the teeth. It presents none of the disadvantages reproached with some truth to undiluted creosote.

The Medical Circular.

REVIEW OF THE PERIODICALS.

The 'Medical Times and Gazette.' Professor Gulliver's Lectures on the *Blood of the Vertebrata* are continued in this number. The form, size, and specific gravity of the red corpuscles constitute the subject of the Lecture.

The 'Lancet.' Dr. Thomas K. Chambers contributes a Clinical Lecture on the *Treatment of Pneumonia*. The remarks are applicable to three cases.

"No. 1. Frank, uncomplicated, double pneumonia, in a temperate, robust man; excessive dyspnœa. Cured by venesection, jacket poultice, food every two hours, and wine.—No. 2. Pneumonia of upper and lower lobes of right lung, very slight in left lung, in a broken-down old man. Cured by cupping in front, jacket poultice, food every two hours, and wine.—No. 3. Congestive pneumonia of one lower lobe in typh fever. Cured by half-jacket poultice, cupping below scapula, food every two hours, wine and bark."

We extract the following remarks on bloodletting:

"The beneficial action of bloodletting in pneumonia is mechanical. It is more a question of hydrostatics than of physiology. The pathology of pneumonia is as follows:—By the temporary death of a portion of the lungs, the blood cannot be quickly enough passed onwards through their tissue; it can run freely as far as the right side of the heart, but there it is stopped; the throng pressing onwards from behind makes matters worse, and thus the balance between the venous and arterial heart is destroyed. You can feel the apex of the organ beating strongly against the ribs, the muscular action being excited by the presence of an unusual amount of venous blood; yet the artery at the wrist is at the same time striking your finger with an imperfect, weakened force.

"Take away some of the blood from the veins, and the balance is restored—the pulse becomes 'freer,' as the technical phrase is; that is to say, the heart being relieved of the undue crowd in the right side, is not arrested in its contraction, but is able to close upon its contents, and supply them steadily to the arteries.

"The advantage of general and local bloodletting is of identically the same nature, though they differ somewhat in degree, and are diversely applicable. Where the patient was, previous to his current illness, in vigorous health, actively digesting his food, and actively renewing his tissues, he will bear, and easily repair, the detraction of a good large quantity of blood; and a good large quantity of blood is most conveniently drawn from the arm. To get, therefore, the full advantage of the remedy, and be on the safe side, you should practice venesection. But if the pneumonia has come on a person previously an invalid, or in weak health, you fear for the possible bad consequences of your treatment, and you cast about for some means of getting the greatest advantage out of the least loss of blood. This is obtained by cupping the region of the heart. Your six or seven ounces taken from thence, in a delicate invalid, seem to produce a corresponding effect to twelve or fourteen let from a vigorous man's arm. But there are practical inconveniences in cupping to a large amount in this situation. You are obliged to cut deep to obtain a good flow, and deep cuts cannot be stopped easily, but go on oozing unperceived into the poultice which, as I will instruct you presently, is to be put round the chest.

"Remember that in letting blood you are wielding a dangerous weapon. While from a mechanical point of view nothing can equal the aid it gives, at the same time its more remote or physiological action is hurtful. The shrewd comedian tells us, 'necesse est facere sumptum, si quæris lucrum;" so that if you have gained the inestimable boon of a restoration of balance in the circulation, and a consequent relief of dyspnœa and an arrest of the progress of death in the lungs, you must not complain if some evils attend the process. The mere loss of so much 'liquid flesh' is in itself an evil, but a minor one; of greater import is the increased proportion of effete fibrin and water which it induces, the diminution of red globules, and the consequently diminished power to bear up against the destruction, however temporary, of so much pulmonary substance.

"Judge, therefore, of the necessity for this treatment by the balance between the heart and the arteries. If the apex of the former organ strikes strong while the pulse at the wrist is defective, act freely and confidently. If, on the contrary, the ventricles are weak while the pulse is full, large, and rapping, be cautious in what you do, and if you draw blood at all, let it be by cupping the chest."

Again, with respect to the jacket poultices:

"I now come to a direct restorative, about the use of which at all

times you need have no manner of hesitation. You can always, without any exception of age, sex, condition, cause, or complication, follow a treatment to which I attribute more power of saving the lives of pneumonic patients than to any other, and which you see me apply in all cases; I mean, the enveloping the chest in a large bath-like poultice. The action of warmth and moisture on animal tissues tends directly to increase their vitality. You may *see* with the naked eye a healthy surface of skin under their application renew its life; it empties itself quicker of its pale, livid, venous blood, and glows with a fresh access of the bright arterial stream; it swells up elastically with fresh juices; it is more delicately sensitive when used for the purposes of touch; at the same time it feels no pain, but, on the contrary, an exquisitely pleasurable calm. You cannot see this renewal of life in internal organs; but you may infer that what takes place in one tissue takes place also in another with modifications dependent on distance and other difficulties of application. And you may infer it also from the results; for you find the dyspnœa diminished, the breath being easier drawn in spite of the weight of the poultice; the hot, fevered skin becomes moist and active, and soon the ribs begin to move again, and air is re-admitted into the previously paralysed lung-tissue. These effects are the most strikingly shown in the case of infants, whose thin chest-walls are rapidly and efficiently permeated by the influences of the poultice, and in whom also this remedy is the only one really safe and invariably necessary. I cannot speak too strongly of the importance of your adopting it, and letting all other treatment be rather rejected than this directly restorative agent.

"The poultice is best made of bruised meal, because that keeps moistest. It should be spread half-an-inch thick at least, on a cloth or flannel, as broad as the circumference of the thorax. If any portion of the upper lobes is inflamed it is essential, and even if only the lower lobes are inflamed it is prudent, that it should be deep enough to cover the whole chest from the collar bones to the hypochondria. Lay the patient on it on his back, and fold it across the front until it meets. In adults it will usually keep in its place of its own accord; but in children it is useful to have a tape stitched on in front and a tape behind, which you tie over each shoulded in the manner of a shoulder-strap, otherwise the little prisoners wriggle out of their soft breastplates. When once you have got it *in situ*, keep it there, and desire the nurse, on pain of dismissal, never to take it off till another hot one is ready to go on."

Dr. Chambers recommends a moderate use of alcohol—negus, for example—and objects to purgatives, and to antimony and mercury, as destructive agents. Mr. HUGMAN'S article on the *Mechanical Treatment of Disease* shows the importance of extension in hip-joint disease. He says:

"Examination of the hip-joint showed, by measurement from anterior superior spine of the ilium to the upper margin of the patella, a shortening of an inch and a half; the nates being much flattened, and the whole limb smaller than the unaffected one. There was no indication of abscess around the joint. On attempting to flex the thigh, the pelvis rotated with it to some extent; but there was evidently motion, although very restricted, at the hip-joint, notwithstanding the long duration of the disease.

"I entertained but very slight hopes of benefiting such a case, and gave my opinion accordingly; but as she was to remain in London two or three months, I was desirous of making the attempt. She was placed on the apparatus known as the prone couch, and soon became accustomed to the change of position, experiencing comfort from the removal of all pressure upon the affected hip. I commenced making extension by means of a strap round the ankle, to which a weight of seven pounds was attached. At the end of a week no appreciable effect was produced beyond a slight appearance of elongation, owing to the removal of the pelvic obliquity. The measurement from the ileum to the patella showed no alteration. The weight was increased to fifteen pounds, and afterwards to twenty pounds. No inconvenience was experienced from this treatment beyond a slight continued pain at the hip-joint, and stiffness of the limb caused by the traction made upon it. She lay amusing herself with reading and embroidery work, which is the great advantage the prone couch affords, allowing as it does the free use of the arms. When I visited her on the twenty-eighth day of this treatment, I found that about an hour before my arrival the limb had suddenly elongated to the full extent; the ankles were perfectly parallel to each other. She was suffering much pain, and had of her own accord removed the weight. When she touched the ground with her toe it produced exquisite pain of the hip. A gutta-percha shield was then moulded to the part, and kept closely applied by means of straps. The prone position was maintained almost constantly for two months, after which she was allowed to walk with the support of her crutches; but for six months a very moderate amount of walking exercise was permitted. She has now perfectly recovered the use of her limb, and no subsequent contraction has taken place. A slight halt in the walk is all that remains.

"I am perfectly at a loss to account for the *sudden* lengthening of the affected limb in this case. The measurements, as given above, would imply either that the head of the femur had actually escaped from the acetabulum, or that the upper margin of the cavity had become so much absorbed that, together with the loss by ulceration of the inter-articular cartilages, the shortening was the result of muscular contraction. Had no measurements been taken, one would have been disposed to consider it an hysterical affection; but, under any circumstances, I think it a case well worthy of record."

THE NEW LICENCE OF THE COLLEGE OF PHYSICIANS OF LONDON.

The following are the regulations for the new class of Licentiates of the College of Physicians, according to the bye-laws passed this week:—

"The College will, under its charter, grant licenses (which are not to extend to make the Licentiates Members of the Corporation) to persons who shall conform to the following bye-laws:—

"1. Every candidate for the College licence (except in cases specially exempted) is required to produce satisfactory evidence to the following effect:—Of having attained the age of twenty-one years. Of moral character. Of having passed a preliminary examination in the subjects of general education. Of having been registered as a medical student by one of the bodies named in Schedule A of the Medical Act. Of having been engaged in professional studies during four years, of which at least three years shall have been passed at a recognised medical school or schools, and of having attended the medical practice at a recognised hospital or hospitals, during two years of that period; *and the surgical practice during twelve months;* and of having been engaged during six months in the clinical study of diseases peculiar to women. (The last of the four years of professional study must he passed at a medical school, hospital, infirmary, or dispensary recognised by the College.) Of having studied the following subjects:—Anatomy, with dissections, two winter sessions of six months each. Physiology, two winter sessions of six months each. Chemistry, six months. Practical Chemistry, three months. Materia Medica, three months. Practical Pharmacy, three months. (By Practical Pharmacy is meant instruction in the laboratory of a registered medical practitioner, or of a member of the Pharmaceutical Society of Great Britain, or of a chemist and druggist recognised by the College on special application, or of a public hospital or dispensary recognised by the College.) Botany, three months. *Morbid Anatomy, six months;* (or certified attendance in the post-mortem room during the period of clinical study.) Principles and Practice of Medicine, two winter sessions of six months each. (It is desired that the study of the Principles and Practice of Medicine should comprise the study of the Principles of Public Health.) *Principles and Practice of Surgery, six months.* Clinical Medicine, one winter session and one summer session, or nine months. *Clinical Surgery, six months.* (By Clinical Medicine and Clinical Surgery are intended lectures on cases under observation, or special instruction at the bedside, certified by the teacher.) Midwifery and the Diseases peculiar to Women, three months. (A certificate must also be produced of having attended not less than twenty labours.) Forensic Medicine, three months. Of having passed the professional examinations.

"2. Any candidate who shall fail to pass either of these examinations shall not be re-admitted to examination until after the lapse of six months.

3. "Any candidate being a 'registered medical practitioner,' whose qualification or qualifications shall have been obtained before January 1st, 1861, having been, with the consent of the College, admitted a candidate for the licence, will be examined on the Principles and practice of Medicine, Surgery, and Midwifery, but he will be exempted from such other parts of the professional examinations as his qualifications may seem to the Examiners to render in his case unnecessary.

"4. Any candidate who has already obtained the degree of Doctor or Bachelor of Medicine at a Universfty, approved and recognised by the College, after a course of study and an examination satisfactory to the College, shall be exempt from the first part of the professional examination for the licence.

"5. Any candidate who has already obtained the licence of the Royal College of Physicians of Edinburgh, or of the King and Queen's College of Physicians in Ireland, after a course of study and an examination satisfactory to the Examiners appointed by the College, shall be exempt from the first part of the professional examination for the licence.

"6. Each Licentiate shall have the following form of licence given to him, under the seal of the Corporation, signed by the President and by the Examiners:—'I, A. B., President of the Royal College of Physicians of London, with the consent of the

Fellows of the same College, have under the authority given to us by Royal Charter and Act of Parliament, granted to C. D., who has satisfied the College of his proficiency in the science and practice of Medicine, Surgery, and Midwifery, our licence under the said Charter, to practise Physic, so long as he shall continue to obey the statutes, bye-laws, and regulations of the College relating to Licentiates: in witness whereof we have this day set our seal and signatures. Dated at the College, the day in the year of our Lord .'

Signed _____ *President.*

_____ } *Examiners.*

"N.B.—This document shall be signed by the Licentiate with his usual signature, and by the Registrar, with the following words: 'I certify that C. D., to whom this licence has been granted by the College, and whose signature is subjoined, has been duly admitted to practise Physic as a Licentiate of the College.'

_____ *Registrar.*

_____ *Licentiate.*

"7. Licentiates of this College shall not compound or dispense medicines except for patients under their own care."

THIRTIETH ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION.

(Continued from page 121.)

FRIDAY, AUGUST 8.

The members having assembled, the following report of the committee appointed to consider the matters in dispute between Mr. Webber and Mr. Spencer Wells was read:—

"At a meeting of the committee, consisting of Dr. Westall, Mr. Bottomley, and Mr. [illegible] committee, charge made by Mr. Heckstall Smith, appointed to inquire into a professional misconduct by Mr. Webber against Mr. Spencer Wells, of professional misconduct, the notice required by Law 17 having been read, together with the resolutions by which the committee was constituted and its duties were defined, it was agreed, after careful investigation, and a personal interview with Mr. Webber,

"'That this committee is of opinion that no evidence has been laid before them of any professional misconduct on the part of Mr. Wells.'

"Signed on behalf of the committee,

"EDWARD WESTALL, Chairman."

REPORT OF THE COMMITTEE ON THE ACTION OF MEDICINES.

Dr. HUGHES BENNETT read the following report:—

"A meeting of the committee appointed to consider Dr. Handfield Jones's proposal for an inquiry into the action of medicines, was held August 7, 1862.

"Present:—Dr. Hughes Bennett (chairman), Dr. Harley, Dr. Fleming, Dr. Handfield Jones, Dr. Farr, Mr. Crompton, Mr. Hodson, Dr. Webster.

"The committee, after careful consideration, have agreed to propose to the Association the following plan for carrying out investigations as to the action of remedies. They recommend that six separate subjects be proposed to the members or other practitioners for inquiry during the first year, viz.:—

"1. The effects of antimony, moderate blood-letting, supporting diet, or stimulants, in pneumonia.

"2. The effect of the oil of the male fern, or of kousso, in tænia.

"3. That of arsenic, moist weak alkaline applications, or pitch ointment, in psoriasis.

"4. That of mercurials, benzoic acid, and podophyllon, in jaundice.

"5. That of chlorine mixture, carbonate of ammonia, quinine, and the wet sheet, in scarlatina.

"6. That of atropia in epilepsy.

"7. As it is admitted that much of the uncertainty of the action of remedies is dependant on our ignorance of the progress of disease, it is proposed that a schedule for each subject should be drawn up, containing the age, sex, and other points requiring attention, so that the information given may be presented in a convenient form. These will be prepared, each by a different member of the committee, who will take charge of a single subject; viz., prepare a schedule, arrange for its distribution to all the Associates along the Journal, write an article in the accompanying number, directing attention to certain important points, receive the returns, and draw up a report to be presented to the next meeting of the Association. These labours have been undertaken by the following gentlemen:—Dr. Bennet for pneumonia, Dr. Harley for jaundice, Dr. H. Jones for psoriasis, Dr. Fleming for tænia, Mr. Crompton for atropia in epilepsy, Mr. Hodson for scarlatina, and Dr. Farr for the progress of disease.

"The committee would gladly advise, also, the selection of a subject for careful scientific investigation, provided it appear to the Association, that a moderate sum, say 30*l.*, can be raised to defray the necessary expenses. One which they may mention is the physiological and therapeutical action of mercury.

"Some small expense may be incurred in the preparation and transmission of these schedules; but they believe the Association will feel with them that the object they have in view is well worth, and will well repay, the efforts requisite for its attainment.

"Signed on behalf of the committee,

"J. HUGHES BENNETT, Chairman."

It was proposed by Dr. RADCLYFFE HALL, and seconded by Dr. A. T. H. WATERS (Liverpool)—

"That the report be received and its recommendations be adopted."

The resolution was adopted, the question of raising the necessary funds being left to the Committee of Council.

Dr. HUGHES BENNETT then read a paper

ON THE TREATMENT OF PNEUMONIA, WITH AN ANALYSIS OF ONE HUNDRED AND FIVE CAREFULLY RECORDED CASES.

The following is the abstract of this paper:—The author said that eighteen years ago, after having made researches into the pathology of inflammation, he was induced to doubt the correctness of the antiphlogistic method of treatment. He considered that the removal of blood could not alter the organic changes in the lungs, and that the strong pulse and fever which were generally considered as symptoms justifying blood-letting, were evidences of Nature's efforts at repair. Instead of antiphlogistic treatment, these efforts should be supported, not necessarily by stimulation, but by nutrients, and also by attending to many circumstances in the progress of the cases. For fourteen years he had been guided by these views, and he had since seen them adopted by the profession. When the antiphlogistic treatment of pneumonia was in vogue, the disease was very fatal. Andral said that experience showed that we should be very prodigal of blood in all cases of pneumonia; yet of sixty-five of his cases one-half died. In the five years 1832 to 1837, one-third of the cases of pneumonia treated in the Edinburgh Royal Infirmary died. The practice of M. Louis, in the Hotel Dieu, was equally unsuccessful. The author's practice had been to support the strength of the patient, and when depletion was practised it was to palliate dyspnœa, and not with the view of reducing the force of the circulation. During the febrile exacerbation, mild salines were administered. After the fourth or fifth day nutrients, as beef-tea, were given; and, on the pulse becoming weak and soft, from four to eight ounces of wine daily. At the period of the crisis, mild diuretics were had recourse to. Of the 105 cases of pneumonia in adults 3 died—the average rate of deaths, therefore, being 1 in 35. The average age of the patients was 31⅞ years. The number of uncomplicated cases in which one lung only was affected was 58, and the average duration of the disease in them was 13½ days. There were 19 cases in which both lungs were affected; average duration, 20 days. Seventeen cases in which the disease was complicated; duration 15½ days. There were 8 cases in which it was impossible to ascertain the duration. The average residence in the hospital, of all the cases, was 77 days; but in the uncomplicated cases it was only 22⅝ days. In many of the cases the residence in the hospital was prolonged from various accidental circumstances. In the three cases of death the author said there were in each severe complications—in one there was ulceration of the stomach; in another, Bright's disease; and the third was a drunkard. As these cases were all that had come under his care, it might be supposed, he said, that the disease was rare in Edinburgh. The small number was accounted for by this—that he only took charge of the clinical wards during one-half or one-third of the year. Again, it might be said that the cases were slight and trivial. They were not so; many were very severe. He considered that in cases of pneumonia, as in other inflammations, the cause of death was generally exhaustion. He did not consider that the greater frequency of recoveries was due to change of type in disease, or to any other special cause. He attributed it solely to the advance of Medical science.

An interesting discussion took place after the reading of this paper, and the general testimony was that Dr. Bennett's was the most successful series of cases that had ever been reported.

GLAUCOMATUS AFFECTIONS AND THEIR TREATMENT BY IRIDECTOMY.

The following is a brief abstract:—The author first spoke of the great advance in our knowledge of diseases of the eye since the discovery of the ophthalmoscope by Helmholtz. It had, he said, effected a total revolution in ophthalmic practice. A glaring example was to be found in glaucoma. Glaucoma was an old name, but our knowledge of the disease was quite recent. A disease which was once quite hopeless, was now often quickly cured, or its progress checked by iridectomy. Since 1856, when Graefe, who introduced the operation, published his researches, the operation had been fre-

quently performed by Donders, Arlt, and many other ophthalmic surgeons. In May, 1851, the author first performed the operation, and had since tested it on a large scale both at Moorfields and in private practice. In a paper read before the Medico-Chirurgical Society by Mr. Hulke, in 1858, its adoption in glaucoma was urged on the Profession. In the year 1859 the New Sydenham Society published Graefe's papers on 'Glaucoma and Iridectomy. In August, 1860, he (the author) wrote a letter in the 'Medical Times and Gazette,' in reply to certain objections urged against the operation by the Irish ophthalmic surgeons. The progress of truth was, he said, necessarily slow, and many ophthalmic surgeons had either not made themselves acquainted with the recent improvements in the treatment of glaucoma by iridectomy, or they rejected the operation altogether. Hence, from hearing many and contrary opinions, practitioners lose time in applying the remedy until it is too late. The special symptom in glaucoma, which is definite and easily appreciated, and which calls for operative interference, is tension of the globe. In chronic glaucoma there is more difficulty in estimating this, as then the tension is slight and variable, or the tissues have been gradually accommodated to it, yet the optic nerve gradually atrophies from pressure. In cases of acute glaucoma, the operation ought to be performed at once, without any hesitation, as every hour is precious. In these cases puncture has been practised, but the relief is only temporary, and relapses occur. No abatement of the symptoms should lead to the abandonment of the operation. Nor should we lose time by applications to the eye or by courses of mercury, or by colchicum, or by attending to supposed disorder of the stomach, or to gout. These remedies really do no good. The author next dwelt on the various complications of glaucoma by hæmorrhage and by cataract. In case of cataract with glaucoma, he said we ought to perform iridectomy first, and at a second operation remove the cataract. He believed that glaucoma occurred in certain states depending on disorder of the nerves of the blood-vessels of the eye, and that it was not connected with gout or any similar general constitutional condition.

A paper, by Dr. Cutter, was then read on

THE TREATMENT OF MORBUS COXARIUS BY EXTENSION-SPLINTS.

Dr. Cutter briefly mentioned some features in the American methods of extension in morbus Coxarius, embracing splints of cylindrical and hemicylindrical metal attached to the limb by strips of adhesive plaster, and to the perineum by straps of elastic and inelastic bands, or by a band composed of india-rubber tubing. They had the advantage of simplicity, effectiveness, of obviating to a great extent shortening and pain, besides allowing the patient to be peristaltic. At night, extension by pulley and weight connected to the adhesive strips.

ADDRESS IN PHYSIOLOGY.

BY W. SHARPEY, M.D.

Mr. President and Gentlemen,—When I undertook the honourable but anxious task of delivering an address on Physiology to this important assembly of the Medical Profession, I thought it would best suit the occasion were I to pass in review some of the leading features and incidents which have marked the progress of the science during the time this Association has flourished—a period most eventful in the history of modern physiology.

The last quarter of a century, however, has been so prolific of scientific inquiry, and so fruitful in discovery, that it would be futile in me to attempt anything in the nature of a connected history or systematic exposition of the subject before us. I can only endeavour, out of the wide range of topics which present themselves, to select such as seem best adapted to characterise the scope and aspect of recent physiology, and more especially to illustrate improvements in method, extension of acquired knowledge, and revolutions in doctrine. I could have wished to present a view of these subjects in special relation to Medicine, but this I must leave to a future occasion, and to some more able expositor.

In contemplating the operations of the animal economy, the mind is naturally first drawn to the evidence, everywhere manifest, of purpose and contrivance, of ends to be compassed and means provided for their fulfilment. It is, accordingly, no wonder that ever since the time of Galen's famous treatise '*De Usu Partium*,' the uses or functions of the organs of the animal frame should have formed a main subject of study and reflection; and, as you well know, it is a part of physiological study by no means yet exhausted. But intelligent inquirers soon also took up the investigation of the processes of the animal system with a view to their rational explanation. Phenomena were scrutinised, as to the condition of their occurrence, their succession, and mutual dependence; they were referred to the operation of certain general properties and peculiar forces, recognised as belonging to the living body, and efforts were made to find out general laws to which the individual facts might be subordinated.

These labours have been crowned with no small measure of success, and, thanks to the advanced state and happy application of the collateral sciences, many phenomena of a purely physical or chemical nature have been satisfactorily referred to their true causes. If problems yet remain (and there are many such) which have baffled all attempts at physical explanation, it must at least be counted as no small gain that we no longer seek their solution in the agency of imaginary entities, clothed with mystical attributes, like the Archæus of Van Helmont, the Anima of Stahl, and the Vital Principle of later theorists, nor vainly strive to square them to the dogmas of some dominant vito-chemical or dynamical system.

CAUSES OF THE ADVANCE OF PHYSIOLOGY.

During the period which we propose to keep in view, physiology has undoubtedly advanced with accelerated pace; and, among the causes of this advancement, a foremost place must be assigned to the increased number and activity of its cultivators. This is to be ascribed, I believe, in some considerable measure, to the establishment of schools of Practical Physiology in various parts of Europe. Opportunities for the practical pursuit of Anatomy have long been deemed an indispensable requisite for that study. Chemical laboratories, where young men are trained to chemical research, have powerfully contributed to promote the science of Chemistry. To these are now added, in various schools on the Continent, and especially in Germany and Holland, physiological laboratories, in which opportunities are offered for the practical study of structural anatomy, physiological chemistry, and experimental physiology. In these establishments, encouragement is given and facilities afforded for original research; and all the requisite arrangements, with the best instrumental appliances, are provided for that purpose. Accordingly, many valuable physiological memoirs have emanated from the practical schools of Berlin, Dorpat, Würzburg, Utrecht, and elsewhere; and accomplished young professors and assistants have been supplied to the various German Universities, there to carry on their independent researches.

The practical schools of chemistry in this country have taken an honourable place in the advancement of their science. Physiology, it is true, holds out no material rewards to her votaries; let us hope, nevertheless, that there will not be wanting young and ardent aspirants, in adequate numbers, who, through their devotion to science and desire of honourable distinction, may place modern British physiology in the same worthy position.

Much may reasonably be expected from the position which physiology has now taken as a branch of general education. For more than twenty years animal physiology has, to a certain extent, entered into the examinations for degrees in Arts at the University of London, and is now carried to a much higher pitch in the Science degree, recently instituted by that body, and already showing promise of great good. The older Universities have followed in the same line; and in Oxford, a Chair of Physiology has been liberally endowed, and all requisite advantages afforded for study, both general and practical; and we may confidently anticipate that, under the guidance of the accomplished and energetic Professor, who has already begun his labours, the ingenuous youth who resort to that great seat of learning, untrammelled by the calls of Professional study, will powerfully aid in the advancement of the science.

The elementary truths of physiology are now also becoming a subject of instruction in ordinary schoools; and in the general spread of the knowledge of the living economy, good seed may here and there fall on fertile ground, and yield a return in kind. The more general diffusion of this species of knowledge, moreover, although not intended to instruct mankind in the cure of disease, may teach them to shun its avoidable causes; above all, such knowledge is well calculated—as we know it is sorely needed—to save men, even of high intellectual and social position, from becoming the victims of illusion, or the dupes of imposture.

EXPERIMENTS ON LIVING ANIMALS.

As I have spoken in commendation of experiment, I cannot avoid digressing for a moment to say a few words on the indignant but misdirected declamation in which many well-meaning persons permit themselves to indulge against experiments on animals, which they indiscriminately denounce under the opprobrious name of "vivisections." This is a matter which not only touches the character for humanity of physiologists, but concerns our common Profession. It is a subject on which I have reflected much in the course of my life, soberly, I trust, and impartially, apart from Professional predilection, and with due regard to extra-Professional sentiment; and I trust this will not be deemed an unfitting occasion for expressing an opinion.

Experiments on brute animals have been stigmatised as cruel, barbarous, and inhuman in themselves, and calculated to blunt the feelings and roughen the nature of those who engage in or witness them. Cruelty, I may remark, is defined by our greatest authority on the meaning of words to be "delight in the pain or misery of others," also "an act of intentional affliction." But let us not take shelter under a definition. Let us affirm unreservedly that the sacrifice of animal life, or the infliction of pain, unless with a view to some commensurately useful result, is utterly indefensible.

Tried by this test, I believe the great majority of experimenters will be pronounced free from just censure. Attention has, it is true, been lately directed to proceedings carried on in some foreign

(Continued at page 137.)

THE MEDICAL CIRCULAR.

WEDNESDAY, AUGUST 20, 1862.

MR. LAWRENCE IN A COURT OF LAW.

Another painful case exhibiting the contradictions of Medical evidence in Courts of Law has lately transpired. We advert to it with unfeigned sorrow, not unmixed with a sense of shame, that the character of the Profession should have been lowered by the misbehaviour of those who are understood to represent its moral sense and intellectual status. Having firmly resolved to check the pernicious custom of eminent practitioners going into Courts of Law as "authorities" to pronounce an opinion upon cases with which they have no legitimate professional connection, we cannot with any propriety or consistency overlook the absurd and derogatory position occupied by Mr. Lawrence in the course of a recent trial.

The action was simply one for damages to compensate the plaintiff for an injury to the spine, said to have been caused by a Railway collision. On the side of the plaintiff were Dr. Burrows, of Brighton, Mr. Marshall of University College Hospital, Dr. Brown-Séquard and others. On the side of the Company were Dr. Hall, its officer, Mr. Adams, Mr. Skey, and Mr. Lawrence, some of whom had not even seen the patient. The former gentlemen contended on the part of the plaintiff that there was serious injury of the spine, from which he would be a long time recovering; and that, moreover, there was a swelling in the back which was gradually growing larger, and the nature of which it was difficult at present to determine. On the other hand, Dr. Hall did not think there was much the matter; but it was possible that there might be, as spinal injuries were sometimes very obscure—a characteristic of his own evidence. Mr. Skey considered that the symptoms were due to hysteria rather than to actual injury. It is not improbable that if Mr. Skey had been cross-examined he would have given cogent reasons in favour of his opinion, but, unfortunately for him, the evidence of Mr. Lawrence was made to supply the place of such cross-examination, and the consequence was, that he not only controverted Mr. Skey's views, but also made himself very ridiculous. Mr. Lawrence had never seen the patient, and absolutely knew nothing more of the case, than he could dovetail together from the fragments of evidence as it transpired in court. Now we cannot understand how any man, knowing the illusory character of mere verbal description, and the importance of a visual and tactual examination of every patient, in order to the formation of a correct opinion of a case, and having, at the same time, a due sense of self-respect, and a proper regard for the honour of his Profession, could consent to go into a Court of Law to pronounce an opinion upon such verbal statements as might then be elicited by rival barristers, whose business is to mystify, rather than to make plain, to pervert, suppress, and torture the facts. Mr. Lawrence had no excuse for entering the witness-box. His conduct, as a scientific man, deserves nothing but animadversion. It was indiscreet and derogatory. He was made to look ridiculous by Mr. Sergeant Shee, was virtually reprimanded by the Judge, and incurred the derisive censures of the audience.

The evidence given by Mr. Lawrence was the most self-destroying that we have ever read. He denied that there was any "concussion," but he admitted that there was a "shake" of the spine, and as he could not define the difference between a "concussion" and a "shake," he was compelled to suffer the embarrassment and confusion of his error. He then questioned the facts, as stated on oath by the other witnesses, for which he was duly called to order by the Judge; but what else could the witness do when he found that his opinions would not square with the facts; unless, indeed, he abandoned his opinions, which was a conclusion that could not be expected. He rejected alike the pathology of Mr. Marshall, his opponent, and the symptomatology of Mr. Skey, his ally, and ended with confounding and confuting himself. What more can we say? We do not remember another so painful an exhibition in any Court.

The public are becoming sensible of the impropriety of rival Medical witnesses in Courts of Law, and, if we mistake not, Counsel themselves are coming to a determination to apply a corrective to so mischievous a practice. We have no doubt that the abuse will be speedily cured. One or two more such examples, and leading surgeons will be deterred from risking the sarcasms of opposing Counsel.

We are afraid that certain "authorities" allow themselves to be subpœnaed on any occasion when a mere opinion is wanted, and that they are quite indifferent as to their possession of any previous knowledge of the case. We are unable to comprehend this facility. We can understand that a large bribe from a railway company would be a temptation to an avaricious or needy man, but that Mr. Lawrence, an "ex-President of the College of Surgeons," a chief Surgeon to a great London Hospital, and now so old as to be above the storm and the hazards of life, should risk his reputation by descending to so censurable a practice, is an enigma that others more intimate than we are with Mr. Lawrence alone can solve. The event is much to be deplored; and yet, if it should be followed by the advantage of an effectual arrest of the pernicious practice we have been condemning, we shall not altogether regret that the penalty that purchased the boon, was suffered in the person of so distinguished a man as Mr. Lawrence.

THE IRISH SECRETARY AND THE BELFAST ASYLUM.

Sir Robert Peel has an unhappy facility at blundering. His incautiousness has led him, during his Irish secretaryship, into all sorts of scrapes, from which neither his dash nor pluck have extricated him with credit. For his father's sake his mistakes have been condoned; the nation, moreover, is unwilling to see a great historic name shaded with an ill-repute. But Sir Robert must take more care, or we shall have to draw distinctions between the great Sir Robert and the little Sir Robert, that may be more true than flattering.

A Report of the Belfast District Hospital for the Insane Poor has lately come to hand, and we observe in it a series of documents relating to the management of the Asylum, which require more than a passing notice. These documents commence with a letter from Mr. Corbet, Chief Clerk of the Lunacy Commissioners, accompanying a "Memorandum" from Sir Robert Peel, of which the following is a copy:

"'THE INSPECTORS OF LUNATIC ASYLUMS.

"'How was it that yesterday both the Manager and Matron of the Belfast Asylum were absent at one and the same time from their duties?

"'Is not this a fit subject for inquiry?

"'Again, can it be the case that the attendants in the Belfast Asylum carry clubs when accompanying visitors through the wards?

"'Has there ever been an instance of the use of their clubs on the part of the attendants towards the patients?

"'Pray make these inquiries of the Board, and report immediately. "'(Signed) "'ROBERT PEEL.

"'October 26th, 1851.

"'P.S.—I am told that yesterday, in the absence of the Manager and Matron, the condition of the house was anything but cleanly, although it has got the character of being a well-conducted establishment. "'(Signed) "'R. P.'"

The form of this Memorandum is very remarkable. No allegation is made, but questions are put implying charges of a most serious character. This mode of inculpating a public officer was unfair and unbecoming. Then Sir Robert says: "I am told that yesterday, &c.;" who told him? We can hardly believe that any man reputed to have sufficient common sense to hold a high and influential public office could listen to the tell-tale whisperings of private gossips, and found thereon a grave charge against an educated gentlemen and old public servant.

This memorandum was of course brought under the notice of the Board of Governors, who met without delay and investigated the implied charges, and the result of their inquiry was, that all of them were found to be groundless. With regard to the absence of the Manager and Matron, it is explained that the Matron was labouring under dangerous illness, and was gone to her daughter's home to recruit her health, by advice of her Medical attendants; whilst Dr. Stewart, the Manager, was absent for a short time on the business of the Asylum. The second charge about patients' carrying clubs, is directly contradicted, and is described as "*entirely unfounded* in both its parts." The third charge of *uncleanliness* is as satisfactorily disposed of. The reply of the Board to the memorandum is conceived in a tone of reproof, and is written with much force and dignity. We are pleased to cull from it the following testimony to the high character and long and valuable services of Dr. and Mrs. Stewart:—

"You, Gentlemen, are well aware of the merited and grateful esteem in which we have hitherto considered ourselves entitled to hold our estimable "Manager and Matron;" but you know, likewise, the untiring zeal and liberality with which we have laboured to secure the comfort and welfare of the unhappy beings entrusted to our care, and assuredly we shall never attempt to screen even our hitherto most trusted officers should it be *proved* that they have failed, in any way, to discharge their important duties. On the other hand, if *they* should be able to prove, as we feel confident they will, that they have been uniformly faithful, humane, and efficient public servants in a most arduous trust, we shall never desert them."

After receiving this answer, Sir Robert Peel himself visited the Asylum, and wrote the annexed "Remarks" in the Visitors' Book:—

"'I have this day visited this Institution, but it is difficult to judge of its general cleanliness, on ordinary occasions, from the fact the wards and every part of the corridors having just been thoroughly washed, the beds arranged with clean linen, &c., &c.

"'This is the first Institution of the many I have visited in which the Matron of the Establishment did not accompany a party of visitors through the female wards. The prejudicial practice of sanding the wet floors in the rooms and corridors appears to prevail here. "(Signed)

"November 15, 1861." "ROBERT PEEL."

With a disposition to be critical, Sir Robert obviously had some difficulty in finding suitable subjects for his censure. As a consequence, his remarks are tame and trivial, and, as was afterwards shown, incorrect as well. The wards were in their ordinary state, and no sand has ever been used for the wet floors. Surely Sir Robert must have been sand-blind for the nonce when he made the discovery. As for the grave offence of the Matron not going round with the visitors, it is answered that she had recently been the subject of a dangerous illness, and Sir Robert knew it!

We had better close this analysis of the controversy, for we have no wish to press his mistakes to the disadvantage of the Irish Secretary; but as injured officers have a right to look for a defence in the free comments of an independent Press, we cannot conclude without expressing our surprise that the character of an old and faithful public officer should be called in question upon accusations made in secret, unsubstantiated by witnesses, and so completely false and groundless.

SUMMARY OF THE WEEK.

SCOTT *v.* WAKEM.

The law, as interpretated by juries, is very hard upon the Medical Practitioner. Whether he neglects his duty or discharges it according to his conscience, he is equally liable to punishment. This is especially true in cases of insanity. About three or four years ago there was so loud an outcry against Medical Practitioners in such cases, that most prudent men were unwilling to sign a Certificate of Lunacy lest they should be subjected to an action at law for damages. This excitement has scarcely yet lulled; and we have now another instance of the law's injustice to record. Mr. Wakem, a Surgeon of respectability and long experience, was called in haste to attend a man labouring under delirium tremens, and, finding him in a state dangerous to himself and others, considered it his duty to place him under temporary restraint. For so doing he has been dragged into a Court of Law by the patient, whose plea is that he was restrained against his own will; that Mr. Wakem, therefore, violated the law, and should be punished. The Jury were of the same opinion, and mulcted Mr. Wakem in one farthing damages with costs.

There could be no doubt of the dangerous character of the man's insanity in this instance, for it was stated in evidence, that he had taken a knife with which he had threatened to commit murder, and although he was comparatively quiet when seen by Mr. Wakem, and was washing his face, yet every practitioner knows that this act was no evidence that the danger had passed away. Had Mr. Wakem not taken measures to control his patient, and murder had occurred, what censure would he not have encountered at the hands of a jury and the public!

Are Medical Practitioners, for the future, to draw a line of distinction between delirium tremens and lunacy, and to take no precautions against violence in cases of the former affection? Or are they to forego the proper use of their judgment, and decline to resort to the necessary surveillance, or other means of control, unless the absurdity should be accomplished of the madman *giving his own consent?*

The verdict in this case shows that this is the only safe course. We therefore say to our brethren, leave the man mad from drink to himself; do not meddle with him; the law will punish you if you do. If this seem cold and inhuman counsel, remember that the inhumanity is in the law. This negative course seems the only way of enlightening public opinion upon a matter of great seriousness, and of procuring some legislative enactment that shall enable Medical Practitioners to discharge their duty without rendering themselves amenable to the penalties of a Court of Law.

THE BRITISH MEDICAL ASSOCIATION AND MEDICAL REFORM.

We observe that at the recent meeting of the British Medical Association, one or two mild attempts were made to claim for the Association the credit—or discredit shall we say?

of procuring the "Medical Act." We do not notice that Sir Charles Hastings encouraged that opinion. Do these gentlemen suppose that the history of that agitation is forgotten? We wish to cut the wings of this high-flying Association, and we tell them distinctly that they did *not* procure the "Medical Act;" that, on the contrary, they impeded its success by their blundering policy, their pre-occupation with other Bills, and the selfish class prejudices of their committee. We assert as distinctly that the "Medical Act" was mainly procured by the medico-political aid of the MEDICAL CIRCULAR. It is not necessary to open private sources of information; we are content to take our evidence from what is on record.

The present "Medical Act" was framed by Mr. Cowper. Although we knew and pointed out its defects, we felt it our duty to adopt it at the moment it was introduced to Parliament, we supported it against all opposition, and it was carried!

What was the course of the British Medical Association? Inspired by young Mr. Hastings they adopted Mr. Craufurd, then coquetted with Lord Elcho's Bill, and lastly, they stood sponsor for Mr. Headlam's measure. This was the Bill in favour of which they exerted all their strength; they had, moreover, the united aid of the Colleges; some of the Journals,—at any rate those which had an opinion—supported them; the MEDICAL CIRCULAR, single-handed, opposed them with vigour and crushed their endeavours! At the time the Bill was withdrawn, we wrote "Our brethren owe to us this useful service; we opposed the measure at the very moment when its friends believed that its triumph was secure, and we have succeeded in defeating the mighty combination of interests pledged to sustain it." We repeat these words at this date. We reiterate that the [illegible] and mu[illegible] British Medical Association up to the period of the [illegible]tion of Mr. Cowper's Bill were simply mischievous and were altogether discreditable to their sagacity and assumed influence. We affirm also that had they never meddled with Mr. Cowper's Bill, it might have been a better measure; for they lent their moral influence in behalf of the Colleges, and were accessory to the retention in the Bill of the obnoxious clauses which divide the Profession into grades, and disentitle a registered practitioner to practise and claim under the Bill, except as according to his qualification or qualifications. We arraign them at the bar of Professional opinion, on the charge that they were accessory to the enactment of the abominable clauses of that Bill. The Profession cannot place faith in the governing Council of the Association.

INSTRUCTION IN PHARMACY.

The new regulations of the College of Physicians published in this number of the MEDICAL CIRCULAR contain a rule that requires from the candidate for the new licence, a certificate of instruction in Pharmacy from some registered member of the Profession. Thus it seems that the two Metropolitan Colleges are agreed upon this point, and we have the satisfaction of knowing that the arguments we have from time to time enforced have been received and acted upon by the two most important examining bodies. The General Medical Council is, however, left behind in the race of improvement. Instead of pioneering the way, it lags in the rear; and, as yet, we have received nothing from it for which we need to be thankful. It is a cumbersome, slow, inefficient body, with a great function to discharge, and no ability to do it. When it next meets, we trust that it will enact some efficient legislation upon this subject of "Pharmacy," so that whatever defects now exist may be removed. We intend to revert to the new regulations of the College of Physicians in our next number.

THE 'DUBLIN MEDICAL PRESS' ON THE BRITISH MEDICAL ASSOCIATION.

The 'Dublin Medical Press' has an article on the proceedings of the British Medical Association, in which it censures that body for its almost total neglect of the medico-political interests of the Profession. It says that during the discussions only passing notice, if any, was taken of the movement for obtaining a representation of Medical interests in Parliament, of the cause of the Poor-law Medical Officers, of the General Medical Council, and Medical affairs generally, in all of which the 'Press' is undoubtedly right. No encouragement of science, or of Medical education, except a paltry prize offered last year, and for which nobody could be found to contend,—no politics, no definite action in any direction:—what is the use of the Association?

A QUACK DOCTOR AND HIS PRIVATE BUSINESS.—At the Middlesex Sessions on the 8th inst., Henry Walton, *alias* Henry Spiller, known as "Dr. Walton," was indicted for keeping a brothel in Castle-street, Leicester square. From the evidence adduced, it appeared that the defendant kept a surgery, or an imitation of one, at 77, Castle street; but it was the regular resort of old men, who picked up and decoyed young girls—some not older than twelve years of age—to his place, who were called "patients," the prisoner receiving the profits of this nefarious traffic. The real character of this so-called surgery was proved beyond all doubt by the evidence of the police. The defendant was found Guilty, and the Assistant Judge, who concurred entirely in the verdict, sentenced him to hard labour for twelve months, to pay a fine of 20*l*., and further to be kept in prison until the fine be paid.

APPOINTMENTS.—Russell Aldridge, M.D. Univ. Edin., L.R.C.S. Edin., L.S.A. Lond., has been elected Medical Officer for the Union Workhouse, and District No. 1 of the Yeovil Union, Somersetshire, *vice* Mr. William Fancourt Tomkyns, M.R.C.S. Eng., L.S.A. Lond., resigned. Walter Barker, M.R.C.S. Eng., L.S.A. Lond., has been appointed Assistant House-Surgeon and Out-door Visitor to the Infirmary, Stockport, Cheshire, *vice* T. Vernon Rayner, M.R.C.S. Eng., resigned. John Durham Bird, M.R.C.S. Eng., L.S.A. Lond., late House-Surgeon to the Infirmary, Stockport, Cheshire, has been elected an Honorary Staff Surgeon. Dr. W. T. Edwards (late Consulting-Surgeon) has been appointed Physician to the Glamorgan and Monmouth Infirmary, Cardiff. Thomas Frazer, M.D. Univ. Glasg., L.R.C.S. Edin., Staff Surgeon, R.N., of Pembroke Dock-yard, has been appointed to Devonport Dock-yard, *vice* William Folds, F.R.C.S. Eng., L.S.A. Lond., Staff-Surgeon, R.N., placed on the retired list. Henry Stanley Gale, M.R.C.S. Eng., L.S.A. Lond., F.R.B.S., has been elected House-Surgeon to the Stockport Infirmary, *vice* Mr. John Durham Bird, elected Staff-Surgeon. James Heygate, M.D. Univ. Edin., M.R.C.S. Eng., F.R.S., Consulting Physician to the Derbyshire General Infirmary, and J.P. for the County and Borough of Derby, has been elected to the General Council of the British Medical Association as one of the Representatives of the Midland Branch. John Hitchman, M.D. Univ. St. And., M.R.C.P. Lond. (exam.), F.R.C.S. Eng., L.S.A. Lond., has been elected to the General Council of the British Medical Association as one of the Representatives of the Midland Branch. William Charles Hood, M.D. Univ. St. And., F.R.C.P. Edin., M.R.C.P. Lond., Resident-Physician and Medical Superintendent of the Bethlem Hospital for Lunatics, has been appointed Visiting Medical Officer to the Court of Chancery. Donald MacIver, M.D. Univ. Edin., M.R.C.S. Eng., has been appointed Resident-Surgeon to the Birmingham and Midland Counties Lying-in Hospital and Dispensary for Diseases of Women and Children, *vice* Edward Spooner Machin, M.R.C.S. Eng. Richard Meredith has been appointed Public Vaccinator by the Guardians of the Dudley Union, Worcestershire. J. D. Moore, M.D. Univ. Edin., F.L.S., etc., has been appointed House-Surgeon to the Lancaster County Lunatic Asylum, *vice* P. Stark, L.R.C.P., resigned. Thomas Robert Pearson, M.R.C.S. Eng., has been appointed Assistant Medical Officer to the Nottingham County and Borough Lunatic Asylum, *vice* John Sutton, M.D. Univ. King's Coll. Aberd., M.R.C.S. Eng., resigned. Frederick John Roberts, M.R.C.S. Eng., L.S.A. Lond., has been appointed House-Surgeon to the District Infirmary, Ashton-under-Lyne, Lancashire, *vice* James Nuttall, M.D. Univ. St. And., M.R.C.S. Eng., L.S.A. Lond., resigned. Charles John Trotter, M.R.C.S Eng., and L.M., L.S.A. Lond., has been elected Medical Officer for the New Workhouse at Dean House, near Holmfirth, Huddersfield Union, Yorkshire. Augustus David Ceely Walfold, M.R.C.S. Eng., has been appointed Superintendent of the Birmingham and Midland Counties Lying-in Hospital and Dispensary for Diseases of Women and Children.

THIRTIETH ANNUAL MEETING
OF THE
BRITISH MEDICAL ASSOCIATION.

(Continued from page 133.)

veterinary schools, where the pupils in order to learn operative dexterity, are allowed and encouraged to practise severe operations on living animals. Seeing that every useful end may be attained by operating on the dead body, the practice in question has excited the just indignation, not only of the world at large, but of the Medical Profession, and has been fittingly reprobated by the organs of Medical opinion. Experimental physiology has, happily, not to answer for these revolting proceedings, though it may suffer through the indiscriminate odium they are calculated to stir up.

As to physiological experiments, strictly so called, I may remind you that a large proportion of them are attended with the immediate death of the animal, and, therefore, involve only momentary pain; or are performed when the subjects have been rendered insensible by anæsthetic agents. These, then are cases involving at the most only the sacrifice of animal life; and, when we consider the countless myriads of the brute creation that are daily slaughtered for man's sustenance, or are left to perish from hunger or the severity of the season, or fall a prey to their natural enemies, to say nothing of the multitudes killed for sport, surely it is not too much to claim that an infinitesimal share of this vast sacrifice may be applied towards the extension of human knowledge and the alleviation of human suffering. Experiments, no doubt, still remain, in which the infliction of pain, more or less protracted, cannot be avoided. In such cases, the adequacy of the end in view, and the reasonable probability of its attainment, must constitute the justification. And let it be considered that by such means most of the fundamental truths of physiology have been established, including the doctrine of the circulation itself; the practicability of important Surgical procedures has been tested; the action of poisons on the animal body demonstrated; remedies have been discovered; and innumerable results obtained, needless to specify before this audience, which have tended to the recognition of scientific truth or the promotion of the material good of mankind.

But I doubt not you will agree with me in thinking that, when a result has been thoroughly established by repeated trials and on competent authority, it is, at least as a general rule, scarcely warrantable to repeat a series of severe experiments solely to prove the matter again for our individual satisfaction; and, doubtless, you will also agree that discretion is especially required in the exhibition of painful experiments for the sake merely of instruction. In this country, indeed, the exhibition of experiments in lectures is not carried to any considerable extent. Moreover, they may, for the most part, be performed on animals deprived of sensibility. As to other cases, there are occasions when I venture to think their exhibition is justifiable and proper; as, for instance, when they serve to impress vividly on the mind some great fundamental truth in the science, or when the purpose is to impart to the learner a species of knowledge which is important for the safe practice of his Profession, but which he cannot readily acquire in any other way; as, for example, the symptoms and effects produced by various poisons, ignorance of which might lead to fatal errors in practice, or to the miscarriage of justice, and that, too, when innocent life may be at stake.

Lastly, your own experience, and your intercourse with men who have largely engaged in such experimental investigations, must convince you that there is no real foundation for their alleged evil influence on those who practise them. I need not multiply examples in support of this averment. Haller, who set a high value on experiments on animals, and often had recourse to them, was not only an illustrious physiologist, but a man of refined taste, highly accomplished in polite literature, and assuredly of no ungentle nature; and, if our social censors demand a living proof that the discreet and judicious employment of experiments on animals is not incompatible with kindness of heart and elevation of sentiment, with a scholarly taste for letters, and with serene and fruitful meditation in philosophy, I need but mention the venerated name of Sir Benjamin Brodie, who, before he became engrossed with the duties of his great professional career, had earned the highest distinction as an experimental physiologist.

In proceeding now to speak of improved methods and appliances in physiological investigation, I will first refer to the extension of our

MEANS FOR THE ACTUAL INSPECTION OF PHENOMENA.

If, under this head, I mention the microscope, I shall doubtless be told that it is of ancient use in physiology; but its powers have been enhanced and its use extended. I might also tell that, five-and-twenty years ago, I was one among the very few Medical teachers in this country who exhibited objects to students with the microscope. Indeed, at that time we had to meet and answer objections to its employment; whereas now it has become almost a household instrument. I remember, too, the time when we had to work laboriously with the simple lens, by reason of the defects of the compound microscope; but, thanks to the improvements in achromatic objectives, for which we are especially indebted to the suggestive skill of Mr. Joseph Jackson Lister, the compound instrument is now available for every purpose, and, in the hands of British and foreign makers, goes on improving both in its principal parts and accessories. And here I must not omit to acknowledge the influence of the Microscopical Society, which, by bringing together men of various pursuits for the common purpose of promoting microscopical research and encouraging improvements in the instrument, as well as by spreading the knowledge of microscopical science by their publications, has contributed in no slight degree to further the advance of physiology.

In the ophthalmoscope we have now a means of inspecting the interior of the eyeball; and although it has as yet been employed almost exclusively for the investigation of disease, nevertheless, as it brings under our scrutiny the internal surface of the eye and the condition of the transparent humours, so as to expose the cause of various entoptic phenomena and other affections of vision, it cannot fail to extend our knowledge of the physiology of the organ.

The condition of the glottis during the production of the voice, and in various states of respiration, as well as the changes of the vocal cords in the intonation of the different notes, has long been a subject of interesting inquiry to physicists and physiologists. But heretofore our knowledge has been mainly inferential, from the known structure of the vocal organ, from the results of experiments with the dead larynx, and the observation of the few changes perceptible externally, considered in relation to the laws of acoustics. Accordingly, very different views have been held, and various interpretations given of the matters in question. Now, however, a simple apparatus has been devised for bringing the glottis and its movements under the cognisance of our eyesight. In 1855, Mr. Manuel Garcia described, and caused to be exhibited to the Royal Society, a small reflecting speculum, by which he was enabled to inspect the glottis; and, at the same time, gave the results he had obtained with it in reference to the mechanism of the voice. Garcia, however, was unable to bring the whole extent of the glottis into view; but more lately, the method may almost be said to have been brought to perfection in the laryngoscope of Professor Czermak. By means of this instrument, the whole glottis and the adjacent parts are clearly seen; its condition during vocalisation and the changes of the cords in the production of the different chest and falsetto notes become patent to the eye; and the ingenious contriver has actually succeeded in producing photographs, nay, even stereoscopic views of the phenomena. It is needless to enlarge on the physiological value of this visual test applied to the various speculations on the voice. I notice it here as a conspicuous example of an unseen process in the human body, which has remained hidden through all bygone time, being in our own day brought fairly into light.

Although not strictly coming under this head, yet, as a means of exploring deep-seated phenomena, I may notice the thermo-electric multiplier, by which Becquerel, transfixing a muscle with a needle composed of two metals and connected with the multiplier, ascertained that the temperature rises during contraction. This apparatus, as well as the highly sensitive galvanic multiplier of Du Bois Reymond, may also be cited as a means of amplifying the indications of minute changes.

APPLICATION OF NUMERICAL STATEMENT TO PHYSIOLOGY.

But one of the most important steps that have been made in modern physiology is, in my judgment, the general recognition of the importance of exact numerical determination, whether as to time, space, or quantity, and its general application to those phenomena of the animal body which are susceptible of it.

A pre-eminent authority, Sir John Herschel, speaking of the advantage of numerical precision, declares that it is the very soul of science; and that its attainment affords the only criterion, or at least the best, of the truth of theories and the correctness of experiments. I may remind you that the introduction of quantitative determinations, in the time of Lavoisier, brought about a complete revolution in chemistry. It led directly to the recognition of definite combining proportions—the basis of the atomic theory—and brought in the system of chemical notation, which has entirely changed the face of the science. Moreover, the advantage gained consisted not only in the direct discovery of truth, but in the dissipation of error. The spurious, but fascinating, theory of phlogiston, which had so long held absolute sway in chemical doctrine, could notwithstand the inexorable logic of the balance.

There was an earlier time, indeed, when numbers and geometrical representations were largely dealt with in physiology; but they rested on no experimental data, and could only lead to error and confusion. I allude to the time when men's minds were so vividly impressed with the successful application of mathematics, to the phenomena of the material universe by Newton, that they were tempted, from a loose analogy, to apply geometry and the calculus where they had no legitimate place. So far, indeed, did the prevailing enthusiam extend, that even theology did not escape its influence; and a divine of the Church, who had earned some dis-

tinction in the history of infinitesimals, actually published a theological system under the strange title of 'Religionis Christianæ Principia Mathematica.'

But while the mathematical Physicians reckoned without solid empirical data, physiological inquirers of the present day seek first to obtain such data, from which they may reckon.

Numerical statement has, of course, long been usual in the chemistry of the animal body; but I wish here to refer to the application of exact measurement to the physical phenomena concerned in physiological processes; and, as a principal example, I will select the circulation of the blood.

The first, though but solitary, steps in this path of inquiry were undoubtedly made, long back in the last century, by Dr. Stephen Hales, who, though a reverend clergyman of the Church, and continually occupied with useful projects for the public good, did not scruple to engage in experiments on living animals. Dr. Hales measured the pressure of the blood in the vessels, and recognised its fluctuations, caused by the impulse of the heart and the movements of the chest. His procedure consisted in introducing a tall glass tube into a blood-vessel, and measuring the height to which the blood rose in the tube in consequence of the pressure to which it was subjected within the vessel. About thirty-years ago, M. Poiseuille, a distinguished French physicist, who, after a long interval, took up the inquiry, substituted a short bent tube containing mercury for the long unmanageable column of blood; imitating in this respect, the greater example of Torricelli, when he substituted mercury for water to measure the pressure of the atmosphere. Poiseuille's instrument, which he named the hæmadynamometer, has been of late further improved, and a contrivance has been added by which the oscillations of the mercury are inscribed in form of an undulating curve on a cylinder made to revolve by clockwork; the height of the undulations of the curve denoting the *pressure*, and their horizontal amplitude the *time*. The revolving cylinder, I may observe, is employed for recording other measurements, as, for instance, the extent and velocity of the contractions of muscle.

By this method the mean pressure of the blood in the arteries is ascertained in various species of animals, and its fluctuations caused by respiration and the heart's impulse recorded, in comparable diagrams; also the rate of decrease in the smaller vessels, and the relation of the pressure in the veins to that of the arteries. It is thus shown that the heart is adequate to propel the blood through its entire circuit, without the aid of capillary forces, vital attractions and repulsions, and various fancied agencies which have got credit for auxiliary service now shown to be not required.

The velocity of the blood, too, has been determined. Hales measured its rate in the capillaries of the frog, and the exactness of his measurement has been confirmed in our own day. The rate has been since obtained for the capillaries of warm-blooded animals. More lately, the vastly greater velocity in the large arteries has been ascertained and approximately measured by means of instruments contrived by Volckman and Vierordt. Lastly, the time of an entire circulation, or, at least, the time taken by a given portion of blood to perform its entire circuit, has been determined by a well-devised experiment of Hering, and found to be certainly not more than half a minute. This result, startling at first by reason of the unexpected shortness of the time, has been amply confirmed by subsequent experimenters.

The extreme swiftness of the blood thus demonstrated is, after all, in harmony with the known rapidity of secretion, absorption, and other phenomena depending on the circulation. Indeed, in reasoning on the animal economy, whether in health or disease, we cannot too constantly bear in mind the extreme rapidity of many of these vital processes. Had this consideration been kept in view, there would have been no need for imagining the existence of hidden passages, *viæ clandestinæ*, to account for the sudden conveyance of substances from the stomach to the kidney; or for resorting to erroneous interpretations of the marvellously sudden action of certain poisons. The same consideration enables us to conceive the redintegration of energy in rhythmically acting muscles, by nutrition in the intervals of rest, which, as pointed out by Mr. Paget, is, doubtless, a main condition of the rhythmic motion of the heart, diaphragm, and other muscles acting in like manner. I may add that the entire quantity of the blood in the body, which used to be reckoned at about twenty-eight pounds in an average man, is now ascertained to be not much above half that amount.

Exact determinations of corresponding kind have been introduced into the physiology of nerves and muscles. The extent, velocity and force of muscular contraction, under different determinate degrees of stimulus, under the influence of poisonous agents, and of various other conditions, have now been submitted to accurate measurement and record. But perhaps the greatest triumph of precise instrumental determination applied to the phenomena of life, is the measurement of the velocity with which the excitement by a stimulus is transmitted along a nerve. This has actually been accomplished through the sagacity and ingenuity of Professor Helmholtz; and the result is, that, compared with analogous phenomena in the external world, nervous excitement travels very slowly. So far from being comparable in this respect to light or electricity, it is much inferior even to sound. In the muscular nerves of frogs, Helmholtz found the average rate to be between eighty and ninety feet in a second; and, what is of great interest, he found that it was retarded by cold. The rate of speed in warm-blooded animals is but very imperfectly determined, but it would appear to be probably more than twice as great as in the frog.

To these examples others might be added, did time and my estimate of your patience permit; such as the comparison, by means of measurement, of the sensibility of different parts of the cutaneous surface, and its variations from exercise of its function, disease, and other circumstances; also the determination of the extent and force of respiration, and other physiological quantities of constants; but enough has been adduced to illustrate the spirit of exactness which now animates physiology.

PROGRESS OF PHYSIOLOGICAL CHEMISTRY.

Proceeding now to touch on the acquisitions of material knowledge and the changes in scientific doctrine which mark the progress of physiology, and beginning with physiological chemistry, I need scarcely remark, that the spirit of research in that department has been so busy, and the results obtained so vast and so varied, that, compared with its importance, my reference to the subject must be but slight and partial.

I may remind you, in the first place, of the knowledge gained concerning the proximate principles of the food; the recognition, in plants of albuminoid compounds, in virtue of which vegetable nourishment sustains animal life; the light thrown on the changes which nutrient matters undergo in the alimentary canal, fitting them for absorption and reception into the blood; and on the operation of the salivary, gastric, and pancreatic fluids in producing these changes as well as the discovery of the peculiar constituents of those fluids on which their efficacy depend.

Doubtless, also, all are well aware of the broad and luminous views emanating from Liebig and his school, as to the use, immediate destination, and ultimate disposal of the several constituents of the aliment in repairing the consumption of the tissues, and maintaining the heat of the body; and the final indentification, qualitative and quantitative, by Schmidt, Boussingault, Barral, Bischoff, and others, of the constituent elements of the nutritive principles, as discharged by the lungs, kidneys, and skin.

It is now also shown how these exuvial materials, after being delivered over to the earth and the atmosphere, in the shape of water, carbonic acid, and ammoniacal urinary products, become available as the food of plants, by which they are again combined into proximate principles, and serve anew for the sustenance of the animal kingdom. And in this admirable cycle of interchange and reciprocal compensation between the three kingdoms of nature, we are permitted to see another example of that tendency to the maintenance of order and stability so conspicuous in the phenomena of the universe.

But although the chemist thus presents us, as it were, with an accurate balance-sheet, showing the food taken into the system and the final products given out, and has shown that the supply can be identified and accounted for in the expenditure, we are still but imperfectly informed of the intermediate changes which the nutrient matters undergo, in the blood and in the tissues, before they are brought to their excreted condition. Among the actual data which afford a basis for this inquiry, and may eventually help to the solution of the question, I would refer to the several compounds which have been obtained from muscle, and which are probably immediate products of the metamorphosis of that tissue; but especially to the brilliant discovery by Bernard of the production in the animal economy of a substance analogous to starch. This amyloid substance, glycogen, shown by Bernard to be largely generated in the liver, and, according to subsequent experimenters, also in the muscles and other tissues, is supposed to be converted into sugar and finally oxidised; although Dr. Pavy, led by his very ingenious and laborious researches, has thrown doubts on its actual conversion into sugar during life. However this may be, it is plain that in the production of glycogen we see the actual formation of a hydrocarbonous product in the animal body; and as its production goes on when hydrocarbonous food, and indeed every kind of food is withheld, it probably represents one of the transitional conditions through which hydrocarbonous matter, whether proceeding directly from the food, or derived from the metamorphosis of albuminoid tissues, passes before final oxidation.

As bearing on these larger questions, I would also refer to the advances made in the chemical examination of the tissues and fluids, and especially of the blood; to the recent views respecting the condition of the inspired oxygen of the blood, and the experiments of Harley and Meyer, showing, in opposition to Magnus, that the oxygen is not merely retained in the fluid by physical absorption, but held by chemical affinity; also to the recognition of ammonia in the blood, and the well known discovery by our distinguished associate, Dr. Richardson, of its efficacy in maintaining fluidity.

It is worthy of note that in the course of such inquiries, particular facts are sometimes elicited, which afford hints of fresh discovery

and suggest important practical applications. The unlooked-for contrast between the saline constituents of the blood-plasma and corpuscles,—the one containing chiefly soda, the other potash—and the predominance of potash in muscle, taken in connexion with the well-known impairment of muscular strength and impoverishment of the blood in scurvy, led Dr. Garrod to suspect that the disease might be connected with deficiency of potash in the system. And on further reflecting that the most approved antiscorbutic remedies and aliments contain much potash, he was led to try that substance as an antidote, and so far as his experience goes, he has found it a promising one.

Instances like this should teach us not to disregard apparently slight differences, provided they are constant. I remember the time when potash and soda passed practically as equivalent; we have now reason to think that they perform very different service in the living economy. As another illustration of the point now urged, I may mention the difference observed by Dr. Edward Smith in the effects of rum and brandy, even in small quantities, on the respiration; the one always increasing the exhaled carbonic acid, the other as invariably diminishing it. And here again we are reminded that differences in various liquors or in the same liquor according to its age, although in no way cognisable by chemical analysis, cause very different effects upon the human system.

Let no one imagine that I mean to put in a word for Homœopathy. I have no faith in the dogma of *similia similibus;* nor in decillionth dilutions and dynamising processes. I wish only to urge that it is both unphilosophical and unpractical to disregard minute quantities and faintly marked differences, provided always their observed effects are constant. We are familiar with the influence of odours upon the nervous system —intense in their effects, but in substance eluding the subtlest chemistry. And I may borrow an illustration of the same point from physical science. The volatile matter in a Torricellian vacuum must be, to the last degree, attenuated, and yet it counts for much in certain phenomena. It conveys the luminous electric discharge in all its brilliancy and beauty; while, as discovered by M. Gassiot, a more perfect void, like a gulf, stops the transmission altogether. Again, it is known that obscure radiant heat is partially absorbed in passing through gases and vapours, but in very different degrees; and Professor Tyndall shows that the absorption of terrestrial rays by the vaporous odour of a flower-bed may exceed in amount that of the entire oxygen and nitrogen in the column of the atmosphere incumbent on the same area.

But it remains for me yet to notice one of the most important conclusions which the recent chemistry of nutrition tends to establish.

In an artificial machine the moving force must be supplied from without. The apparatus cannot generate force by its own intrinsic mechanism; otherwise there would be realised the principle of a perpetual motion. The spring which moves a watch must first be wound up; and it merely gives out by slow distribution the force that has been imparted to it quickly. Again, the heat which moves a steam-engine is obtained by the combustion of coal; and the sum of the heat evolved and mechanical force generated exactly corresponds with the amount of fuel consumed. Now, the belief at one time prevailed that the natural machine of the animal body was exempt from these conditions, and was endowed with the faculty of generating force intrinsically, and independently of outward agencies. A connection between the taking-in of food and the development of force was not recognised; the nourishment seemed to be destined only to grease, as it were, the wheel-work of the machine; to replace what was used up, and renew what had grown old. The teaching of modern physiology is different. In the albuminous and hydrocarbonous food, in the inspiration of oxygen, in the wear and repair of the tissues, and in the discharge of altered and residuary matters—we see materials and processes for the evolution of heat, and for the production of the energy manifested in muscular and nervous action.

The conditions are too complex, and the data of a precise and trustworthy character are, as yet, too scanty, to permit the demonstration of an exact equivalence between the heat and work produced in living bodies, and the chemical forces which are set in action. But there is still an obvious parrallelism—a certain correspondence in the variations of these two quantities—which presses on us the conviction of their mutual dependence.

But while the heat evolved in the living body can, to within a small fraction, be accounted for by known chemical actions, and the development of muscular force is measurable and is shown to be accompanied by chemical changes—chiefly oxidation of the muscular substance—with which it may be compared in amount, it must be observed, in regard to the nervous energy, that although we have indications to show that its manifestation involves consumption of nervous matter, and the one is probably proportionate to the other, yet, as we have no means of measuring the intensity of sensation and volition, not to speak of other energies of the nervous system, we cannot profess to establish their quantitative relation.

PHYSIOLOGY OF THE NERVOUS SYSTEM.

Nowhere has the spirit of modern research been more active or more fruitful than in the physiology of the nervous system; but as this was made the subject of an elaborate address delivered before the Association three years ago, I shall confine myself to one or two later accessions in this department.

I must, however, first notice the important method of research introduced some years since by Dr. Augustus Waller, for tracing the distribution and determining the functions of nerves. This method consists in taking advantage of the disorganisation of the peripheral part of a nerve which follows on its section, in order to identify its fibres, by their altered state, when associated or entangled with nerve-fibres derived from other sources; also by stimulating a nervous trunk after the fibres of one or more of its tributaries have been thus rendered ineffective, to ascertain what share of the common function belongs to each.

On all sides, inquiry has been carried on into the electricity of nerves and muscles; but out of so vast and valuable material, I would merely point out as especially worthy of attention, the investigations of Pfluger into the laws of the electric excitement of nerves, as well as the discussions to which they have given rise.

Although every part of nervous physiology possesses intense interest, I confess at this moment I feel most deeply impressed by the knowledge recently gained respecting the influence of the nervous system on the organic or nutritive functions. Many long years did physiologists search for positive experimental evidence of the influence of nerves on blood-vessels. It has now flowed in abundantly; and I cannot help ascribing some considerable share of the success of recent inquiries to the employment of the electric induction coil and intermitting current, as a much more effectual mode of electrically stimulating nerves than the means previously in use.

The influence of the nervous system on secretion has been long acknowledged. The sudden flow or arrest of various secretions through mental states, affords ample evidence of the general fact. Lately, however, it has been shown by Ludwig, Bernard, and others, that the secretion of glands, and more especially of the salivary and lachrymal glands, may be increased by artificial stimulation of their nerves, both direct and reflex. Bernard has also observed the remarkable fact, that whilst the gland is in activity and the secretion going on, the flow of blood through its vessels is greatly increased, and the passing blood thus increased in quantity, does not acquire its usual dark colour in the veins. The interesting result, too, has come out, that while stimulation of certain cerebro-spinal nerves proceeding to the salivary glands augments the secretion, similar excitement of the sympathetic branches checks its flow, and also greatly reduces the current of the blood.

It is thus plain that the nerves operate on the blood-vessels; the cerebro-spinal causing dilatation—acting probably as the vagus under similar excitement affects the heart,—whilst the sympathetic has the opposite effect. Nevertheless, there are other phenomena brought out in these experiments going a far way to show that in promoting secretion the stimulated nerve does not act merely in an indirect manner, through the change caused in the vessels; and there are not insignificant grounds for supposing that the nervous excitement may operate directly on the elements of the gland, and bring about physical and chemical changes in the contents of the gland-cells.

There is also independent evidence of a more conclusive character to prove that cells, or rather their contents, may be directly influenced through the nerves. The pigment-cells of the skin of the frog change their appearance under the influence of nerves; and this phenomenon has been shown by Professor Lister to consist, not in a contraction and dilatation of the cell-wall, as was supposed by the German physiologists, but in a movement of the minute pigmentary molecules with which these ramified cells are filled; and this movement may be brought about by stimulating the nerves both directly and in a reflex manner. That chemical changes in cells may be influenced through the nerves, is shown in a striking manner by Kölliker's experiments on the luminiferous organ of the fire-fly. Facts such as these appear to me especially worthy of regard, as the phenomena they present, being comparatively simple and open to observation, are well calculated to afford an insight into the agency of the nervous system in more recondite nutritive processes.

I am led by these considerations to remark on the great advantage that has accrued, and is likely further to accrue, from an extended acquaintance with the structure and economy of creatures of essentially simple organisation. It is in these humblest representatives of the living organism that we may hope to find physiological problems presented in their greatest simplicity, and most thoroughly disentangled from unessential complications. Many ingenious but futile theories of muscular motion would never have seen the light, had the vitally contractile substance and its affections been studied in the protozoa.

PHYSIOLOGY OF REPRODUCTION.

In the physiology of reproduction, the old question of sponta-

neous generation has been lately revived and submitted to fresh discussion; but, as I think, has been satisfactorily answered in the negative, and especially through the admirable investigations of M. Pasteur. That most able and accomplished inquirer has not only proved the non-appearance of infusorial organisms when adequate means are taken to exclude their germs, but has succeeded in actually demonstrating the presence of such germinal spores in the atmosphere. Air was made to pass through a tube filled with gun-cotton taken from a sample proved to be free from foreign admixture. The cotton was then dissolved in ether or chloroform; and sporules of algæ and other simple organisms, which had been entangled and arrested in their passage, were found in the liquid. It cannot but occur to us that this simple and to all appearance efficacious method might be advantageously employed to explore miasmatic and infected atmospheres. M. Pasteur was led on by these inquiries to a careful study of the phenomena of fermentation; and he has not only added largely to our knowledge of the chemical changes and products presenting themselves in that remarkable process, but has thrown much light on the operation of the living organisms on whose presence and influence it appears to depend.

But while origin from parents and reproduction of their like still remain as great characters of living beings, it has been discovered that, in some of the lower grades of the animal kingdom, the offspring, before reaching the condition of the parent, passes through a series of strange vicissitudes, not merely representing the changes of form, structure, and habits observed in the well-known transitions of an ordinary larva, but involving the production of a new brood or of new broods by the still unfinished being, differing from it in form and structure, but finally assuming the characters of the original parent. Various insulated cases of this phenomenon, delusive as they sometimes were to systematising naturalists, had previously been noticed in different quarters; but the first connected view of the subject was given by the Danish naturalist, Steenstrup, in a work which had been translated and published by the Ray Society.

The process now referred to has been named "alternate generation," or metagenesis. It possesses a special claim on the interest of the Medical Profession, inasmuch as some most interesting examples of it occur among the entozoa. It is now known, for instance, that the cysticercus is but a certain state or stage of the tapeworm; and here I must refer to the interesting researches of Mr. George Rainey on this subject published in the 'Philosophical Transactions.' I have time, however, only to explain that, while the stages of transition from the cysticercus to the tænia had been satisfactorily traced, Mr. Rainey discovered that the tænia-embryo, in its conversion into the cysticercus, passed through a curious phase which had not been till then observed.

I pass over the renewed investigations on the generation of the aphides, which has been a curious subject of speculation since the days of Bonnet and Reaumur, in order that I may dwell a moment on the startling discovery that animals with sexual organisation, and holding no mean place in the scale of being, may produce young from eggs that have never been fertilised by the male. I doubt not you have heard of the remarkable observations of Dzierzon and Von Siebold, which prove that the eggs of the queen-bee produce drones without being impregnated, and that the impregnated eggs invariably produce neuters. No explanation has been attempted of this singular result, except in reference to its final purpose in the economy of the hive; and it becomes all the more perplexing when compared with the case of certain moths, in which parthenogenesis has also been discovered; for, in some of these, unimpregnated eggs give rise exclusively to female offspring, whilst in the silkworm both male and female young may issue from eggs without impregnation.

With regard to the actual process of impregnation, it is now satisfactorily proved that the male element passes into the interior of the ovum. Spermatozoa—improperly so called—have now been traced within the ovum in many different animals, mammalia not excepted; and there can be no doubt that this is the general condition of sexual fecundation.

The study of embryonic development, which had engaged the interest of the great Greek naturalist, and was prosecuted with more or less success after the revival of science down to the epoch of Caspar Frederick Wolff in the last century, received a fresh impulse from the admirable researches of Pander on the evolution of the chick, now more than forty years ago. Pander, in fact, discovered a fundamental principle which regulates the early stages of the process, and which became, as it were, a compass to guide succeeding explorers in this interesting but difficult field. Investigation has now been pushed so far, that I believe I am right in saying that the development of the embryo has been studied, more or less fully, in examples representing all the great, and many of the subordinate, divisions of the animal kingdom.

You are aware that the study of embryogeny, besides serving to elucidate the genetic economy in the particular animal type to which each example belongs, has a twofold general application,—namely, first, to the establishment of the general laws of formation of the animal body, and the relations as to homology of its several parts; and, secondly, to the investigation of the development and essential relations of its constituent textures; in short, to morphology and to histology.

The doctrine of homology, which took its rise through the genius of Göothe, and which has since been so ably and successfully prosecuted, by comparison of the mature animal structure, by Geoffroy and Meckel, and especially by Owen, was placed on the securer, but yet not exclusive basis of embryology, through the sagacity and industry of Rathke and Von Baer. The surpassing beauty and interest of the teachings of homology are seen especially in its relations to comparative anatomy and zoology, and, therefore, I should not make further reference to it here, even did I feel myself more competent to the task.

RECENT ADVANCES IN HISTOLOGY.

For the first quarter of the present century, and more, the study of the animal tissues and of the intimate structure of the viscera scarcely moved beyond the point at which it was left by Bichat. Its signal advance since that time has, I need scarcely say, been mainly owing to the extended use of the microscope and the improvements in that instrument, as well as the skilful employment of suitable reagents for bringing out the microscopic characters of the objects, and in the improvement of these last-mentioned resources, there is no name more deserving of honourable mention than that of our able and jealous associate, Professor Beale. But in following the history of modern inquiry, it is pleasing, from time to time, to meet with examples evincing correct and careful work by Leeuwenhoek, Malpighi, our ingenious countryman, Hooke, and other early labourers in this field; instances, indeed, of true but neglected observations of that early time verified in our own day; like living seeds long dormant in the ground, which are turned up by the furrow of a later cultivation.

But to return to the development and nutrition of the tissues:

The grand feature of progress in this direction is the application to the animal tissues of the principle of cell-agency and cell-metamorphosis, which had already been recognised in the vegetable kingdom.

The cell-theory of animal growth and development, on its promulgation by Schwann, in 1839, was received and adopted with eagerness, amounting almost to enthusiasm. Men fancied that in the "power of the cell" they had found a key to unlock the secrets of life. Each cell had, as it were, its ministering genius, working out an assigned task in the living economy. There was, in truth, a return to the Helmontian doctrine of the archeus: but instead of a single autocratic ruler over the whole system, it was the conception of a confederation of archeoli, each dominating in its own cell, and all acting in concert towards a purpose, like bees in a hive. But although the fact of the several existence and joint operation of cells was true, it was seen on a more sober view, that to ascribe this to an all-efficient cell-power amounted to no real explanation.

After making all reasonable abatement, however, the cell-theory, modified as it has been, and still undergoing modification, remains one of the most fertile ideas in modern physiology.

Among the simplest modes of animal and vegetable existence, we have examples of a body with the characters of a cell constituting a complete organism; assuming nourishment, undergoing growth, and reproducing its life,—exercising, in short, the functions of an independent living being. The offspring of the higher animals first appears as a cell, and the embryo for a time consists of an aggregation of cells. Throughout after-life, also, certain textures retain their cellular structure. Cells are employed in separating matters from the blood to be discharged in secretion, and may become the seat of chemical and plastic processes, or even of higher operations, as in the nervous system.

It was, however, soon perceived that various kinds of tissue were produced without the immediate intervention of cells, by molecular changes taking place in an amorphous intercellular substance. But even in this case it is held by many that this substance is first converted from raw material into an organisable blastema by the agency of the neighbouring cells.

Again, the efficacy of cells has been very variously estimated in the nutrition of the mature organs and textures. On the one hand, it is maintained that the organised fabric is kept up, like the population of a city, by the continual formation of new structural elements, to take the place of the old; and this is undoubtedly true of epidermis and some allied structures; on the other hand, it is contended, with much reason, that, with the exceptions alluded to, renewal may take place, particle by particle, the new matter replacing the old by what may be called molecular substitution. But even among those who adopt this last hypothesis, it is with some a favourite opinion, that the bodies like cell-nuclei, which are persistent in most of the mature tissues, if they do not generate new form elements, at least select the appropriate materials from the interstitial fluid, and fit them for taking part in the organic structure.

But it has been urged, and justly, that the so-called "cells" are not always and necessarily vesicular in structure; that the envelope, or cell-wall, is not an essential part, and that the nucleus, and

more or less of the matter surrounding it, really constitute the organically active element. In this view, therefore, the envelope, when present, is merely an insulating and containing part, which might be compared to the flask which holds the active ingredients in a chemical process. Still it is a permeable shell, which permits of the entrance and issue of matter; and it stands in intimate relation to the intercellular substances. There may or may not be a distinct vesicular envelope, but in either case the nucleus and cell contents remain insulated in and contrasted in properties with the intercellular substance. To express this relation, Mr. Huxley accordingly proposes to call the former the "edoplast," and to distinguish the surrounding substance with the envelope if present as the "periplast."

Lastly, a wide difference of opinion prevails as to the origin of cells. Some physiologists and phytologists hold that cells are invariably and exclusively derived from other cells; that all the cells of an organism are descended by successive generations from the cell of the ovum originally proceeding from the parent. It is as strenuously maintained by others that nuclei and cells may arise independently in an organisable blastema, nay, that they may be produced in fluid organic matter by a merely physical process.

Neither confident assertion of opinion nor ample allegation of fact is wanting on either side of this and the other questions referred to. Observations, conflicting with each other, spring up indeed on all sides, in rank growth, but the time is not come for separating the tares from the wheat.

THE FORCES OF THE LIVING ORGANISM.

And now, gentlemen, in drawing to a close, I may be expected to say a word on the prevailing views as to the powers which animate the living organism.

I have already remarked that many of the processes of the living economy issue in physical or chemical results, and I have stated that the more or less close relation subsisting between these results, so far as they can be estimated, and the consumption and oxidation of nutriment, as indicated in respiration and excretion, would seem to show that the chemical and mechanical forces developed are derived from an extrinsic source; but, at the same time that there are energies displayed in the living body not yet estimated in amount, concerning which, therefore, there is not the same clear evidence. I refer especially to the nervous energy.

In speaking, however, of the nerve force, I understand that force which is common to all creatures possessing a nervous system, from the highest to the lowest. I do not refer to the highest attributes of man, to his sense of moral responsibility, his consciousness of dependence on a higher power, and his aspirations after perfection in a future state.

This nervous force has long been likened to electricity; but rather through a vague perception of analogy than from any rigorous comparison. It is true that electric force is developed in the nerves, and even exhibits modifications connected with different conditions of nervous action. Still, it must be borne in mind that the evolution of electricity is a common accompaniment of various processes involving chemical change, whether within the body or in external nature; and the tendency of recent speculation is not towards identification of the nerve force with electricity, but rather to suggest that the two stand related in the same way as electricity and other physical forces are related to each other; that is, as manifestations of a common force or energy, of which they, severally, are the special modifications.

Since the memorable experiments of Count Rumford on the heat of friction, which led that philosopher to the conclusion that heat is a form of motion, and the determination by Dr. Joule at a later period, of the equivalent of heat expressed in mechanical work, the doctrine of commutability and equivalence of force, first applied to these two agencies, has extended itself to the other forces operating in the material universe. Accordingly, the opinion is now gaining consistency and acceptance, that mechanical energy, heat, light, chemical action, electricity and magnetism, are mutually convertible, and are respectively equivalent to each other; moreover, that they are probably all the expression of a common force which manifests itself under these several modifications, according to the different material or dynamic conditions in which it operates.

Now, the belief has some time prevailed that the nervous, with perhaps other forms of organic energy, has its place in the same circle of reciprocally productive and equivalent forces; and not being electricity more than it is heat or chemical affinity, yet stands related to electricity and the other forces in the same way that they are related to each other.

But supposing this probable doctrine to be proved and to betoken a signal advance in physiology, are we come to the end of our inquiries? are we thereby enabled to explain even the most characteristic phenomena of the living organism?

By mechanical force duly applied, a fabric may be woven, as well, or perhaps better, than by human hands; but by what intelligent pre-arrangement is the pattern determined and finally brought out? So in the production and development of an animal, and in its subsequent workings,—given the force or forces operating,—how are the determinate forms and qualities of the organism produced?

To all our most exquisite means of scrutiny, the ovum, as it proceeds from the parent, presents nothing to indicate the course of its future development; and yet we speedily can discern in it the traces of the new being, and recognise the successive appearance of each new member and organ—in due time and form and proportion—until the body is built up and completed after the pattern of the parent. We can perceive nothing in the ovum of man to distinguish it from that of a quadruped, although their final destination is so different. We are constrained, therefore, to admit some pre-existent condition, to us inscrutable, which determines the specific direction in which the forces, acting in development, although probably supplied from without, must operate within the organism. And the marvel reaches its height when we reflect, that not the character of the species merely, but the individual likeness of the parent—aye, of both parents—displays itself in the offspring; and not alone in bodily feature, but often also in intellectual and moral peculiarities.

Then, not alone in regulated form and proportion do the parts appear, but all fitting harmoniously the one to the other, and each in its appointed time. The periods of incubation and gestation, different but determinate in each species; the regulated time of consolidation and completion of the bones of the skeleton; of the eruption and succession of the teeth; the periods of maturity and decline of the whole body and of particular organs; and a host of examples supplied by the history of the lower members of the creation, serve to illustrate that conspicuous law of subordination to time in the phenomena of the organic world, which Mr. Paget has aptly designated as the "chronometry of life."

Now, while we can in many cases discern the purpose of these adaptations of form, proportion, and time, and perceive how they, as it were, fit in with, although not apparently produced by, the outward circumstances in which the organism is placed; and while we must revere the infinite wisdom by which they are harmoniously brought about, we are still utterly at a loss to explain them by reference to efficient causes. In some of the lowest tribes of animals, it is true, the results are effected more or less by physical influences, but these influences operate upon internal conditions, existing independently. In the human body, even, you may cramp the growth of a Chinese foot or flatten a Carib skull, but this is suppression or distortion, not formation.

The growth of a finger or a tooth may be traced, and various steps in the process explained: but the acquirement by these and other parts, and indeed by the entire body, of their characteristic form and proportion, is still an inscrutable, at least an unpenetrated mystery. Unpenetrated, I mean, as regards the physical or efficient causes of the phenomena, for the purpose or final cause is often patent; and hence we see that teleological explanation holds, and doubtless must continue to hold, a large place in physiology.

But, finally, shall we, on that account, censure as rash or stigmatise as impious all attempts to go further? Shall we presumptuously set limits to the scope of those inquiring faculties which God has conferred on man, or prejudge, and reject by anticipation, conclusions to which their rational and reverential exercise may lead? Assuredly not. Let us not, therefore, with narrow views of the scheme of Providence, worthy of a darker age, join in blindly denouncing the genial effort of one of the foremost men of science in our time, to refer mutations of organic form and the origin of species to natural causes of known operation. Faint as some may deem the prospect of success of Mr. Darwin's great attempt, let none condemn its tendency. Should it ever be shown that the wonderful adaptation and harmonious working, so conspicuous in the living creation, have been brought about by the operation of great natural causes, originally ordained by the Author of the Universe, and acting through countless ages of time, surely such an issue could but tend to enlighten and exalt our conceptions of creative wisdom.

A warm vote of thanks for this admirable address was moved by Mr. Paget (London), and seconded by Mr. Turner (Manchester), and carried unanimously.

PAPERS.

The following papers were then read:

A Paper by Dr. WYNN WILLIAMS, on *Compound Comminuted Fractures of the Skull.*

A Paper, by Dr. HARLEY, was then read on *The Value of Urinary Analysis in the Diagnosis and Treatment of Hepatic Disease.*

THE PHARMACOPŒIAL WEIGHTS AND MEASURES.

The PRESIDENT: In accordance with notice given yesterday, I am about to read this resolution, proposed by Dr. Hodgkin:—

"That the British Medical Association desire, in the most courteous manner, to express to the General Medical Council a hope that the proposed alteration of the weights to be used in medicine may not be carried into effect; but that they may be allowed to remain as they now exist, unless the Council, with the sanction of the Government, is prepared to introduce the

metric system already adopted, with great advantage, by many other countries."

I have nothing to say upon the resolution, except that this subject is, at the present moment, under the very deep consideration of the General Medical Council and its Executive Committee, and that they have submitted the question to various scientific men, who have, from time to time, shown great interest in the subject of the weights and measures to be employed throughout the United Kingdom.

The [illegible] of thanks having been given to Dr. Burrows, the [illegible]me p[illegible] it cannot [illegible] specific[illegible]gs terminated.

[illegible]

GENERAL CORRESPONDENCE.

To the Editor of the Medical Circular.

SIR,—A most important disputation is going on between the governing body of the Royal College of Surgeons of England; and the General Council of Medical Education, concerning the proper mode of educating the rising generation of Medical men.

The principle endorsed by the Medical Council has been already carried too far, as I believe most Medical men of large experience can testify. The men of the present day, after passing the examinations which recognise them as fully qualified practitioners, far too frequently begin practice as mere theorists, altogether unacquainted with the duties pertaining to the Physician-Surgeon, and quite incapable of accommodating themselves to them.

I was in London for a few days during the last month where I met many provincial surgeons engaged in extensive practice, and I could not help being struck with the similarity of our views on this question. Physician-Surgeons must be practical men, as well as theorists, and unless the present mode of education be arrested and changed, the treatment of the diseases of the masses will necessarily pass into hands unrecognised by our mismanaged Colleges and Universities. Before the appointment of the Medical Council the system of education had become far too theoretical, and from the men appointed on that Council what result could have been expected but an aggravation of the evil?

Where is the representative of the Physician-Surgeon in that Council?—the Medical man of the masses, and, in education, on an equality with the pure Surgeon or pure Physician. He is not to be found, but is supposed to be represented by the Sharpeys, Bonds, Storrars, Aclands, &c. &c., eminent men, still unquestionably not the representatives of the interests of the great body of Medical practitioners in this country; and until those interests are fairly represented in the General Council of Medical Education, it would be irrational to expect even just medical legislation.

The existing system, as necessitated by the General Council of Medical Education, by the governing bodies of our Colleges and Universities, is degrading to an honourable profession. It goes further and further in a selfish direction. It directs that medical knowledge in the shape of lectures, &c., shall be purchased of particular men—those men being too frequently the examiners for, and, *virtually* the vendors of medical degrees, because they in many instances are the recipients of the fees paid for the same! Can anything be more absurd than that newly-fledged London Physicians and Surgeons should be recognised as legal teachers, whilst men who have passed the same examinations and possibly acquired an infinitely greater amount of practical experience, and teaching power, are ignored.

The present system cannot be persisted in. Let us hope that the profession is sufficiently enlightened to command not a sham but a real reform. Let students be no longer compelled to purchase their knowledge of particular men, not unfrequently the very same who examine them, and have a pecuniary interest in granting them their degrees. A scandalous system; let it no longer be inquired *how*, *when*, or *where*, knowledge might have been acquired, but by a searching, practical as well as theoretical examination, ascertain that it be possessed. There should be no doubt about the matter, as is too frequently the case in the present mode of conducting examinations. Hoping that I shall not trespass too much on your space, and that the views I have ventured to express will be in accordance with your own.

I am, &c., EDWIN HEARNE.

Southampton, August 11th, 1862.

MURDER OF A POOR-LAW MEDICAL OFFICER.

To the Editor of the Medical Circular.

SIR,—In the early part of last month, you kindly gave insertion to an appeal I made on behalf of the widow and family of the late Mr. Puckett, who was murdered and decapitated by an insane pauper; that appeal I am happy to announce has already been responded to most liberally, and upwards of 800*l.* have been subscribed. My object in now writing is to inform your readers that I shall feel obliged by those who desire to subscribe, or who have promised subscriptions, but have not sent the money, that they will in the course of this month forward their subscriptions, either to myself or to the banks of Messrs. Eliot, Messrs. Williams, or the Wilts and Dorset, all of Weymouth, in order that I may make out correct lists for publication. In my next I will explain the way in which the money has been applied.

I am, &c., RICHARD GRIFFIN.

12 Royal terrace, Weymouth, August, 16th, 1862.

[It is very satisfactory to find that Mr. Griffin's appeal has met with so liberal a response; we hope that the funds supplied will meet, at least, the immediate exigencies of the bereaved family, and that some more permanent provision will be ultimately made.—ED. MEDICAL CIRCULAR.]

Births, Marriages, and Deaths.

BIRTHS.

BROWN.—On the 3rd inst., at St. Margaret's banks, Rochester, the wife of Frederick James Brown, M.D., of a son.

JOYCE.—On the 5th inst., at Ashby-de-la-Zouch, the wife of William Joyce, Esq., M.R.C.S., of twins—son and daughter, the latter still-born.

PATERSON.—On the 7th inst., at Belbeggie, Perthshire, the wife of Dr. George K. H. Paterson, L.R.C.S.E., of a daughter.

POLLOCK.—On the 4th inst., at Montague place, Russell square, the wife of A. J. Pollock, M.D., of a daughter.

ROSS.—On the 3rd inst., at Dudley house, Guildford, the wife of Fred. Dumaresq Ross, L.R.C.P.E., of a daughter.

TYLER.—On the 6th inst., the wife of Edward A. Tyler, Esq., L.S.A., of High street, Manchester square, of a daughter.

MARRIAGES.

BURDEN—M'CORMAC.—On the 5th inst., at St. Ann's church, Belfast, Henry Burden, M.D., to Ann, second daughter of Henry M'Cormac, M.D.

GREY—COOK.—At Cradock, Cape of Good Hope, in St. Peter's church, George Grey, M.D., J.P., to Mary Frances, second daughter of the late Rev. Edward Cook, Missionary in Namaqualand, South African Orange River State.

KECK—GORE.—On the 16th ult., at St. George's church, Hanover square, Major the Hon. Henry Littleton Powys Keck, of Stoughton Grange, Leicestershire, to Maria, youngest surviving daughter of the late Vice-Admiral Sir John Gore, G.C.B., G.C.H.

WATSON—WATSON.—On the 6th inst., at St. Marylebone church, Thos. Wm. Wasdale Watson, Esq., M.R.C.S., eldest son of the late Thomas Watson, Esq., of Bishop's Stortford, Herts, to Margaret Elizabeth Augusta, only daughter of John Burges Watson, Esq., of Nottingham place, York gate.

WILSON—CRAWFORD.—On the 28th ult., at Dublin, William Wilson, Esq., M.R.C.S., Medical Officer to the Keadue Dispensary, Assistant-Surgeon 93rd Regiment Roscommon Militia, to Mary, youngest daughter of James Crawford, Esq., of Keadue.

DEATHS.

RAKE.—On the 4th inst., at Fordingbridge, Ellen Mary, only daughter of Thomas Beaven Rake, Esq., M.R.C.S., aged 3 years and 4 months.

THORNTON.—On the 10th inst., at Atherstone, Warwickshire, David Clarke Thornhill, Esq., M.R.C.S., late of Stratford green, Essex, aged 31.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on the 7th inst.:—John Edwin Foster, the Oaks, Harrogate; Gwynne Henry Harries, Haverfordwest; John Jones, Drury lane; Alexander Leadman, Leeds, Yorkshire; Percy Milligan, Keighley, Yorkshire; Charles Orton, March, Cambridgeshire.

The following gentlemen also on the same day passed their first examination:—Griffith Llewelyn Carreg, Queen's College, Birmingham; Ebenezer Snell, Middlesex Hospital.

UNIVERSITY OF ABERDEEN.—At the late Graduation Term, the following candidates, after the usual examinations, received degrees in Medicine and Surgery, making the total number during the year twenty-eight, viz.:—*Degree of M.D.*—David Manson (honourably distinguished), William Gauld, John Grant. *Degree of M.B.*—Alexander Ferrier Angus Fairweather, David Arthur Leslie, James Murray, Charles Smart. *Degree of M.C.*—David Manson (honourably distinguished), Alexander Ferrier Angus Fairweather, William Gauld, John Grant, David Arthur Leslie, James Murray, Charles Smart.

At the same time, the following were declared to have passed part of their examinations:—Charles Alexander, George Andrew, Charles Buchan, Alexander Collie, Robert Collins, James Davidson, John Eadon, William J. Elmslie, Owen Evans, James E. Fowler, F. G. Fropier, James A. S. Grant, Edward Gray, William M. Harmer, Alexander Johnston, Robert Davidson Kemp, William M'Lean, John B. M'Leod, John S. M'Robbie, Patrick Manson, William F. Morrison, James Ross, Andrew Skeen, James Dear Smith, Robert Walker, George Yeats, David Young.

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH.—DOUBLE QUALIFICATION.—The following gentlemen have passed

their first professional examinations during the recent sittings of the examiners :—George Dickson, Edinburgh ; William Bentley Ford, Waterford ; James Jamieson, Bowden ; John Johnstone, Liverpool ; George Macdonald, Perthshire ; Alex. J. Macgregor, Perthshire ; Paul Moffatt, Northumberland ; James M'Caul, Edinburgh ; Schoedde Robertson, County Westmeath ; John Stewart, Berwickshire.

The following gentlemen have passed their final examinations, and been admitted L.R.C.P.E. and L.R.C.S.E. :—William Sealy Barry, Knockurn ; Edward Johnson, Calcutta ; W. J. Kennedy, Londonderry ; J. B. Morehouse, Holmfirth ; William M'Nab, Co. Derry ; J. J. M'Keogh, Co. Tipperary ; Robert Stobie, Orkney.

Royal College of Surgeons, Edinburgh.—The following gentlemen have passed their first professional examinations during the recent sittings of the examiners :—A. M. Anderson, Tummelbridge; John Currie, Dunfermline; Stewart Cowper, Coatbridge ; Joseph Fleming, County Donegal ; Gordon Hammond, Brechin ; John Millar, Edinburgh ; John Macdougall, Glasgow ; William Walker, Ayrshire ; James Watson, Edinburgh.

The following gentlemen have passed their final examinations, and obtained the diploma of Licentiate of the College :—Alexander Allison, Strathhaven ; John Buckley, Cork ; James H. G. Hill, Bengal ; James Hardie, East-Lothian ; W. Lorraine, Dumfriesshire ; W. M. Muirhead, Edinburgh ; Robert H. Newett, County Louth ; John R. Ryley, Waterford ; Charles H. Skae, Edinburgh ; Peter White, Haddington.

New Visiting Commissioners in Lunacy.—Dr. Hood and Dr. Bucknill are appointed Visiting Physicians to the Court of Chancery under the recent Act of Parliament.

The Seamen's Hospital.—In addition to other liberal benefactions made by his Highness the Viceroy of Egypt during his stay in this country, he sent a donation of 100*l.* to the Seamen's Hospital, *Dreadnought*.

Lying-in Hospital at Liverpool. — The new Lying-in Hospital, situated in Myrtle street, opposite the Philharmonic Hall, was opened on the 24th ult. by the Lord Bishop of Chester. The building, a very handsome structure from the design of Mr. J. D. Jee, cost upwards of 3,000*l.*, and is capable of accommodating forty patients, as well as the necessary staff.

The Rejected Candidates.—The Madras Government have reversed the decision of the home authorities in the case of Mr. Thompson, an Anglo-Indian, and Pandey, a native, who were not allowed to enter H. M.'s medical service, after having been induced to come to England to compete for the Indian service. Both have been appointed sub-assistant surgeons without examination, and will do duty in the vaccination department.

Medical Missions.—For the last twenty years a Society of medical men has been engaged in Edinburgh in educating and sending forth medical missionaries to foreign parts ; but no organisation for a similar purpose has existed in England. The recent session of the British Medical Association in London has furnished an opportunity of laying before the English members of the profession the claims of Christian missions among the heathen upon medical men. With this view a meeting of the Christian Medical Association was held at St. James's Hall on Thursday, the 7th instant, under the presidency of the treasurer, R. D. Grainger, F.R.S. ; and the members of the British Medical Association were invited to be present. The supremely beneficent character of such missions to the ignorant and the sick poor in heathen countries, and their influence in disposing the people to receive the facts and doctrines of Christianity, were shown in a brief address by David Paterson, Esq., a medical missionary at Madras. At the close of the meeting a committee was directed to arrange and carry out a plan by which the profession in England might contribute to the spread of Christianity by means of medical missions.

"Anonymous."—On the 24th ult., a gentleman called at the Charing-cross Hospital, and inquired of the porter whether some money which he just put into one of the collecting boxes would be safe. Having been assured it would, he immediately went away. On the same day a friend of the institution, walking past the box, saw something in it. On applying his pen-knife carefully he extracted twenty-two 10*l.* notes. Having taken them into the hospital, and informed the resident officers of the circumstance, the box was examined, and three more found, making a total of 250*l.*, thus freely and anonymously contributed to its funds.

Death from Chloroform.—On Monday an inquiry was held at the King's College Hospital, before Mr. Bedford, the Coroner for Westminster, touching the death of Elizabeth Freed, aged 17. Mr. R. Partridge, Surgeon of the Hospital, deposed that the deceased was admitted on July 23, and died on August 8. He understood she met with an accident by falling against an iron railing, and she was suffering from a very offensive mortifying wound. It was necessary, for the purpose of closing the wound, that a short but sharp operation should be undergone. The deceased consented to take chloroform, and, being a very nervous girl, it was administered with great precaution. In consequence of the deceased having a feeble and fatty heart, which had not been discovered, the deceased died in a short time after the chloroform was administered. The jury consulted for a short time, and returned the following verdict : —"That the deceased died from the administration of chloroform, in consequence of a disease of the heart, but the jury find that the chloroform was properly administered."

The late John Medd, Esq.—In the 'Advertiser' of last week it was our melancholy duty to record the death of John Medd, Esq., of the Mansion House, High Street, Senior Surgeon of the Stockport Infirmary. The lamented deceased was the youngest, and sole surviving son of the late William Medd, Esq., of Haggate Hill, Cleveland, in the North Riding of York, whose grandfather, Mr. John Medd (or Meed, as the name was often spelt and pronounced at that time,) had left Essex, and was settled in Bilsdale, in Yorkshire, in the year 1715. Mr. Medd studied medicine both in London and Edinburgh, becoming L.S.A. in 1825, and M.R.C.S.,E., in 1826, and practised first at Leyburn, in Yorkshire. Thence he removed to Stockport, in 1830, having purchased the practice of Mr. Edward Lacy, surgeon, of the Great Underbank. In 1844, he received the honorary appointment of Fellow of the Royal College of Surgeons. Though quite a stranger amongst us, his undoubted skill in his profession, and his unremitting attention to his patients, soon introduced him to an extensive practice amongst the principal inhabitants of this borough and the gentry of the surrounding district. Nor was his private character less sterling than his professional attainments, for in that position he was a kind husband, an indulgent father, and a warm friend. Indeed, his heart was so generous that the whole theory of his life, rigidly reduced to practice, was to ensure the greatest happiness of the greatest number. These are words of high commendation, but they are strictly true. His death was occasioned by a complication of diseases induced by exposure and fatigue in visiting his numerous patients, whom no personal considerations or inclemency of weather ever prevented him from visiting, when he ought to have been "nursing" himself by his own fireside. Mr. Medd leaves behind him, to mourn their bereavement, a widow and six sons, of whom the Rev. Peter Goldsmith Medd, M.A., Fellow, Tutor, and Dean of University College, Oxford, is the eldest. Mr. W. H. Medd, surgeon to the Stockport Infirmary, and partner with his late father, and Dr. John Medd, of Manchester, are already in practice. His fourth son, Mr. G. T. Medd, entered the Royal Navy at thirteen, and having served in the West Indies and the Mediterranean, as well as in the Chinese and Crimean Wars, where he gained two medals, attained the rank of Lieutenant at an unusually early age. His two youngest sons (of whom the elder has graduated in double honours,) are members of University College, Oxford. Of the true interests of the Infirmary he was always a warm and consistent supporter, having, in addition to the uniformity of his zeal, been instrumental in raising considerable sums of money towards its funds from his large and influential circle of friends. The high and distinguished sense of his invaluable services to the institution was evinced by the following Vote of Condolence to the family, passed at the weekly meeting of the Board of the Infirmary, on Monday last :—Resolved,— "That this Board receives the announcement of Mr. Medd's death with feelings of profoundest regret and surprise. Only a few short weeks ago, he was with us at this Board, in apparent health and strength, likely, in all probability, for the enjoyment of many years of life and usefulness. But the inscrutable dispensation of an All-wise Providence has fallen upon him, and he is 'gathered to his fathers.' The loss sustained by his death will be heavily felt in all quarters. To his family it is irreparable ; they have lost one who, as the head of the family, was distinguished. This Institution has lost its Senior Surgeon, who, for nearly 30 years, has discharged the duties of his responsible office with an ability, intelligence, and success, seldom equalled ; and, beginning from a period when the duties were more onerous, inasmuch as the Staff had to visit the Home Patients, the minutes of the Charity contain no record of a complaint as to his attendance ; and few men were more distinguished for the accurate and conscientious discharge of his duty to the patients under his charge. The memory of the past, when reviewed from the sad present, only shows how much he was in earnest in all he did, and increases the already high appreciation entertained of his great abilities and unflagging industry, as well as the extent of the loss which this Charity and the poor have suffered by his demise. To Mrs. Medd and the family, the Board would respectfully offer their sincerest condolence and sympathy."—'Stockport Advertiser.'

APPOINTMENTS FOR THE WEEK.

Wednesday, August 20.

Operations at Middlesex Hospital, 1 p.m. ; St Mary's Hospital, 1 p.m. ; University College Hospital, 2 p.m. ; Royal Orthopædic Hospital, 2 p.m.

Thursday, August 21.

Operations at St George's Hospital, 1 p.m. ; Central London Ophthalmic, 1 p.m. ; London Hospital, 1½ p.m. ; Royal Free Hospital, 1½ p.m. ; Great Northern Hospital, King's cross, 2 p.m. ; West London Hospital, 2 p.m. London Surgical Home, 2 p.m.—Ruptured Perinæum ; Vesico-Vaginal Fistula.

Friday, August 22.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, August 23.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital 2 p.m.

Monday, August 25.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, August 26.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

NOTICES TO CORRESPONDENTS.

Mr. HENRY T.—1st. No.—2nd. No.

DUBITANS.—1st. It would be difficult to answer Dubitans' question with reference to Julia Pastrana, without a complete examination of the scalp. The integument has, no doubt, undergone considerable alteration from the process to which it was subjected.—2nd. The process is unknown.—3rd. The art of embalming was well understood by the Peruvians, who are supposed to have used a bituminous substance.—4th. Petroleum has long had the merit of being an useful agent for the purpose.

M.R.C.S. Eng.—The decision in Mr. Wakem's case should be a warning to all Medical practitioners, how they deal with drunkards. The law does not recognise them as lunatics, however insane they be. The best way is to leave them to the Police. There ought to be a Medical Defence Association to protect the Profession against the consequences of such actions.

SCOTUS.—Dr. Laycock's Address on the occasion of the capping at Edinburgh is characterised by good sense and enlightened views of Medical policy. Its great length, however, precludes its publication in the MEDICAL CIRCULAR.

THE TITLE OF DOCTOR.

To the Editor of the Medical Circular.

SIR,—I have read with pleasure an excellent letter by "Censor" in the 'Lancet' of the 9th inst., on the 'Title of Doctor.'

No Fellow, Member, or Licentiate of the College of Physicians, shall assume the title of Doctor of Medicine, or use any other name, title, or designation, or distinction, implying that he is a Graduate in Medicine of *any* University, unless he is so. They all have taken this oath, how can they in direct violation of the solemn oaths they have taken when admitted, put Dr. on their door, and sign themselves M.D., knowing they subject themselves to a fine of 10*l.*, or of being degraded.

August 12th, 1862. I am, &c., ANOTHER CENSOR.

Dr. S. B.—The circumstances are so imperfectly stated, that we cannot form an opinion.

OMEGA.—You should first ascertain if the fee had been paid. We do not think, however, that it is one of those cases in which a half fee could be with propriety claimed. We must all hold ourselves in readiness to render a little friendly assistance to our neighbours. Too much strictness in these matters leads to a narrow spirit and ungenerous relations one towards another.

Mr. EDWARD BUXTON.—We cannot comply with your request.

To the Editor of the Medical Circular.

SIR,—I herewith beg to forward to you a copy of the 'Belfast Morning News,' of the 11th inst., in which you will observe a short letter, signed "MEDICUS," (a copy of the same has been forwarded to the Lord-Lieutenant of Ireland), in behalf of an unfortunate man, lately a respectable clerk I believe, in one of the Union Workhouses in the south of Ireland. He has been found guilty of poisoning his wife by means of strychnine. He was recommended to mercy by the jury who found him guilty, but on what grounds they did so, I know not, unless it was for his uniform previous good character. Neither do I know whether this man Burke be or be not actually guilty of the intended murder of his late wife. There is still some mystery it appears about the affair at all events; but as for the practice (or monomania), nowadays, of ignorant people taking upon themselves, to drug and doctor themselves (and their friends also), who can say when it will end, or what mischief they may do? Every respectable member of the Medical Profession ought to set his face at once against such a dangerous and baneful practice.

Antrim, August 14th, 1862. I am, &c., N. W. GREAV.

THE 'ORMSKIRK ADVERTISER' has been received; but came to hand too late to give us an opportunity to notice the Report this week.

A SUBSCRIBER.—The subject of "Diphtheria," is exhausted; we cannot promise.

L.S.A.—1st. No.—2nd. Of course. A licentiate being a registered practitioner, the College of Physicians would recognise the certificate.

Mr. WILSON.—Received.

Dr. ADAMS is thanked.

Royal College of Physicians
OF LONDON.

The next Preliminary Examination in the Subjects of GENERAL EDUCATION, will take place on the 23rd and 24th of SEPTEMBER.

Candidates are required to give fourteen days' notice in writing, to the Registrar of the College.

N.B.—The General Council of Medical Education and Registration, have recommended that no Student beginning Professional Study after September, 1861, be Registered, who has not passed an Arts Examination.

H. A. PITMAN,
Registrar.

Pallmall East, 1862.

Medical Officers wanted.

THE LONDON EQUITABLE MUTUAL LIFE INSURANCE SOCIETY,
64 CHANCERY LANE, LONDON, W.C.

Trustees:—Right Honourable T. E. HEADLAM, Q.C., M.P.; Colonel CLIFFORD, M.P., and H. F. JADIS, Esq., Board of Trade.

The Directors continue to pay the following highly liberal Fees, in addition to the usual commission, in all cases where Assurances are introduced directly by Medical Gentlemen—viz., 3*l.* 3s. where the Policy is for 500*l.*, 2*l.* 2s. for 200*l.* to 400*l.* and 1*l.* 1s. for 100*l.*

MEDICAL REFEREES REQUIRED where the Society is not represented,—remunerative terms allowed. Apply to Dr. GEORGE ROSS, 24 Farringdon street, London, or to
JOHN LESLIE PILKINGTON, F.S.S.,
Manager and Secretary.

Labels Cut by Machinery.—Adhesive for marking goods, 1s. per 1,000; Dispensing or Chemical, 2d. per 100, kept in stock; with Name and Address, 2s. per 1,000; Mixture, Pill, &c., equally moderate. An assortment of Labels for all trades. Contracts with large consumers.

J. CROSS, & SON, Engravers, Steam Machine Printers, Lithographers, and Stationers, 18 Holborn hill, E.C. Established 1813.

Chlorodyne.—R. Freeman, Pharmaceutist, Kennington road, London, S., informs the Profession and Trade that he has FOR YEARS MADE, and extensively supplied Chlorodyne—in one-ounce and four-ounce stoppered bottles, at 1s. 6d. and 5s. each. He guarantees it to be uniformly and properly prepared, and superior to any other makers', though their charge be ever so exorbitant; and he is glad to find that the low price at which he sells it allows the Profession to use it in common practice and at public Institutions, so that its extraordinary beneficial effects are enjoyed by the poorest sufferers. Sold by all Wholesale Druggists.

Plaster of Paris.—Stevens and SON'S superior Plaster, as fine and pure as originally prepared by them—packed in Tin—may be obtained of their successor, J. C. PART 186 Drury lane, London.

Cod Liver Olein, prepared by J. W. N. BREWER, Pharmaceutical Chemist, 5 Liverpool street, Finsbury circus.

This preparation is strongly recommended as containing all the active principles of Cod Liver Oil, without its impurities. Olein will be found to agree with the most delicate stomachs, and in those cases in which Pain, Nausea, or Eructations are produced by the Oil, the Olein is an invaluable substitute.

PHOSPHORIZED COD LIVER OLEIN;
THE SYRUPS OF THE HYPOPHOSPHITES AND BIPHOSPHATES, &c. &c.

List of Therapeutic and Special Preparations forwarded on application.

EXHIBITION PRIZE MEDAL, 1862.

FRY'S CHOCOLATE

FRY'S FRENCH CHOCOLATE for EATING, In Sticks and Drops.
FRY'S CHOCOLATE CREAMS.
FRY'S FRENCH CHOCOLATE IN CAKES.
J. S. FRY and SONS, Bristol and London.

MERIT ACKNOWLEDGED!

INTERNATIONAL EXHIBITION, 1862.

The Jurors of Class III have, after a searching series o analysis, awarded a

PRIZE MEDAL
for the "Purity and Excellence of Quality" of
WOTHERSPOON'S
VICTORIA LOZENGES,

Purchasers of which may rest assured that all are made of equal quality to those exhibited. They are flavoured with Peppermint, Cinnamon, Rose, Lemon, Musk, Lavender, Clove, and Ginger, and are to be had only in packets labelled 'Wotherspoon's Victoria Lozenges,' at 1d., 2d., 4d., 8d., and 1s. 4d. each, of all respectable Grocers, Confectioners, Druggists, &c.
WOTHERSPOON & CO., GLASGOW AND LONDON.

Liquor Carbonis Detergens, or CONCENTRATED ALCOHOLIC SOLUTION OF THE ACTIVE PRINCIPLES OF COAL TAR.—A new remedy in Cutaneous affections, etc., presenting in an elegant and effective form the several virtues of the Tar, which are held in solution by the Alcohol, and thus rendered applicable to all the purposes of Hygiene, Medicine, and Natural History. As a dressing for putrid sores, where a disinfectant is at the same time desirable, the Emulsion, formed of any required strength by the addition of water, is most readily exhibited, mere agitation producing immediately perfect combination.

Prepared at the Laboratory of WRIGHT, FRANCIS, and CO., Wholesale Druggists, 11 Old Fish street, London, E.C.; and may be obtained through any Chemist.—(Name and Label entered at Stationers' Hall.)

Aërated Lithia Water.—Messrs BLAKE, SANDFORD, and BLAKE are prepared to supply the LITHIA WATERS (of which they were the original manufacturers under Dr Garrod's instruction) of any strength prescribed by the Profession for special cases. Those in constant use contain two grains and five grains in each bottle, either by itself or combined with BICARBONATE of POTASH or PHOSPHATE of AMMONIA.—Also, Potash, Citrate of Potash, Soda, Seltzer, Vichy, and Mineral Acid Waters, as usual.

BLAKE, SANDFORD, and BLAKE Pharmaceutical Chemists, 47 Piccadilly.

American Remedies.—SAVORY & MOORE have received a valuable supply of the principal ALKALOIDS and FLUID EXTRACTS from the celebrated House of TILDEN & SONS, New York, whose preparations have been frequently alluded to in the articles upon Eclectic Medicines published in the 'Lancet.'

143 New Bond street, London.

Aloina.—The discoverers of this (vide 'Edinburgh Monthly Journal of Medical Science,' for Feb. 1851), the crystalline purgative principle of Aloes, continue to prepare and supply it. They have the gratification of knowing that the most eminent of the profession prescribe it, to the exclusion altogether of the various kinds of aloes.

Orders executed direct or through any Drug house, by T. and H. SMITH and CO., 69 Coleman street, London, and 21 Duke street, Edinburgh

Pepsine.—M. Boudault begs to state that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr PETER SQUIRE, her Majesty's Chemist, 277 Oxford street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on 'Pepsine,' with Remarks by English Physicians, edited by W. S. SQUIRE, Ph. D.; published by J. Churchill, London; may be also had of the Author, 277 Oxford street, price Sixpence.

ÆGLE MARMELOS, OR INDIAN BAEL.

Liquor Belæ, prepared from the unripe fruit, so much esteemed in cases of Diarrhœa, Dysentery, etc., also the Wine, Extract, Powder, and Preserve.

Descriptive accounts may be had on application to the Importer gratis
O. GOULD, CHEMIST, 198 OXFORD STREET, LONDON.

Established 1812.

H. Potter's Depot for his CELEBRATED LEECHES, TURKEY and other SPONGES, MEDICAL HERBS, &c., 65 FARRINGDON STREET, London, E. C.

For price and quality they cannot be excelled.
Priced Catalogues free to any address.

JOURNAL

OF

Practical Medicine and Surgery.

ART. 6272.

LEARNED SOCIETIES.

ACADEMY OF SCIENCES.—In most cases of hydrocele, there is little difficulty in ascertaining the situation of the testicle; but, in some instances, the transparency is so uniform, and pressure with the fingers yields so doubtful information, that puncture of the tunica vaginalis cannot be performed without some risk of injuring the spermatic gland. Mr. Marcelin Duval, Director of Naval Hospitals at Toulon, who in no less than sixty-seven cases has met with the embarrassing conditions alluded to, forwarded to the Academy of Sciences the description of a mode of operation which ensures the perfect safety of the testis.

At the lower and outer part of the tumour, a horizontal fold of the skin is divided perpendicularly, in an extent sufficient to admit of the penetration of the trochar, which is gently inserted outward and upward into the tunica vaginalis. The blade is then withdrawn into the canula, and the latter is pushed upward in a direction nearly parallel to the axis of the body, inclining slightly to the external part of the tumour. Iodine, wine, &c., are then injected as usual.

— Mr. Ch. Ozanam then read a paper in which he endeavoured to demonstrate the efficacy and innocuity of carbonic acid as an anæsthetic.

"I had recently" said he "to open a deep-seated abscess in the thigh; the patient was a young man, and in order to induce insensibility to pain, I used a mixture of three parts of carbonic acid with one of atmospheric air, included in an india-rubber bag, of a capacity of about 24 quarts.

"The bag was supplied with a long, flexible tube, terminating in a mouth-piece, which was held at a sufficient distance from the face to admit of a certain proportion of air being simultaneously inhaled.

"Anæsthesia followed in the course of about two minutes, and was attended with two notable phenomena—viz., the acceleration of the breathing, and copious perspiration on the face. The operation was painless, with the exception of the last incision, which was indistinctly felt, and the patient immediately returned to consciousness."

— We recorded in the first part of our present number, our impressions on the subject of Mr. Beau's paper, relative to the influence of tobacco-smoke on the production of angina pectoris. The following are the facts on which the author grounds his opinion:

1. A gentleman, aged about sixty, in the habit of smoking to excess, frequently suffered at night for a month from palpitation of the heart, oppression, and pain in the shoulders. He discontinued smoking, and the attacks entirely ceased, the digestive functions becoming at the same time more regular. After three months, he resumed his old habits, and again experienced the same symptoms. At last he completely eschewed tobacco, and no further return of the attacks has since taken place.

2. A physician, aged fifty, who, although presenting the outward signs of health, was troubled with dyspepsia, and consequent debility, indulged in the use of *cigarettes* whenever the opportunity offered. For some time, he complained of palpitations accompanied by oppression and a sense of tightness about the chest, recurring in paroxysms at various hours of the day or night. He gave up smoking, and the attacks ceased. One day he found himself in the same room with several smokers, and, although he did not yield to temptation, he inhaled the fumes of tobacco, and on the following night the former symptoms returned.

3. A physician, aged thirty-five, who practises in the country, incessantly smoked cigarettes in the intervals of his professional visits. For a long time his appetite had declined, and he consequently took very little food. One morning, while fasting, and smoking a cigarette on his way to one of his patients, he was suddenly seized with precordial anxiety, and tightness across the upper part of the chest. He was unable to speak or walk; his pulse became insensible, and his hands cold. These symptoms lasted half an hour. He came to Paris, and, by Mr. Beau's advice, relinquished the habit of smoking, promising to write if a paroxysm of the same nature as the first again reappeared. Mr. Beau has not heard from him since.

4. A young Spaniard, aged thirty, in the constant habit of smoking cigarettes, suffered much from dyspepsia and impaired digestion. One evening, while indulging in his customary relaxation, he suddenly experienced violent constriction of the chest, and for ten minutes his pulse was imperceptible. Alarmed at this occurrence, he greatly diminished his daily consumption of tobacco, and the symptoms of angina have not since returned.

5. A physician who has been compelled to discontinue the practice of smoking on account of disturbance of the gastric functions, also experienced, when he was in the habit of using tobacco, nocturnal attacks of tightness of the throat, with palpitation and neuralgic pains in the neck. He now enjoys perfect freedom from these symptoms.

6. A merchant who for fifteen or twenty years had suffered from dyspepsia consequent on immoderate smoking of cigarettes, suffers, chiefly at night, from paroxysms of precordial oppression, with palpitation and pain between the shoulders. The features are drawn, and the pulse small and irregular. This gentleman now smokes more than ever.

7. A healthy and vigorous old man, aged seventy-five, seeks consolation in smoking from mental distress. On a Saturday an attack of angina supervenes, of half an hour's duration; a second fit recurs next day, and he is found dead in his bed on the Monday morning.

8. A foreign diplomatic agent, an inveterate smoker, who, despite appearances, was of weak constitution, was seized one evening, on his return home, with angina pectoris, characterised by dyspnœa, smallness of the pulse, refrigeration of the extremities, and lividity of the integument. He went to sleep at eleven o'clock, awoke next morning at his customary hour, and transacted business as usual. At five o'clock, while smoking a cigar in his arm-chair, he suddenly expired. A fatty condition of the heart was the only alteration detected at the post-mortem examination.

ACADEMY OF MEDICINE.—Our readers have doubtless not forgotten Mr. Réveil's memoir on the necessity of preventing the sale of dangerous cosmetics. Mr. Trébuchet, at the conclusion of his report on this paper, proposed the following resolutions:—

1. To present to Mr. Réveil the thanks of the Academy for his important communication. 2. To forward his paper to the publishing committee. 3. To transmit a copy to the Minister, calling his attention, at the same time, to the various propositions and remarks contained in the memoir. 4. To request his Excellency, in addition to the measures which a perusal of Mr. Réveil's paper, and of the present report, may suggest, to cause the shops and laboratories of perfumers to be regularly visited, from time to time, by delegates from the School of Pharmacy, or the Board of Health, in order to select and examine specimens of the different cosmetics exposed for sale, and to compel dealers in such articles to annex a label to each, stating that it contains no poisonous or injurious ingredient.

One member only objected to the last clause. Mr. H. Bouley could not admit that the cosmetics so violently denounced by Messrs. Réveil and Trébuchet constitute a danger to the public. It is not the majority of the population who make such frequent use of pomades, cosmetics, and scented waters. The purchasers are chiefly middle-aged coquettes, superannuated dandies, and the uninteresting class of disorderly women whose beauty vice has prematurely tarnished. Mr. Bouley therefore saw no adequate motives to interfere vexa-

tiously with the perfumers' trade by an unnecessary display of authority. Must we also, did he ask, have Government-stamped corsets and shoes, as we appear likely to have Government-stamped pomades, powders, and elixirs? It was a dangerous thing to trammel commerce and shackle liberty of trade. If some persons had been injured by the use of cosmetics, they should apply for a remedy to the tribunals, on the strength of Art. 1,382 of the Civil Code.

Mr. Trébuchet had also denounced the too often deceitful advertisements which fill up the pages of the political papers, and of many Medical journals. The learned reporter recommends, that the authors of such advertisements be severely prosecuted. Mr. Bouley could not assent to this course; the liberty of the press was already but too much fettered under present circumstances. In conclusion, he would vote against the last resolution, although approving, of course, of the scientific part of Mr. Trébuchet's report.

After Mr. Bouley, Messrs. Gaultier de Claubry, Boudet Poggiale, and Chevallier, addressed the Academy on the same subject.

In France, said Mr. G. de Claubry, Government watches over public salubrity, and protects the health of all members of society. This protection has become a part of our institutions, and, therefore, the administration would only perform one of its habitual functions, in prohibiting the fabrication and sale of all dangerous substances. But there were laws and regulations applicable to the subject, as well as to advertisements of every description, and it would be sufficient to point out to the authorities, the necessity of applying them a little more strictly.

Mr. Boudet expatiated on the services rendered to public salubrity by the Board of Health. Thanks to its intervention, the use of mineral colours had been prohibited, in the fabrication of sweet-meats, wafers, paper, and artificial flowers, to the great advantage of the working classes and of the population in general. It would, therefore, be highly expedient to appoint special inspectors of the preparations used by perfumers, and this measure would avert the dangers indicated by Mr. Réveil, which interested a much greater number of persons than Mr. Bouley appeared to think.

Messrs. Poggiale and Bussy, especially the former, inveighed with much energy, against the advertisements daily recommending to the public certain medicines, and patent remedies. It is time, said Mr. Poggiale, to call down upon the puffings of quackery, the full rigour of the law, and also on the secret remedies and self-dubbed panaceas, extolled in the advertisement-sheet of newspapers, but neither to be found in the Codex, nor noticed by the Academy of Medicine. It is a stringent duty devolving on the Academy to denounce these abuses, which are far more injurious than the sale of mere cosmetics.

Mr. Poggiale, therefore, moved as a new resolution, that an address drawn up by a special committee, be forwarded to the Secretary of State on this subject. This motion was powerfully seconded, and after passing before the Administrative Council of the Academy, will be brought forward at an early meeting.

In the interim, the Academy voted separately on the two paragraphs of Mr. Trébuchet's fourth resolution. The first was adopted, the second—*i. e.* (compel dealers in such articles to annex a label, &c.), was rejected. Of course the first three resolutions were unanimously carried.

BIBLIOGRAPHY.

Art. 6273. *De la Thrombose et de l'Embolie Cérébrales considérées principalement dans leurs Rapports avec le Ramollissement du Cerveau* (Cerebral Thrombus and Emboli, chiefly viewed in their connection with Softening of the Brain), by — *Lancereaux, M.D.* (a)

The question of emboli, recently brought before the Academy of Sciences, by a learned Professor, still engages a large share of the attention of pathologists. Elements of varying nature may, perhaps, occasionally enter into the composition of these erratic concretions, but coagulated fibrin is by far their most common constituent. The great frequency of emboli is now an undisputed fact, and when we reflect on the manifold morbid circumstances which may give rise to coagulation of the blood, we are only surprised that they are not more common. The nature and severity of the occurrence must, however, vary in an easily intelligible manner, according to the size, shape, and degree of consistency of the concretions; to the number, kind, and importance of the obstructed blood-vessels; and to the functions of the organs to which such vessels are distributed: hence a series of ever-varying disturbances and anatomical changes, the study of which must lead to fruitful inquiry.

These remarks are fully borne out, if they required demonstration, by a perusal of the present volume, in which Dr. Lancereaux endeavours to throw light on the share of embolus in the production of softening of the brain.

At a comparatively recent date softening was exclusively referred to inflammatory action; and we cannot forget the difficulties Mr. Rostan's theory of the influence of senility on its production had to contend with, when first mooted in opposition to the doctrines held at the period by the most eminent pathologists. This shrewd observer, comparing softening of the brain to gangrene, opined that it was frequently the result of ossification of the arteries, and of subsequent vascular obstruction—a view which was soon confirmed by many publications both in France and abroad (Abercrombie, Bright, Gendrin, Cruveilhier, Bouchut, &c.) Virchow, however, was the first who distinctly asserted that the disease has its origin in embolus. Our clinical wards now teem with cases illustrative of the fact; they are the occasion of luminous interpretation, and from the assemblage of the instances recorded by various writers, combined with those which have fallen under his own observation, Dr. Lancereaux has compounded the memoir now offered to the public.

The author, evidently well versed in the minutest proceedings of modern inquiry, applies them to the demonstration of the connection in many instances observable between occlusion of the vascular system of the brain and certain softenings of that viscus, hitherto erroneously viewed as idiopathic.

The work is divided into three sections. The first treats of thrombus and emboli of the arteries of the encephalon. The chapter devoted to anatomical and physiological considerations reveals a master-mind, and points out—1. The anatomical conditions attendant on arterial obstruction resulting from the two causes alluded to; 2. The changes consequent on occlusion; 3. And the lesions produced by the same agency at a distance from the brain, in the heart, viscera, and extremities. The passages referring to the pathology of softening, and to the organic changes induced by the obstruction, are especially deserving of notice.

These are not, however, the sole causes of ramollissement. The pathogenic agencies are classed by the author under four heads—viz., vascular obstruction, inflammation, plastic deposits, and mechanical operation (tumours, hæmorrhagic coagula, &c.) Amongst the cases of the first class, he lays peculiar stress on arteritis and endocarditis, which often give rise to fibrinous, calcareous, or warty formations; also rheumatic fever, aneurism of the arteries of the neck, &c.

Treatment is, of course, of small avail in diseases of this description. When the presence of valvular disease of the heart suggests a fear of the formation of emboli, the first indication is to prescribe perfect repose. In aneurism of the neck, all pressure should be avoided, and digitalis be exhibited for the purpose of keeping the action of the heart within moderate bounds, and preventing the rupture of the coagulum within the aneurism. When the embolus has formed, it is proper to contend with local congestion by counter-irritants and unfrequent blood-letting. The necessity of great caution and reserve in this latter respect, arises from the obviously unfavourable tendency of any debilitating measures, and from the increased power of coagulation, and, consequently, the greater facility for the formation of thrombus, which would be imparted to the blood by the abstraction of its corpuscles.

If the embolus is of fibrinous nature, it would appear rational to prescribe alkaline remedies. In support of the

(a) 4to. Adrien Delahaye, Paris.

advantages which the author expects from the administration of this class of medicines, we may add that they are recommended by Sénac (*Traité du Cœur*), and have been found useful by Mr. Legroux in cases of polypous concretion, situated within the heart. Dr. Philippe has also recorded the very interesting case of a soldier, in the Toulon Hospital, who was cured by the exhibition of alkaline drugs of an enormous œdematous tumefaction of the left hand and forearm. In this instance the swelling had been regarded as the result of the occlusion of the principal vein of the extremity by a fibrinous concretion, and various treatments had previously been resorted to without success. (*Vide* 'Mémoires de Médecine et de Pharmacie Militaires,' Vol. LIV.; page 285.

In the second section of his memoir, Dr. Lancereaux follows the embolus into the parenchyma of the brain, and endeavours to descry the nature of the changes induced in that viscus by its presence. Here the microscope is in constant requisition, and although, from their nature, these researches cannot present an absolute degree of precision, yet their ingeniousness entitles them to the highest commendation.

In the third section of the work, the author treats of thrombus of the cerebral sinuses, and his remarks on the subject may be thus summarised :—"Inflammatory thrombus or phlebitis of the sinuses, and genuine thrombus of these vascular passages differ from each other in their nature and in their symptoms. The former is frequently connected with puriform inflammation, which is never observed in the latter; softening due to emboli is chiefly the result of simple thrombus, and here again appears to be merely the consequence of mechanical obstruction."

This brief analysis can assuredly convey but a faint idea of Dr. Lancereaux's interesting publication, but we trust it may induce in some of our readers a desire to peruse the most complete monograph we have hitherto met with on this very important subject. We shall take an early occasion of adverting to a no less valuable paper, by Mr. Benjamin Ball, on pulmonary embolus.

VICTOR MARTIN, M.D.,
Chief Physician of Naval Hospitals.

ART. 6274.—*Traite Thérapeutique des Eaux Minérales de France et de l'Etranger, et de leur emploi dans les Maladies Chroniques* (French and Foreign Mineral Waters, and their Application to the Cure of Chronic Disease), *by Mr. Durand Fardel, M.D. (a).—Des Effets des Eaux Thermales du Mont Dore dans le Traitement du Coryza et de l'Aphonie* (the Efficacy of the Thermal Waters of Mont Dore, in Coryza and Aphony) *by T. Mascarel, M.D., Physician-in-Chief of the Hospital of Châtellerault (b). — Etudes Médicales sur le Mont Dore. Quatrième Mémoire: Observations Médicales, 1ère Série; Observations de Catarrhe Pulmonaire, de Catarrhe Intestinal et de Catarrhe Uterin, Traités Parles Eaux du Mont Dore* (A Medical Inquiry on the Springs of Mont Dore, being a record of cases; 1st. Series: Cases of Pulmonary, Intestinal, and Uterine Catarrh, treated by the Waters of Mont Dore), *by G. Richelot, Consulting-Physician at Mont Dore (c).*

Mr. Durand Fardel's volume, a second edition of which is now presented to the public, was originally intended as a mere reproduction of the lectures delivered by the author, at the *Ecole Pratique*. But the magnitude of the subject has compelled the Professor to widen the circle in which he was at first desirous of confining his observations, and the work has thus assumed proportions unsuited to verbal lectures.

Instead of presenting a description of each mineral water in succession, a plan which has greatly detracted from the utility of even the best treatises on the matter, Mr. Durand Fardel applies to the study of mineral waters the same method which governs other therapeutic inquiries. The system adopted by the author, consists in presenting a synoptical view of the mineral waters, and of the indications they are intended to meet, from which may be readily inferred the rules of their application; he then enters into a comparative study of the mode of action of the various springs; this appears the only arrangement of the subject calculated to invest hydrology with the character of utility we expect to find in the other resources of practical medicine.

We are especially struck in this work with the simplifications introduced into the apparently intricate study of mineral waters. Mr. Durand Fardel shows that these numerous spas, a mere catalogue of which would form a list sufficiently extensive to alarm the most laborious observer, may in reality be reduced to a proportionately short enumeration of chemical standards and Medical applications. If we take as an instance the chemical classification of mineral springs, we find that *Enghien, Eaux Bonnes, Cauterets, Luchon, Barèges, Saint-Sauveur, Aix* (Savoy), satisfy every requirement of sulphurous treatment. At one or two of these establishments—*e. g., Luchon* or *Aix*, in the Département de l'Arriège, a number of springs of different strength and heat are to be met with, sufficient for every purpose of medicine. If, on the contrary, we consider therapeutical applications, we find in Mr. Durand Fardel's volume, that catarrhal and bronchial affections of every description are benefited at *Enghien, Eaux Bonnes, Cauterets, Mont Dore, Ems*, &c.; with regard to rheumatism, which requires the use of thermal waters, it is equally certain that all the resources needed by the physician are amply supplied at *Néris, Bourbonne, Bourbon-Larchambault, Aix in Savoy*, and *Barèges*.

We have quoted Mont Dore as appropriate to the cure of catarrhal forms of disease. Two physicians, practising at this residence, Messrs. Mascarel (of Châtellerault), and G. Richelot (of Paris), again invite the attention of the Profession to the effects of the warm springs of Mont Dore, in coryza, aphonia, chronic bronchitis, obstinate diarrhœa, and uterine catarrh.

Mr. Richelot, who adduces numerous cases in support of his statements, remarks that, under the influence of these waters, the pulse diminishes in frequency, and that more refreshing sleep, increased appetite, more active digestion, and general improvement of vital power follow their use. He shows the utility of the Mont Dore Spas in chronic catarrhal disease, and in morbid conditions of the mucous membranes, especially when attended with impaired digestion, and general debility of the system.

ART. 6275.

MISCELLANEA.

— The Imperial Academy of Sciences of Caen has offered a prize of 80*l.* for the best essay "On the Functions of Leaves in the Vegetation of Plants." Candidates must send in their essays to Mr. Travers, Secretary of the Academy, before the 1st of January, 1865, each paper to be distinguished by an epigraph, and accompanied by a sealed letter, containing the author's name.

— At the meeting of the Academy of Medicine of June 24th, Mr. Nélaton exhibited an ovarian tumour, removed a week before from a woman aged twenty-six.

The operation was performed on June 17, at Mr. Duval's house at Neuilly. The growth was exposed by an incision extending from the umbilicus to the pubes, firmly secured, and its protruding part punctured with a trochar. The numerous attachments of the mass were torn asunder, and the pedicle was at once seized with the clamp, and divided. Several small arteries were tied, and the liquids which had collected at the back of the uterus were carefully removed with a sponge. The wound was closed by seven metallic ligatures, including the peritoneum. The patient, while still under the influence of chloroform, was then wrapped up in warm blankets, and conveyed back to her bed.

During the hour which followed the operation, she complained of cold; she vomited, experienced paroxysms of pain, but without tympanitic enlargement of the abdomen, and her pulse rose to 96. An enema containing laudanum, and iced applications were prescribed. The same symptoms recurred

on the second day, but the pulse fell to 88. On the third day, hiccup was noticed, but yielded to a blister over the epigastric region. From this date, amendment set in; the pulse fell to 76, the clamp was removed on the fourth day, and cold beef-tea was allowed. On the fifth day, the pulse further decreased to 66, five ligatures were withdrawn, and as no motions had yet taken place, a dose of castor-oil was exhibited. The bowels were copiously relieved on the sixth day, when the sixth metallic suture was removed. On the seventh day, the menses appeared; the remaining ligature fell away, and soup and eggs were prescribed. On the eighth day, the pulse being 62, soup and a mutton chop were permitted. The condition of the patient is in every respect satisfactory, and the wound has united in its entire extent.

The above is a brief account of the case. The operation was one of no ordinary difficulty; the tumour was larger than the head of a full-grown adult, and contained about eight quarts of fluid in several separate cysts. The woman was, moreover, exhausted by protracted suffering, numerous adhesions were present, and yet a rapid cure was effected, despite the especially unfavourable influence but recently attributed to the climate of Paris over the results of this operative procedure.

This is the first instance of success of ovariotomy in France, and no publication could more opportunely appear than the pamphlet recently edited by Ad. Delahaye—*Ovarian Cysts and Ovariotomy performed according to the method of Dr. Baker Brown*, by Dr. Labalbary.

The author has dedicated his work to Messrs. Baker Brown and Nélaton. This was but just. Mr. Labalbary foresaw, but could not record the success which awaited the French Professor. His object has been to place before his countrymen, in imitation of Mr. Worms, a carefully-compounded history of ovarian cysts, together with the rules of treatment of the disease in England, and more especially to promulgate the *modus operandi* adopted by Mr. Baker Brown.

— Dr. A. Ehrmann, First-Class Medical Inspector, who accompanied the French army to Mexico in February, has been appointed Chief Physician of the Expeditionary Force, *vice* Mr. Ludger-Lallemand, deceased.

Further Discoveries of Flint Implements in the Drift.—In the last published volume of the "Archæologia," John Evans, Esq., F.G.S., F.S.A., gives a paper on the above subject. Flint implements have been found in the Champ de Mars, Paris, at Clichy, and in the Rue de Grenelle, in beds of sand and gravel analogous to those of Menchecourt, near Abbeville; the beds are not disturbed, their average thickness is 20 feet. The implements and flint-flakes were found in a bed at the base of the gravel, from 3 to 5 inches in thickness, associated with bones of *Bos primigenius Elephas primigenius*, deer allied to reindeer, and a large carnivorous animal, probably cave-tiger. These observations have been confirmed by M. Lartet and Mr. Mylne. An implement has also been found, under similar circumstances, in the gravel-pit at Précy, near Creil, in the valley of the Oise (between Amiens and Paris), with a tooth of an elephant. At Clermont, near the Ariege, there is a deposit of gravel underlying brick-earth, at 540 feet above sea-level, and 33 feet above the stream which now waters the valley. In this gravel, mixed with bones of *Elephas primigenius, Rhinoceros tichorhinus, Felis spelæa, Cervus megaceros Equus*, and *Bos*, have been found manufactured "pieces quartzite." Mr. Evans has picked up, at Swalecliffe, a flint implement; whilst Mr. R. Whitbourn, F.S.A., and Mr. Whittaker, of the Geological Survey, have obtained examples from Peasemarsh, in Surrey, and Horton Kirby, in Kent. Mr. Evans adheres to his original classification of these implements into, 1, flakes; 2, weapons with an acute or rounded points; 3, oval or almond-shaped implements, with a cutting edge all round. He gives a plate of twenty examples, drawn to a scale of one-half linear, as well as figures of the implements from the Valley of the Oise, Swalecliffe, and Reculver. With respect to the human remains found in cave deposits he says:—"The doubts which have been thrown upon the cavern evidence, bearing on the contemporaneity of man with the extinct mammals, are now in a great degree dispelled by similar discoveries having been made under circumstances which preclude the interference of those causes of error which come within the bounds of possibility in the case of caverns. The series of facts brought forward by careful investigators of the ossiferous caves in all countries, have, therefore, a right to a new trial at the hands of scientific inquiries, in which, probably, the verdict that has already been pronounced against them will, on the admission of this fresh corroborative testimony, be set aside."

The Medical Circular.

REVIEW OF THE PERIODICALS.

The 'Dublin Quarterly Journal of Medical Science.' Dr. Henry Thorp contributes a paper on *Pleuritic Effusions*, in which an account is given of two cases in which thoracentesis was successfully performed, although one of the patients subsequently died of congestion of lung. There are some interesting points in the first case. We extract the following:—

"At my next visit the patient's condition was all but hopeless; there was orthopnea, a rapid vermicular pulse, hurried breathing, moist skin, copious, fetid, purulent sputa, countenance dusky, and strength rapidly failing. Thoracentesis was now the only alternative left me, and I immediately performed it. Drawing the skin a little to one side, I pushed a trocar steadily through the sixth intercostal space, a short distance behind and below the nipple, keeping the instrument close to the upper edge of the rib below. Upon its withdrawal, a stream of abominably fetid, viscid, greyish-yellow, purulent matter issued, *per saltem*, or rather in a periodically accelerated current, through the canula—the quantity discharged in this manner measured about a pint—when I withdrew the tube, and dilated the opening freely with a probe-pointed bistoury, so as to obtain a free and continued vent for the contents of the cavity. The patient, to whom stimulants were freely administered, bore the operation well; and expressed himself, shortly afterwards, as being greatly relieved. A poultice was applied over the opening, and he was directed to lie as much as possible on the left side.

"The subsequent history of the case is easily told. It was one of gradual, but uninterrupted recovery. The patient rallied, his strength increased, the cough became less harrassing, and the exhausting expectorations and sweats declined from day to day; the opening remained fistulous, and continued to discharge for several months; gradually, as the cavity emptied itself, the heart moved from right to left into its normal position. At no time, either previous or subsequent to the operation, was I able to recognise the ordinary phenomena of pneumothorax—namely, succession, metallic tinkling, or amphoric respiration. It is scarcely necessary to state that the strength of the patient was sustained by the free use of tonics, stimulants, and animal food. He now enjoys excellent health. I examined his side a few days ago; it is very slightly contracted; on percussion it is scarcely so resonant as the opposite; nor is the respiratory murmur so loud; but there is no marked alteration in its physical condition, such as we are accustomed to meet with as a consequence of suppurative pleurisy.

"Apart from the successful result of thoracentesis, the foregoing case presents features of very unusual interest. Pulsation has often been observed in cases of 'empyema of necessity;' and a valuable paper on the subject was published some years ago in this journal, by Dr. M'Donnel. A throbbing of the lung, in certain cases of pneumonic consolidation, was noticed by Laennec; and a unique case of pulsating pneumonia, attended with *bruit de soufflet*, is given by Graves in his 'Clinical Medicine.' Cases, however, of throbbing empyema such as the foregoing, unattended with perforation of the costal pleura, and accumulation of pus under the skin, must be exceedingly rare. Walshe, indeed, has twice seen cases of this description, and refers to them in his recent work on 'Diseases of the Lungs and Heart.' What, it may be asked, are the conditions necessary to the production of pulsation in the exceptional cases of pleural effusions in which it occurs? Or, why is it that the stroke of the heart is communicated to some fluid collections and not to others? In most of the cases in which it has been observed, the impulse was strong, diastolic, and heaving, like that of an aneurism; from which it may be inferred that the empyema was so circumstanced as to be subject to the well-known hydrodynamical law of the propagation of pressure through fluid bodies. Now, if we suppose an empyema to be encysted, or closely pent up by adhesive matter, and that the contained fluid, without the interposition of yielding long substance, comes into direct relation with the mediastinum internally, and the chest-wall on the outside, we have all the conditions furnished for supplying the phenomena of pulsation.

"I believe the case just detailed to have been an interlobar encysted empyema, for the following reasons:—1. Although, in the first instance, the effusion occupied the general pleural cavity, as indicated by the physical signs, at a later period respiration was distinctly heard postero-inferiorly, at a time when it was totally absent higher up over the area of pulsation. 2. There was no depression of the diaphragm or spleen. 3. The attack was not followed by contraction of the side, immobility of ribs, curvature of spine, or concentric displacement of organs. 4. The pulsation corresponded to the line of the interlobar fissure. 5. The fluid discharged was viscid, as it were from admixture of mucus. In connection with this latter fact it is important to remark that at no

time previous to the operation were the phenomena of pneumothorax to be observed. This I am certain of, from careful and often-repeated examinations. There was consequently no direct communication between the cavity of the abscess and the bronchial ramifications; still the fluid resembled a mixture of pus and mucus. We can only account for this fact by a reference to the laws that determine the mutual diffusion of fluids of different densities when separated by moist membranes or porous substances. If the matter lay, where I believe it did, in the fissure between the two pulmonary lobes, it was surrounded on all sides by lung-substance, and necessarily brought into close relation with numerous bronchi, between the contents of which and the interlobar collection an *exosmose* and *endosmose* might with facility occur. The patient, for several days previous to the operation, coughed up large quantities of purulent matter; and had his strength withstood the effort, and the urgency of the symptoms not called for the artificial evacuation of the collection, the latter might have been eliminated without surgical assistance. This spontaneous cure of empyema has often been referred to a so-called 'vicarious action' of the bronchial mucous membrane. Does not this case afford a clue to the precise nature of the process; and may we not (preferring the expression of a philosophical fact to the use of a metaphor) more appropriately attribute the result to the operation of the physical law just referred to? Thus, then, the pyogenic sac was interlobar, and extended transversely across the great pulmonary fissure, coming into close proximity centrically with the heart, and externally with the chest-wall; and its contents forming a continuous fluid column, received and propagated outwards the cardiac pulsation, after the manner of an aneurism."

The author discusses the alleged injurious influence of the admission of atmospheric air, and observes upon it—

"That atmospheric air itself exerts no irritating influence on the tissues of the body is rendered pretty evident by the phenomena of general emphysema, as also of simple pneumothorax, whether traumatic or occurring as a consequence of rupture of a dilated air vesicle; although the cellular tissue of the body may be inflated so as to resemble a 'stuffed skin,' and the pleura distended almost to bursting, no erethism or reactive inflammation is the consequence of the lesion. But that atmospheric air, on some occasions, does exert a deleterious effect is unquestionable; but it so acts, not by reason of its stimulating properties, but simply because it supplies one of the conditions under which putrefaction of purulent and other fluids is likely to occur. Not that its presence is invariably followed by the chemical change in question. Laennec gives the case of a patient affected with broncho-pleural fistula, who for six years exhibited the signs of hydro-pneumo-thorax without either local or constitutional distress. Louis, and various other physicians, have witnessed similar instances. In truth, the precise conditions under which putrefactive changes are generated in the pleura have yet to be determined; insomuch so that we are forced to admit, in addition to the acknowledged influence of heat and air, the presence of some unknown agent or state which disposes the fluid contents to undergo catalytic changes—or how explain the cause of the latter not taking place in the cases just referred to? Enough, however, is known to warrant the exercise of great caution in performing paracentesis so as to prevent the ingress of atmospheric air in certain pleuritic effusions of the non-suppurative class; whereas purulent collections in the cavity of the chest should form, in my opinion, no exception to the ordinary manner of dealing with similar diseases elsewhere."

In fine, Dr. Thorp would apply the ordinary rule to empyemic collections, and discharge them by puncture; but, he says, the opening should be made anteriorly, and high up, in imitation of Nature's ways, remarking:—

"Nature then indicates these positions as being the most eligible by her own operations. Nor is the object of her method obscure or unintelligible. By causing the liquid contents to proceed from below upwards she guards against the sudden evacuation of a cavity (and consequent entrance and *imprisonment* of atmospheric air in proportionate volume) the walls of which can only approximate by slow degrees; thus the suppurating sac is emptied gradually by its own contraction; and the air, which can only enter in small quantity, has *free egress*, being *always uppermost*, and in close proximity with the discharging orifice. We should, therefore, in conformity with these principles, not open the chest in a depending position; for if, unfortunately, afterwards putrefactive changes take place, the septic gases floating above the other contents *have no exit*, are absorbed by the lining membrane of the cavity, excite inflammation of the latter, contaminate the blood, and produce typhoid symptoms. To prevent, then, putrid absorption, and its concomitant evils, let the empyema be opened above—that is to say (when the case admits of our doing so), between the fourth and fifth ribs, anteriorly, and provide, if necessary, for the constant drainage of the abscess by the introduction of a Chassaignac's tube.

"In cases, however, of hydrothorax, or sero-albuminous, sero-sanguineous, and passive collections in the pleural sac our operative proceedings should be guided by very different principles. In pyothorax a pyogenic membrane is already formed, and matter is making its way to the surface; by evacuating the collection we only complete an operation already commenced. But the other class of effusions referred to are very differently circumstanced; they are not included in an adventitious sac, or newly-organised membrane, but lie in contact with the serous surface in a healthy condition, or only slightly altered in anatomical structure and vital endowments; the fluid evinces no tendency to reach the surface; if it disappear it is directly absorbed from the serous cavity, and is never evacuated externally without having previously undergone more or less of purulent metamorphosis. Therefore we should endeavour, in dealing with these immature collections, to avoid all causes of irritation, and to prevent, by all means in our power, the higher or suppurative grade of action not yet attained under existing conditions; in short, we should make the practice of art approach as closely as possible to nature's own operations, and not proceed in untimely advance of them. Accordingly the fluid ought, only in the first instance, to be partially withdrawn; the remainder may be absorbed into the system; if not, the tapping may be repeated. Valvular perforation of the integuments and the employment of a vulcanised india-rubber bag and stopcock, or the ingenious trocar and canula invented by Mr. Charles R. Thompson, will effectually prevent the entrance of atmospheric air.

"By proceeding in this manner we do not overstrain the vital processes of the economy in their progress towards the restoration of health, but only disencumber them of impediments that check their free action, and, with full confidence in her resources, leave Nature to complete the cure by the continuance of her own efforts.

"We first endeavour to comprehend the purposes and *modus operandi* of the *vis medicatrix*, and then follow faithfully in the path, without seeking, by premature interference, to reverse the natural order of pathological events, or force upon her contingencies for which she is as yet unprepared. In conducting the two cases which form the groundwork of this communication to a favourable termination I was guided by the principles just enunciated."

Dr. Neligan contributes to the same journal notes of an *Unusual Abnormal Condition of the Mucous Membrane of the Tongue and Cheeks*, considered in connection with life assurance. The peculiarity is thus stated in the form of an extract from a report to a life office:—

"In giving my opinion on the life, I stated, that as regards his present health it was good; as to the state of the different organs, they were healthy, but the tongue was singularly affected, the natural membrane covering it and the inside of the cheeks being changed into a thick white skin, like a kid glove, and uneven on the surface; as to his constitution, that it appeared to be sound; and, as to the eligibility of the life for assurance, that it would be a first-class life were it not for the state of the tongue, which I had never seen anything like before, nor could the proposer assign any cause for it; he said that it had been so for the last thirty years, that his taste was as perfect as that of any other person, nor had he any soreness or uncomfortable feel in it. I concluded my opinion by adding that in the case of so singular an affection I would advise an extra rate of five or seven years to be charged.

"The condition of the mucous membrane of the tongue and inside of the cheeks here alluded to was very remarkable. The tongue was perfectly clean—that is to say, there was no fur on it, nothing that could be removed by scraping or washing; it was of a dead white colour, resembling, perhaps, rather the appearance of the surface of the tongue in a boiled calf's head than a kid-skin glove, the lustre of which it wanted; it was uneven on the surface, but not wrinkled or fissured, nor presenting the papillated character of the organ in its normal state, there was more a general unevenness. The same condition existed in the mucous membrane lining the cheeks, and the gums in contact with them, but the covering was evidently less thick; the roof of the mouth, the palate, the throat, the tonsils, and the uvula were quite natural in appearance. There was no unnatural dryness or change of temperature of the mouth; the salivary secretion was abundant, the gustatory powers perfect, described by the gentlemen himself as being unusually sensitive, and the speech was in no way affected. On closely questioning him, he stated that he noticed this change when he was about eighteen or nineteen years of age, and that it then was just as complete as when I examined him. He thought when he first discovered it that it must have been caused by a habit he had of indulging in smoking to excess, and always smoking the tobacco in the shortest possible pipe, so as to get the smoke into his mouth as hot as he was able to bear it.

Several assurances were subsequently affected, but about two years from the time of the first assurance he bit his tongue, and Dr. Neligan remarks:—

"It seems that, as the result of this bite, a small tubercle, about the size of a pea, formed on the edge of the tongue, beneath t

mucous membrane, its situation being on a level with the molar teeth. For this he sought the advice of some of our eminent surgeons, who differed in opinion as to the necessity of an operation; the result being that he placed himself under the care of one of them who treated the disease with caustic applications. After some time, however, hæmorrhage set in, necessitating an operation, which he survived only a few months, cancer having invaded the glands in the neck.

"As I have already said, my object in recording this case is to call attention to the existence of, I believe, a hitherto undiscovered abnormal condition of the mucous membrane of the tongue and cheeks; to show the probability of its terminating in a cancer; and, as a necessary conclusion, to point out that such a deviation from the natural state of these parts would render a life ineligible for assurance."

An article *On Certain Movements of the Throat and Chest in Respiratory Acts*, by Dr. Edward Smith, describes the various states of the larynx, palate, tongue, &c., in singing, talking, yawning, and other acts. We shall revert to this journal in a future number.

The 'American Medical Monthly.' Dr. Austin Flint, on *Conservative Medicine*, advocates a closer observance of the natural powers, and the self-limiting action of disease. He objects to extreme courses of treatment. He remarks:

"Recurring to the definition of conservatism in medicine, it suffices to say that it means the preservation of the vital forces. It is a principle in medical practice, covering everything which prevents impairment of, or tends to develop and sustain, the powers of life. The terms 'vital forces' and 'powers of life,' although they are not readily explained, have a practical meaning, which is well enough understood, and it is unnecessary to enter into an explanation of them. It has been the object, in the foregoing pages, to give an exposition of conservative medicine, and to show that conservatism, in the sense in which the term is now used, is a distinguishing feature of medical practice at the present time, as contrasted with the practice which prevailed twenty-five years ago. The development and adoption of this principle have been seen to be results of the progress of medical knowledge, and the circumstances which seem especially to mark the beginning of the changes illustrating the principle are, abandonment of attempts to reduce the practice of medicine to a system, after the failure of the latest, viz.: Broussaisism, and the study of the natural history of diseases, as inaugurated by Louis."

The principles inculcated are precisely those which the English school has been the most prominent in advocating.

The 'The American Medical Times.' We extract from this journal the following article by Dr. Rufus King Browne, headed, "*Lessons in the Surgery of the War*:"

"About five hundred of those wounded at the battle of "Fair Oaks," who reached Fortress Monroe on transports, were examined by me, and I propose to mention some of the incidents during my attendance on them while at the Naval Hospital, which particularly engaged my attention. A large proportion of these, I think a majority, were wounds in the lower part of the body, showing that their enemies had practised the lesson "fire low." The wounds of a considerable proportion, which had lain some hours upon the field, had become a *nisus* for the larvæ of flies, and were occupied by myriads of these at various stages of development, and this was the same where the raw surface was of any greater extent than that pertaining to orifice of entrance or exit, whether it had been made by a missile or by the surgeon's knife in amputation. Nearly all the amputated cases were at the thigh, and were primary operations which had been very creditably done. Of the five—four of which were primary—which I particularly noted and cared for, three did well and are still doing so. One of the other two had secondary hæmorrhage, when the femoral was ligated on the eleventh day (so near as I could ascertain) after the amputation, and died the fourteenth day; the other, amputated by myself on the ninth day after the receipt of the wound (a compound and a comminuted fracture of the femur, extending to the knee-joint), died on the sixth subsequent day, without the supervention of secondary hæmorrhage. I had hoped better, though he was of poorly nourished body and comparatively infirm constitution. Of the three which are doing well, one had secondary hæmorrhage which required ligation of the femoral.

"There was one case of amputation of the leg, which "confirmed me" in my previous view, that where the comminution of the bones of the leg forbids the attempt to save, and requires amputation above the lower third, it had better, as a rule, be done at the knee-joint, and include a thin slice of the femur. In this case, the operation (primary) had been done just below the line of the upper and middle thirds. The thin layer of soft tissue corresponding to the anterior flap, had retracted so far as to bring its apex very nearly into a line with its original base, leaving the end of the protruding bone six or eight lines beyond it. In this case, when it became apparent that the bone must be shortened and covered by the formation of a new flap, I proposed re-amputation at the knee-joint, but by the advice of the surgeon in charge, I operated about two and a half inches above the first. The tissues were found to be morbidly vascular, and though the cut surfaces were not brought together until two hours after, when all oozing had ceased, on the fifth day ligation of the femoral was performed, and on the fourth subsequent day the patient died. All these cases were flap operations, as were those I did myself, and all but the latter were infected with maggots. I found no means of removing these except a move at a time by the forceps. Various solutions were tried for the purpose—dilute sol. nitric acid, &c., but were all wholly ineffectual. It occurred to me that quassia, the only bitter tonic which destroys the fly, might destroy the larvæ or disperse them when developed, but I could not obtain this article. Remarkably great in all these amputated cases was the amount of suppuration. In one the drainage of two days amounted to half a pint. This, of course, as compared with injury, which consisted merely of the canal formed by the track of the ball. In these latter it constantly seemed to me that there was a very decided difference in the amount of suppuration, whether the wound ran nearly transversely, or nearly longitudinally to the course of the muscles and aponeuroses—there being most in the latter case. But I noticed but little difference in this respect where the wounds respectively involved comminution of the bone.

"In none of these amputated cases had the flaps been kept in apposition by union, though in a large number of cases attended to, including the preceding five, some were progressed in granulation. [I was induced to think that the transportation to a distance from the place of wounding, of amputated cases, or capital cases of the extremities, particularly if such transportation consist in more than one change of conveyance, was not the best surgically. The contrary is undoubtedly the case with sick, or perhaps slightly wounded or injured men. But this opinion is not due to the increased danger during carriage of recurrent hæmorrhage, for this I think unsustained.]

"In the dressing of these cases I felt that some simple means should be devised for lifting upwards the under flap, which constantly tends to weigh away from the upper. All that is required in the case has hitherto been thought to be fully accomplished by the supporting roller about the base of the flaps. But this only keeps the cut surfaces closely pressed. But with this, if the under flap be heavy, it will weigh downwards and backwards, together with the upper which is kept fast to it, so far frequently as plainly to show beneath the latter the whole contour of the cut end of the femur. This lifting may be done by passing adhesive straps from a point behind the base of the flaps, and bringing them forward in one strand to hang upon some elevation at the foot of the bed. The stump up to the point at the base of the flaps where the bevelled form commences, rests upon its opposite cushion. These will, moreover, serve to gently raise the stump from the bed at the time of dressing, avoiding handling, one of the most important of all purposes to the surgeon, and by it also the cushion may be adjusted with the most comfortable nicety.

"I am inclined to think that it is preferable to make the posterior stump thinner—not shorter—than usual. The great mass usually left in the lower flap, when pressed up to admit the sutures, forms rounded prominences, not favourable to the object of bringing the surfaces in apposition.

"Whoever attended to these wounds with a reflective mind, could not fail to be struck with the consideration that the prevention or arrest of suppuration or a reduction to some attainable minimum, was the paramount consummation. It is not the *amount of pus discharged*, which is so contrary to all the physiological conditions of healthy tissue in the patient, for this only indicates the extent of the original morbid irritation which inaugurates the action of the tissues in the suppurative process. This suppuration consists in the enormously rapid multiplication of cells, which immediately and in virtue of the very same conditions which produce them, break down or as we term it "liquefy."

"To reduce or destroy this irritation—to the point where cell multiplication does not exceed normal "granulation"—is the desideratum. *Disinfectants* do not contribute to this end, though they do subserve equally important objects.

"The medication in all the preceding cases was done in accordance with my idea of supporting or protecting the *nervous system*—a different thing in my estimation from either supporting or stimulating, *i.e.*, *nourishing* the body. It consisted of quinine and morp. combined, with mild tonics. Where the pain of the cut or lacerated surface was excessive, the latter or pulvis opii was gently scattered upon it with immediate relief. Under the circumstances of such wounds, I am confident that the *assimilation* of however nutritious substances, is nearly or quite precluded by the physiological conditions, and hence nutritious diet is of little avail."

The 'Medical Times and Gazette.' Mr. Gulliver's Lectures are continued. He treats this week of the pale or colourless globules,

the lymph globules, and the molecules. We quote the following remarks on their *Development:*

"We have seen that, besides the globules of chyle or lymph, the granules, and the molecular base of the chyle, there are three sets of blood corpuscles. The first are the pale globules, which are analogous to the common or prevailing corpuscles of many invertebrata, and are present in the blood in smaller proportion than the red corpuscles, throughout the independent existence of vertebrata. The globules of the next set in the early embryo of mammalia soon become red by colouring of the envelopes; these corpuscles, disappearing at an early period of intra-uterine life, may be called the temporary or embryonic set; they have nuclei, are analogous to the common red corpuscles of oviparous vertebrates, and are soon succeeded by the common, permanent, or perfect set, which are devoid of a nucleus, and have no analogue unless it be in the nucleus of the pale globule.

"The red corpuscles of vertebrates are said to be developed from the young cells either of the germinal area or vitelline membrane, and the waste and supply of the perfect or common set from the globules of lymph and chyle. It should rather be said from the pale globules, which we have shown to differ remarkably from those of lymph and chyle. We need not dwell on the development, because we shall have to recur to the subject; and the different steps of it, as far as regards the oviparous vertebrata, have been admirably described in this theatre by my respected predecessor, Mr. Paget, though we must have recourse to the researches of Mr. Wharton Jones for the best description of the phenomena in mammalia. It may suffice now to note that in this highest class the nucleus of the pale globule is shed, and becomes the permanent red corpuscle; while, on the contrary, in oviparous vertebrates the nucleus ever remains within, and the envelope becomes red and flattened. That the red corpuscles of mammalia may be nuclei of cells was certainly shown by me in the 'Phil. Mag.,' 1842, and these objects have often been discovered since on the Continent, but without the least perception of their import.

"The pale globules and their nuclei, as well as the granules, may be formed in a mere blastema, and the phenomena are connected with what has been called 'nuclification,' into an explanation of which important subject we cannot enter at present. In the blood, there is probably a development of pale globules from those of lymph or chyle, and, indeed, the pale globules occur sparingly in the lymph. The origin, use, and destination of the granules is an interesting question, which cannot be disregarded, as will be shown on a future occasion, in any satisfactory account of the formation and supply of the pale and red cells of the blood. The particles of the molecular base of the chyle of mammalia appear to be the first fresh organic precipitate, during the height of digestion, in that fluid."

Dr. RAMSBOTHAM'S contributions headed *Clinical Midwifery* follow. All the cases reported are craniotomy operations. Dr. BUSHNAN'S *Hints for Certifying in Cases of Lunacy*, comprise brief descriptions of the states of mind which justify the giving of a certificate of insanity. Mr. FENTON MANIFOLD reports a *Case of Delirium Tremens* in which digitalis in large doses was given with advantage. We extract this notice of its action:

"Fourth day.—Much worse in every respect; wandering and delirious, although conscious when spoken to sharply. To have tinct. digitalis ℥iij. immediately, and the following mixture:—℞. Tinct. digitalis ℥j., tinct. lavand. co. ℥ss. mist. camphoræ ad ℥viij.; fiat haustus. Dose ℥i. omni secund. horâ.

"Fifth day.—Much better this morning, after a refreshing sleep. To continue the mixture.

"Seventh day.—Convalescent. From this date he improved gradually, although weak, and was discharged to duty on January 18, 1861."

A case of *Oblique Inguinal Hernia* is reported by Dr. MOORE, Brazil, in which the radical cure by Wutzer's operation, as performed by Mr. Bryant, of Guy's Hospital, failed, and Dr. Moore suggests the following method:

"Clear the patient's bowels; administer an opiate; place him in bed, head, shoulders, and knees somewhat raised. Chloroform. Having carefully reduced the hernia, and well smeared the inguinal integument over with simple cerate, make a linear eschar with a firing-iron, similar to that used by farriers, from about two inches above to one inch below Poupart's ligament, and at right angles with it, passing over the inner margin of the external ring. Any number of similar eschars the operator may deem necessary may be formed parallel to the first over the external ring, canal, and internal ring. The healing process will not be long delayed, and the result will be a like number of artificial, unyielding, intercolumnar bands, capable of offering a permanent barrier to the protrusion of a hernia. Care must, of course, be taken, in making the eschars not to burn too deeply in passing over the spermatic cord, and it might be well to run somewhat lightly over the rings and canal, dipping deeper towards the extremities of the eschars, so as to ensure attachment of the ensuing bands at these points to the deeper tissues. The requisite number of escharotic lines having been formed, it only remains to treat the case as an ordinary burn, keeping the patient in the recumbent posture, and, when practicable, supporting the part by means of a soft pad.

"This method, if efficiently carried out in practice, will, I think, be found quite calculated to fulfil all the indications for the radical cure of most varieties of hernia; and I am further of opinion that it is peculiarly adapted for the cure of hernia in its first stage of protrusion, and for strenghthening weak groins."

The 'Lancet.' Mr. HILTON on *Pain*, treats of hip-joint disease in further exemplification of his views. Dr. CHAMBERS contributes a lecture on the *Treatment of Acute Rheumatism.* He says:

"1. The patients are bedded in a peculiar fashion. All linen is strictly forbidden to touch the skin. A slight calico shirt or shift may be allowed; but if they possess under clothing only of the prohibited sort, they are better naked. Sheets are removed, and the body carefully wrapped in blankets, which are so arranged as to shut off all accidental draughts from the head. The newest and fluffiest blankets that can be got are used. The bedclothes being put so are kept so, and students are warned that, when they listen to the sounds of the heart, they must not throw open the blankets, but insert their stethoscope (first warmed) between the folds.

"2. Those joints or limbs which are swollen, red or painful, are wrapped up in flannels soaked with a hot fomentation consisting of decoction of poppy heads, with half an ounce of carbonate of soda to each pint.

"3. The following drugs are prescribed with a curative intention:—

"(*a*) If the skin is red, swollen, and painful about the joints—if the cellular tissue around the muscles is infiltrated and sensitive, so that motion is impossible or exuisitely painful—more especially if these phenomena are metastatic, leaving one part free and attacking another,—then they get the alkaline treatment pure and simple: they have a scruple of bicarbonate of potash in camphor water every other hour night and day when awake.

"(*b*) If the above-named phenomena are insignificant, and the pain is felt more in the bones—if it is intensified rather by pressure than by motion—if it is fixed in one spot and not metastatic,—then I add two grains of iodide of potassium to each dose; and directly the symptoms have taken a turn towards alleviation, I leave off the alkali altogether, and give only the iodide.

"4 Opium, as a palliative, is given in exact proportion to the degree of subjective sensation of pain. If one grain be not enough to entice sleep, a grain and a half is administered; if that do not avail, two grains. Directly the pain is better, the quantity of the drug is diminished. Nothing effects the desired object so well as pure opium.

"5. If the pain remains fixed in one joint, instead of leaving it like in other places, leeches are applied there, and the part is kept poulticed. When we can get them, young laurel leaves, bruised, are mixed with the poultice.

"6. The latter treatment is applied also to the cardiac region, if the heart has become inflamed either inside or out. The pain is taken as an indication of the extent to which the leeching is to be pushed, so soon as it is proved by auscultation that such pain arises from inflammation of the heart, and not from rheumatism of the pectoral muscles. The constant application of the poultice is made imperative.

"7. The diet is varied in some degree according to the antecedent circumstances of the patients. If they have been robust hearty persons before the attack they will bear a good deal of starvation, and they are put on our "simple diet"—to wit bread and butter, gruel, and tea, in quantities practically at discretion. If previously they have been ill nourished, by reason of either ill health or poverty a pint of broth or beef-tea is added.

Dr. Chambers then proceeds, at length, to give his reasons for this treatment. Some remarks on *Clinical Medicine* are contributed by Dr. PATRICK FRASER; Dr. WADE communicates some *Notes on Diphtheria*, and Mr. CHAS. GAINE the details of a *Plastic Operation on the Palate.*

IMPORTANT IMPROVEMENTS IN THE FACULTY OF MEDICINE OF PARIS.—The Minister of Public Instruction has just decided, upon the proposition of the Dean of the Faculty, that specialties shall be clinically taught in the hospitals of Paris by deputy professors of the Faculty who are at the same time physicians or surgeons of hospitals. Six such clinical courses are instituted: they are—1, skin diseases; 2, venereal diseases; 3, diseases of children; 4, mental affections; 5, diseases of the eye; and 6, urinary diseases. All these have been hitherto unofficially taught by very competent men. The Faculty was at last compelled to sanction specialties, and issue the above ordinance.

THE MEDICAL CIRCULAR.

WEDNESDAY, AUGUST 27, 1862.

THE NEW LICENSE OF THE COLLEGE OF PHYSICIANS.

The College of Physicians has created a new order of Licentiates, with a status, privileges, and restrictions hitherto unknown to the College. True, it has always had its Licentiates, who were in old times the pariahs of the College, who never exercised a right or enjoyed a privilege in connection with the institution to which nominally they belonged; but these gentlemen have been translated to a higher status—they are now *members* of the College, whilst the new Licentiates have taken their places as regards disqualifications, but are in all other respects of a different kin and order.

The College now seeks to identify itself with the great body of general practitioners and to become the vital governing head of the profession. It has made an election between exclusiveness and catholicity; and its choice is creditable to its judgment. As regards, then, the policy of the grand step the College has taken, we approve it frankly and cordially, inasmuch as it tends to break down the barriers that have been set up by rival corporations with a view of keeping apart the several sections of general practitioners, to introduce a nominal corporate unity, and to give effect to the essential cardinal truth that Medicine and Surgery are *one and indivisible*. For this alone the College deserves praise. It has lifted its landmarks and extended its borders to embrace the entire profession. Conscious of having, for two centuries, neglected its trust, and left some of its most important duties unfulfilled, it has now resolved to repair its errors, and to resume that lead, authority, and executive usefulness which it had voluntarily abandoned. The advancing liberality of the age has not passed over it without ruffling its stagnant surface; the urgent needs of a corporation in modern days have, moreover, taught it the lesson that liberality is the only wisdom that can enable it to meet the exigencies of its place and duty. Reputation, power, and profit equally concur to justify the course which the College has initiated.

We have used the term *initiated* advisedly; because we feel that the present "Regulations" do not represent either in principle or detail the requirements of the time, and that the College must advance further on the route it has commenced.

As an educational scheme, these "Regulations" fit in with those of the College of Surgeons as a casting fits into its mould, inasmuch as they give the same subordinate place to "Surgery" that the regulations of the College of Surgeons give to Medicine. The College of Surgeons requires from a candidate for the member's diploma a certificate of having attended *one* course of lectures on Medicine and the practice of Medicine; also Clinical Lectures on Medicine at a recognised hospital during *one winter* and *one summer* session. The regulations of the College of Physicians require from a candidate for the licence a certificate of having attended the surgical practice at a recognised hospital during *twelve months*, and the lectures on the principles and practice of Surgery *six months*, and Clinical Surgery *six months*.

This arrangement is obviously intentional. The College of Physicians requires as much too little of Surgery as the College of Surgeons requires too little of Physic; and the reason appears to be that it is hoped an amalgamation will eventually take place, and that the two Colleges will form a joint Board of Examiners. Should this union not be realised, the College of Physicians will be obliged to require a longer study of Surgery, in order that its licence shall be held in equal esteem with the diploma of the College of Surgeons, and give equal security to the public. Should these Colleges remain independent, and retain their present regulations, they would be bidding against each other for candidates by offering a low curriculum of study; one College tempting candidates who prefer Medicine with a small modicum of Surgery, and the other those who prefer Surgery with a minimum amount of Physic. But this is a state of things which the General Medical Council, if it be worth anything, could not permit. As separate Examining Boards for the same class of candidates, they must offer equal terms, neither taking advantage of the other, nor undervaluing the particular department of science over which its opponent is supposed especially to preside. It would ill become the College of Physicians to act upon such a false principle. It is probable, therefore, that ere long the College of Surgeons will accept the offer that was made to it more than twelve months ago to constitute a joint Board of Examiners with the College of Physicians, and in that way close the rivalry. We do not want two independent Examining Boards for general practitioners in this metropolis, with all their antagonisms, jealousies, and disputes.

Let us now inquire what will be the relation of the general practitioner—using the old comprehensive title—to these Colleges? As false, as unjust, as degrading as ever! Outcasts still; worse even in the College of Physicians than in the College of Surgeons. For the present we will drop the latter College from view, and limit our considerations to the former College alone.

In the College of Physicians, then, the Fellows are the ruling body; they alone can elect, legislate, and govern. The Members, who come next in order, are *alone* eligible to the Fellowship, so that in due season and by especial favour, one of them may be admitted to the inner sanctuary of dignity and power; as a member, however, he is not entitled to any share in the government, nor can he attend or vote at general meetings of the College. He enjoys the enviable privilege of listening to the Harveian oration, which is usually composed in a curiously abstruse and painfully unintelligible species of Anglo-Latin, and of using the Library and Museum. In this respect he is on the same level of corporate privilege with the Member of the College of Surgeons.

But what, you ask, are the privileges of the new licentiate? Verily they are numerous and important. He shall not be prohibited from practising medicine so long as he obeys the statutes of the College; he shall not be prevented from entering into partnership with another licentiate; he shall not be cut off the roll for dispensing medicines for his own patients; he shall not be interdicted from charging for them; he shall not be obliged to listen to the Harveian Oration; he shall not have the right of putting his foot inside the Museum; he shall not indulge his love of reading, nor promote the extension of Medical Science by having the use of the Library; he shall not be allowed to call the College *his* College, for he is expressly declared not to be a member of it; in fine, he shall have the high privilege of paying his money, taking his parchment, and going about his business.

The Licentiate will have no more corporate connection with the College than the Licentiate of the Hall has with the dreary fraternity in Blackfriars. It will be the fault of the Licentiates themselves if the liberal course now entered upon be not pursued to its legitimate conclusion, and the Profession made one in corporate right as in scientific acquirement.

THE PRACTICE OF PHARMACY.

We return to this subject because we feel that it is one of the greatest importance to the General Practitioners. Our two contemporaries are playing fast and loose with it, timidly mingling useful suggestions with insignificant qualifications, and putting a brave face on their own weakness and incompetence, by launching out in columns of abuse. The 'Lancet' arraigns the General Medical Council for not allowing reporters to be present at its meetings, and thus preventing this wise editor from knowing the arguments that were employed in defence of the Council's views in its controversy with the College of Surgeons. This is very trivial, and is important only in one sense—that of showing how incapable the Editor of that journal is of forming an independent opinion upon a great question of professional policy. The 'Medical Times' strives to conceal its original error by indulging in similar invective against the College of Surgeons.

Meanwhile the Council of this College has issued a Circular to ascertain the opinions of the teachers in the several Provincial Schools on this subject. Pending the answers of these gentlemen, we, once more, place our views before the Profession. Once for all, we do not desire to see the old system of apprenticeship established; that is to say, we object to a revival of the custom by which power was given to a master to command the services of a youth for five or seven years. Residence in a family, no doubt, had its advantages in moral discipline, in the control of eager passions, and in the inculcation of self-denial, obedience, and the courtesies of life. On the other hand, it cramped the intellect by confining the youth to the mechanical drudgery of the pestle and mortar, and extinguished that ambition of knowledge that can be kept alive and burning only by free and regular supplies of the oil on which it feeds. The habit of study must be commenced early, or it may never be acquired. Moreover, the appetite for knowledge should not be baulked during those years when the faculties are budding greenly and expanding to the world, when new susceptibilities to the influence of truth are quickening the mind with eager desire to search and learn and know all things within its reach and aim.

This may be conceded, and yet we may differ as to the practical conclusion? If the old custom of apprenticeships should not be revived, what should supply its place? Briefly we would say, let the Examining Boards require that a candidate for examination should produce a certificate from any registered practitioner that he, the candidate, has studied the Materia Medica and the practice of Pharmacy for at least one year (two, we think, would be better), under the superintendence of the practitioner giving the certificate.

It is absolutely necessary that a General Practitioner should have a thorough knowledge of drugs and the art of dispensing. We are inclined to believe that too much trust is placed in the preparations and compounds of the wholesale druggist, sanctioned though they may be by the Pharmacopœia. The knowledge of the value and efficacy of individual drugs is almost lost in consequence of their being generally ordered in combinations, the components of which are not always present to the memory of the prescriber. In the first year or two after the youth has passed his examination, he may possibly remember the composition of pil. scillæ co., or tinct. cinchon. co., or ext. coloc. co., and the relative proportions of the ingredients; but we very much doubt if a man who has been twenty years in practice remembers much of this lore. Yet it may happen that a particular compound fails of its object in a certain case, because of some ingredient in it which the prescriber did not know that it contained, and which has, therefore, set at nought his empirical experience. We apprehend that the low state into which therapeutics has admittedly fallen is due, in a great degree, to this use of complex compounds, and the inattention to the operation of individual remedies which necessarily has arisen from this practice.

However this may be, it is time that the department of therapeutics and, auxiliary thereto, the art of dispensing, should be cultivated with greater care. Not, indeed, that we wish to see prescriptions become more elaborate, but, on the contrary, less official and authoritative, in order that a closer familiarity with drugs may lead to a more exact knowledge of their distinctive qualities and uses, so that Medical practice may be simplified and rendered more effective.

We care little about the quarrel between the General Medical Council and the College of Surgeons; we ask for some regulation in this matter of Pharmacy, and shall thank either body that assists us to obtain it.

ALIVE O!

The Editor of the 'British Medical Journal' found prudence enough to keep silence during the few weeks preceding the Annual Meeting, but now that it is over, and its members have dispersed, he has op'd his mouth, and brays in most discordant tones. He has the whole field to himself, and, rejoicing in his freedom, he cuts shines with his heels, stretches out his neck and inflates his nostrils till they ring forth long and sonorous vibrations. We suppose that we may venture to look over the hedge whilst he is disporting himself thus joyously.

Our animated contemporary is especially indignant with the Editor of the 'Lancet,' whom he compliments with the soubriquet "Tartuffe." Calling names is the safest and strongest of all arguments, for it is one that can never be refuted; it is so elegant and gentlemanlike withal! We leave "Tartuffe," however, to his own defence, and we make no doubt that he can find language plain and direct enough for the purpose.

Then this worthy complains that the MEDICAL CIRCULAR "wants to lay hold upon the subscribers of the 'British Medical Journal.'" Of course we do, and mean to have them, too. Sleep upon that assurance if you can, astonished Editor! How do you suppose the MEDICAL CIRCULAR is supported, if not by its list of subscribers? Is there any fault in desiring to increase that list, and thereby enlarging the utility of this Journal? Is there any fault either in being honest enough to confess that which is a transparent truth; and which no one but the Editor of the 'British Medical Journal' would be dunce enough to attempt to mystify?

Understand that we do not pervert large funds from their proper uses into our own pockets. We do not profess to provide one thing and substitute another. We do not pretend to keep up a Medical Association, that we may gorge all the profits of an ignominious journal. Such hypocrisy is not ours. We place the MEDICAL CIRCULAR in the market in open competition with its older rivals, and we ask for subscribers on its merits and get them! We do not say, "Come, let us subscribe to a great Association that we may enlarge the boundaries of Science, reorganise our noble Profession, and protect its interests by legislative enactments," and upon this pretence collect funds which are destined to be exhausted upon the editors, contributors, printer, and publisher, of a dismal

journal. The genius of humbug and prevarication is not yet installed in the Office of the MEDICAL CIRCULAR.

Pray, Mr. Editor, inform us how it happens that with your two thousand subscribers, many of whom are men of science and habitual writers, you are obliged to expend three hundred pounds *per annum* for contributions? Is [illegible] practice. department of dispensing that [illegible] consequently left so destitute of [illegible] known to the [illegible] obliged to pay for hired services? Is it [illegible] that the members will not support the Journal with their scientific contributions, but content themselves with doling out a livelihood to the literary staff from their purse? You do not represent the science of your members, but the pockets of your subscribers. That is the difference. We have no doubt that the arrangement is very satisfactory to you, and that you will do your best to make it perpetual.

SUMMARY OF THE WEEK.

ST. GEORGE'S HOSPITAL.

The finances of this Institution are in so mysterious a condition that the Governors do not appear to be able to comprehend them. In their advertisements they state that their present income is unequal to their expenditure, and appeal piteously for aid. They have also, in the extremity of their despondency, made allusions to the "Morley Fund," which have drawn forth from Mr. W. J. Goodwin, a surgeon residing at Hampton Court, and one of the executors of the late Mr. Morley's will, a rebuke that must make them feel exceedingly unpleasant. Mr. Goodwin is evidently very indignant, for he has gone to the expense—always a fair test of a man's feelings—of publishing in the newspapers a long counter-advertisement, from which we make the following quotation:—

"The weekly board, in the same report, in their zeal for funds, have thought fit to make the following ungracious remarks relative to the legacy of the late Mr. A. Morley:—'The Weekly Board consider it right to revert to the fact of the large legacy left by the will of the late Atkinson Morley, Esq. This will not become payable until July, 1863, and then will not be applicable to the general purposes of the Hospital, for, by the strict terms of the will, the whole must be devoted to the building and endowment of a Convalescent Institution, situated at some distance from London, which, although under the direction of the Governors of St. George's Hospital, will not add one penny to its funds.'

"As an executor to Mr. Morley's will, I am in a position to state the sum the Hospital will receive already amounts to considerably more than 150,000*l*. My co-executor and myself thought it necessary, in consequence of unexpected large claims for legal and Medical services by our co-trustees, to place the administration of the will in the Court of Chancery, and the Board have no authority whatever from the Court for stating that the intentions of Mr. Morley will not be carried out—viz., 50,000*l*. for the Convalescent Institution, and the remainder for the general purposes of the Hospital."

Mr. Goodwin roundly accuses the Governors of misrepresentation, or mis-statement, or whatever other euphemistic name may be applied to their language. There can be no doubt that the Governors have conducted their affairs with reckless extravagance, and have very nearly ruined the Hospital. As an example of the mode in which the funds have been misapplied, Mr. Goodwin says:—

"Notwithstanding the Weekly Board's representation of want of funds, they are paying 200*l*. annually for the rent of premises, belonging to Sir Benjamin Brodie, in Kinnerton street, as a Medical school; although the opinion of their counsel, obtained by Mr. Morley, when it was first proposed in 1849, was that this sum could not legally be taken for such a purpose from the funds of the charity."

There is not now, and never was, any real necessity for this Kinnerton-street School, the old one adjoining the charity being adequate for all the wants of the students attending the Hospital. But jealousies arose—quarrels grew out of them—Sir Benjamin must have his School, and established one, a long way off from the Hospital, in Kinnerton street. Until this week we did not know that the premises were Sir Benjamin's private property, and that the charity funds were muleted, to the amount of two hundred pounds *per annum*, to pay the rent! We live and learn.

COMMITTEE ON THERAPEUTICS.

The British Medical Association has done what we have long declared there is a paramount necessity of being done by some society—viz., appointed a Committee to investigate the action of therapeutical remedies. Dr. Handfield Jones, Dr. Bennett, and Dr. Acland, with their associates, are competent men to undertake this task, and we hope their inquiries will be searching and satisfactory. Perhaps it would be better at first that they should limit their attention to three or four important remedies or forms of disease, and, having exhausted these, afterwards extend their investigations in other directions. We hope the Profession generally will assist the Committee with their experience. The farther this movement advances, the more marked will be the proof of the propriety of the criticisms in which we indulged some time since in connection with the brandy-practice of the late Dr. Todd. In fact, the MEDICAL CIRCULAR originated this movement. Nothing but those sharp strictures, which brought down upon us at the time the jealous and impotent wrath of our contemporaries, could have sufficed to raise the Profession to a sense of the necessity of completely revising the present therapeutical system. As we said then, we still say—we must learn the ways of Nature in the cure of disease with more clearness than we understand them now, before we can rightly estimate the value of remedies.

OVARIOTOMY.

The statistics of this operation are not quite so satisfactory as we should like. Mr. Spencer Wells, who has evidently not gone very far into 'Cocker,' congratulated himself the other day that he cured two out of three persons operated on; but since that time he has been corrected, and it appears that he has cured only three out of five. He has been more successful with his later cases; and, it is to be hoped, the tide will not turn. Unfortunately, the recent operations in France have not been very promising. M. Nélaton's first case has proved unsuccessful. The patient recovered from the immediate effects of the operation, but died twenty-nine days after from tetanus. Another death has happened from a like operation, but others are still in progress, the results of which we shall soon know. In consequence of the difficulty of diagnosing suitable cases, the first operations are likely to fail.

CHLOROFORM INHALERS.

Of six various kinds of new chloroform inhalers in the Exhibition submitted to the Jury of Class XVII., one only obtained a prize or honourable mention; it was shown by Dr. Kidd at the close of the late "Association" meeting at the College of Physicians. It is said that where the chloroform is quite pure, and administered with discrimination by means of this instrument, the chance of a fatal accident is reduced to a *minimum*. It has been now tested widely in France; a Turkish and Madrid and Polish surgeon, also recently in London, have obtained inhalers of the same kind, with a large supply of the most improved needles, knives, ovariotomy clamps, &c.

LONDON VISITORS.

The recent festivities at the Colleges have been the cause of a great influx of visitors to London. In addition to the presence of Baron Wensleydale, Professor Carpenter, Professor Sharpey, and many other notables at the evening conversaziones, we found amongst the names of foreigners lately in London invited to the "Association," Dr. Florinski, of St. Petersburgh; Dr. Goldstein, of Moscow; Dr. De Castro, of Constantinople, in attendance on the Viceroy of Egypt; Dr. Faucher de Foca, of Madrid; Sig. Ganzarella, of Italy; Drs. Kennedy, Butcher, Fleming, Tuffnell, and Maclintock, of Dublin; Sir Joseph Olliffe, of Paris, as well as MM. Jules Joux, Debout, Demarquay, Nélaton, and Giraldes, of that city, as also Professor Ciacci, of Naples; Dr. Burnett, of Brazil; Fagielle, of Poland, and numerous others. It has been quite a reunion of Medical authorities from all parts of Europe; the majority of these gentlemen, we are told, were assembled at the Suburban Hospital of Mr. Baker Brown, during the month, and on one day, three vesico-vaginal fistula operations were performed successfully in about fifty minutes; they were also astonished by the *habilete* of our other great operator, Mr. Fergusson, at King's College.

MR. CHARLES HAWKINS ON THE CONSTRUCTION OF HOSPITALS.

This gentleman has been favouring the Profession with his views on the construction of hospitals, and has received the flattering eulogies of our contemporaries. We were amused at observing how small an amount of desert could receive so large a share of panegyric, and turned from the subject as one not at all according to our taste or judgment. In fact, we did not notice it; for we could see nothing new or meritorious in Mr. Hawkins's suggestions. We now extract an article from the pages of the 'American Medical Times,' which will, prove that we are not singular in our opinion, and will at the same time, provide us with some new ideas on ventilation, or, rather, perhaps, we should say, old ideas with a new application:

"It is not surprising that illiterate persons should regard 'scientific ventilation' as of no account. They are too often unable to appreciate the value of good ventilation, either from habits of living, or from an obtuse sensibility of their organs of special sense. But it is surprising that a man of refinement, and having a Medical education, and above all, devoting his attention especially to hospital construction, should venture the assertion that he has 'very little faith in what is called scientific ventilation.' But such is the assertion of Mr. Charles Hawkins, of London, who is spoken of as the best qualified person in that city to advise in the construction ot hospitals. His plan of ventilation is by windows. He thinks the ventilation of a hospital is a very simple matter. If Mr. Hawkins is a fair exponent of the state of hospital architecture in London, there can be no doubt that it is still sadly deficient. Scientific ventilation is not a failure in this country, but has been carried to such perfection that the building of public edifices with only windows for ventilation, is now simply criminal. Windows arranged according to Mr. Hawkins's plan, will answer very well in summer, but they are almost valueless in winter. The method of Dr. Griscom, of this city, by means of tubular shafts, increasing gradually in diameter from basement to garret, on the principle of the circulation of venous blood through vessels of increasing calibre, will, we believe, prove of incalculable advantage. It has already demonstrated the fact, that 'scientific ventilation' is not a failure."

SPECIALTIES IN PARIS.

As an evidence of the progress in the cultivation of special branches of Medical practice, we may cite the fact of the formal recognition of specialties by the Faculty of Medicine of Paris. The Government, upon the recommendation of the Dean of the Faculty, has determined upon appointing lecturers in the various branches of special practice, now privately taught in Paris. Thus specialties are formally recognised as an integral part of professional education. The Profession in our own country, led blindly on by the teachers of our great Hospitals, who have a strong personal interest in eschewing specialties, have denounced them as an unmitigated evil. Yet there is no fact more clear than this, that all our great advances in ophthalmic, syphilitic, aural, psychological, and obstetrical physic, have been made by specialists.

REVIEW OF BOOKS.

The Cyclopedia of Practical Medicine and Surgery, including an Etymological and Critical Terminology; Descriptions of Instruments and Apparatus, a copious Bibliography, and an Historical view of the progress of the Science to the present day; the whole presenting a complete digest, alphabetically arranged, of the Doctrines and Practice of Surgery. By William B. Costello, Assisted by numerous distinguished writers in the various departments of Medical and Surgical Science. Illustrated with numerous engravings and woodcuts. London: Taylor and Greening.

This great work, which has occupied Dr. Costello about ten years in completion, is at last presented to the Medical public in a complete form, having been finished within the last few months. The work consists of thirty parts, occupying 3,000 pages in double columns, and is printed in clear type, on a first quality paper, and strongly bound in cloth lettered; in fact the getting up of the book is unexceptional. As for the contents we can only give a faint idea of its merits in a short notice of this kind; it embraces every known branch of the science of surgery, and contains about 1,500 illustrations executed on wood and steel in a very superior style.

In noticing the names of contributors and their contributions, it is quite impossible to do full justice to all, the range being so extensive—it will therefore be sufficient to say that the chapters on the various subjects have been written with the greatest care and research, the names of the contributors being sufficient guarantee as to their value.

The first volume contains an elaborate article by the late Bransby Cooper, on Abdomen and Ablation; Abscess, by Dr. Costello; Amputation, Drs. Ring and Costello; Anastomasis, by Dr. Wardrop; Morbid Anatomy, Dr. Hodgkin; Surgical Anatomy, Dr. Tarral; Aneurism, Drs. Wardrop and Costello; Anchylosis, Dr. Velpeau; Surgical Anatomy of the Ankle, by Dr. Tarral; Anchylohlepharon and Anchyloglossum, by Dr. Dieffenbach; Anchylosis, J. Blackburn, Esq.; Bandage, H. J. Chapman; Bronchotomy, T. Spencer Wells. Dr. Costello has written the articles on Catheter and Catheterism, a subject which he is eminently capable of handling. Dr. Alexander Ure contributes the articles on Cicatrix and Cicatrisation; Clubfoot, is by H. J. Chapman.

In the Second volume Dr. Costello is author of the articles on Joints; also of those on Lithotomy and Lithotrity, to the latter of which we would direct special attention, Dr. Costello having paid great attention and attained to great eminence in that specialty. Dr. Paul Broca contributes the article on Necrosis. Dr. Costello has furnished many most elaborate articles in the third and fourth volumes, among which we would particularly direct attention to those on Œsophagus, Orthopædy, Paracentesis, Phlebitis, *Prothesis*, Ranula, Tetanus, *Writer's Cramp*, Vagina, &c. We cannot omit to remember also the excellent article of Paul Broca, on Tumours, in which he embodies everything that can in any way contribute to the elucidation of this interesting subject.

It is scarcely possible to have a just idea of the value of this great work without looking over its pages, in which will be found many and valuable contributions which cannot possibly be noticed in a Review; but the contents of the Four Volumes present a connected series of articles arranged in alphabetical order, to which the student or practitioner can refer, with the certainty of finding much valuable information in every branch of Surgery.

Dr. Costello has by his labour and research rendered a great service to the science of Surgery, and his name will always stand in the first rank amongst his fellow labourers in the cause. His great work the 'Cyclopædia of Practical Surgery,' will stand as a lasting memorial of his industry and perseverance.

In conclusion, we most heartily congratulate him on the result of his labours, and strongly recommend the 'Cyclopædia' to the notice of every member of the Profession, and we may truly say that no Medical Library can be considered complete without it.

On the Diseases and Injuries of the Hyoid or Tongue Bone. By Geo. D. Gibb, M.D., M.A., F.G.S. Illustrated with engravings on wood. London: John Churchill.

In the little work before us the Author has, by much labour and research collected together a number of cases, illustrating the dis-

cases and injuries to which the tongue bone is subject, and which have hitherto been almost entirely overlooked in Medical and Surgical works. He has demonstrated the necessity of being acquainted with those affections which explain many anomalous symptoms referred to the throat by the patient and have been attributed to the larynx, but which *post-mortem* inspection has proved to be caused by some abnormal condition of the hyoid bone.

The diseases treated of are, 1st, Inflammation and its consequences, such as Necrosis, and Expulsion. 2. Sub-hyoid abscess. 3. Thyro-hyoid cysts. 5. Osseous tumours. 6. Tumours springing from the hyoid periosteum. 7. Eburnation of the hyoid bone. 8. Diseases of the thyro-hyoid articulation, relaxation of the ligaments producing dislocation, hydrarthrosis, anchylosis, spontaneous rupture of the ligaments. 9. General displacement of the entire bone. 10. Diseases of the bone or its periosteum by extension from the tongue and neighbouring parts. 11. Hyoid neuralgia. The injuries are, Fracture of the bone from manual violence, fracture from accidental causes, fracture from hanging. 12. Laceration of the soft parts attached to the hyoid bone. 13. Wounds of the hyoid bone.

This is a pretty long list of diseases and injuries to be referred to so small a portion of the human skeleton; but Dr. Gibb has proved that they may all occur under certain circumstances, and that it is very necessary that the Medical Practitioner should be acquainted with them, in order to remedy the inconvenience and danger arising from them, and to prevent his doing harm by treating the symptoms as belonging to some other affection.

The cases given are very curious and interesting, and show that the author has bestowed great pains on the subject.

We recommend a perusal of the book by those who wish to gain useful information, and can assure them that they will not regret the time thus spent.

GENERAL CORRESPONDENCE.

MYSTERIOUS POISONING CASE IN ISLINGTON.

To the Editor of the Medical Circular.

Sir,—On Tuesday, August 19th, Mr. Humphreys resumed an inquiry into the death of Sarah Ryan, aged twenty-four, who was found one Sunday afternoon, about five weeks back, in articulo mortis, in the back kitchen of a house in which a friend was in service, this friend having gone to church, and there being no other person in the house, save and except Mr. James B. Greening, a gentleman lodger.

The evidence was very conflicting in the following particulars:—

Her servant-girl friend, on being told of her illness, said she was *liable to fits*. This the mother *denied*. It was clearly proved that a medical man attended within *a few minutes* of death; yet this gentleman affirmed she had been dead *from one hour and a half to two hours*. He gave no evidence of perceiving the fumes of prussic acid; yet a *trace* of this, discovered in the stomach, was pronounced the cause of death, whilst the head symptoms would have denoted either *natural disease* or more than a trace of the poison.

Near the deceased was found a cup which had contained a solution of cyanide of potassium, and a glass containing a brown powder in some water (ergot of rye?), which unfortunately was thrown away.

"The womb presented a peculiar appearance," said Professor Harley. "I detected a *conception* of between second and third week."

Evidence was tendered of the unfortunate deceased having previously been in trouble, from which, it was asserted, *she took means to free herself.*

Does not this fact sufficiently account for her decease, in the utter absence of any motive for taking her life by her own hand, or by that of another? The public are becoming more informed of the properties of cyanide of potassium than formerly. Hydrocyanic acid, Pereira speaks of as having been used as an abortive agency. Dr. Brown strongly favoured this supposition in his evidence before the jury, and fully explained to them how the cyanide of potassium would become converted into hydrocyanic acid by means of the hydrochloric acid evolved during digestion.

The medico-legal points are very fine in this case but I apprehend a medical jury would come to this decision—*i.e., death in attempting abortion.*

OBSERVER.

THE LAUNCESTON MURDER.—The main part of the circumstantial evidence on which the man John Doidge was found guilty of murder was the detection, by the microscope, of blood-stains on his clothes, and of some minute coagula of blood on a billhook in his possession. Professor Taylor rightly allowed that no one could positively distinguish human from animal blood, but added that in this case the blood had all the appearance of human blood. He said that he did not rely upon the chemical examination, but on the microscopic, and in the course of twenty years' practice had never been more satisfied than on the present occasion.

MEDICAL SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JULY 2nd, 1862.

DR. TYLER SMITH, PRESIDENT, IN THE CHAIR.

DR. ALFRED H. M. M'CLINTOCK, late Master of the Dublin Lying-in Hospital, read a paper

ON TURNING IN CASES OF DISPROPORTION.

This paper embodied the results of seventeen cases which came under the care of Dr. M'Clintock in the wards of the Dublin Lying-in Hospital. In each of them turning had been performed, at various periods after the commencement of labour, on account of disproportion between the head and pelvis. In none of these cases was there any considerable deformity of the pelvis, though the obstetric histories of the women clearly showed that there must have been some slight narrowing of the superior strait. More or less difficulty was experienced in every instance in bringing down the head into the pelvis, and twice craniotomy had to be resorted to. On one occasion the parietal bone (that next the sacrum) was fractured in pulling the head through the brim of the pelvis. With one exception, all the patients were deeply chloroformed before the operation of version was undertaken. Nine of the children—viz., four boys and five girls—survived birth, though all were alive when the operation was commenced. Of the eight children dead born, five were boys and three girls. The heart continued to pulsate for several minutes after birth in some of the children recorded as "dead born," Dr. M'Clintock not considering a child as saved by an obstetric operation, nor recording it amongst the "live births," unless respiration be fully established. All the women recovered satisfactorily but one, who died of puerperal fever, of which some cases had occurred at the time in the hospital.

In reviewing these cases, Dr. M'Clintock expressed his opinion that the operation was not so favourable for the child as some of its advocates had supposed, and that it was only when the amount of pelvic narrowing was very slight that we could reckon with any degree of certainty upon saving the fœtus. He would, not, therefore, recommend the operation in preference to the induction of premature labour in cases where an option was left us, and a decided contraction of the pelvis was known to exist. At the same time that it was a valuable resource in cases of this class which may have reached the full period of pregnancy, he proved by the fact, that of eighteen boys born to the above patients, and delivered by other modes than turning, only two were alive at birth; whereas four out of the nine delivered by turning survived their births.

Looking to the interests of the mother, the author of the paper considered that the operation of turning in the particular class of cases under notice had stronger claims; for not only did it abridge the labour process, which in itself was no small advantage, but it averted the possible contingencies of craniotomy, high forceps operation, or even of rupture of the uterus. Its great mechanical advantage, Dr. M'Clintock thought, was due, not to the position of the head, nor its greater compressibility when coming through the pelvis with the base foremost, but to the unlimited amount of force which we can bring to the aid of the uterus by traction on the body of the child.

Dr. BARNES expressed his thanks to Dr. M'Clintock for having brought this important practical question before the Society, the more especially as his paper was based on so broad a foundation of facts. Dr. Barnes hoped that as one who had some personal experience of the operation, he might without impropriety respond to the invitation of the President. He observed that the revival of the application of turning to certain cases of disproportion constituted one of the greatest merits rendered by Professor Simpson to obstetric practice. He felt he was justified in calling it a revival, for he thought there was abundant evidence that the great accoucheurs who practised one and two hundred years ago were accustomed to trust to this operation much more freely than was now done. To this course Dr. Barnes said they were almost compelled by the want of those instruments with which in our day we were enabled to encounter cases of disproportion. Having no forceps, and but inefficient instruments of any kind, they were forced to trust to their unarmed hands. With their hands they extricated themselves and their patients from many difficulties, in which we resorted to the perforator or other instrumental aid. He entertained a strong conviction that we should return to a more sedulous cultivation of the hands as an obstetric instrument, and that material improvement in obstetric practice would result. The extension of the operation of turning as a substitute for more hazardous operations, and as a means of extricating patients from a variety of dangers, was especially to be desired. The particular application of turning to cases of disproportion was one of which he had formed a favourable opinion. At first, after Dr. Simpson's proposition to revive it, he distrusted its utility. He tried it by the favourite test of statis-

tics. But he had since learned that we possessed no such statistics as would serve for the determination of any great question in obstetric practice. He had put the question fairly to the test of experience. He might state the general result of his observations as follows:—Disproportions might be divided into three degrees: First, there were slight disproportions giving rise to protracted labour, which admitted of being relieved by the long forceps; but the forceps must be not only long, but double-curved, well-made, and capable of being worked by the two hands. There was then a second degree, or class of cases, lying between the class capable of relief by the forceps, and the third degree, or class, in which craniotomy was necessary. This second or intermediate degree it was that properly admitted of treatment by turning. Beyond the third degree might be added a fourth, in which the Cæsarean section was the resource. It was thus seen that the operation of turning stood between the patient and craniotomy, promising to avert the necessity, in some cases, of resorting to that repulsive operation. It did not appear that the disproportion in most of Dr. M'Clintock's cases was great. It seemed probable that in some of them the long forceps might have been successful. Where there was only slight pelvic contraction, he (Dr. Barnes) thought it right to try the forceps first, and failing in this manner, to proceed to turning. It was true that the practice was necessarily experimental. Dr. M'Clintock had fairly said that we could not determine beforehand the size of the child's head. We could not, therefore, tell beforehand what the degree of obstruction would be. But if the child were born dead after turning, we had at least the satisfaction of reflecting that the child was not sacrificed of necessity by the mode of operating, as was the case in perforation. If it perished, it was because it had to pass through a pelvis whose condition was incompatible with the birth of a living child. He did not assent to the opinion of Dr. M'Clintock, that the head did not come through the pelvic brim more easily when drawn through base first, than in the ordinary mode of entry by the crown. He thought the passage much facilitated. It might seem strange, but he had seen reason to believe that, in these cases of disproportion, the child had a somewhat better chance of being born alive than after turning under ordinary conditions. The common cause of disproportion was slight projection of the promontory of the sacrum; on either side a marked hollow was preserved, in one or other of which the cord would lie protected. A very valuable application of the practice was found in the completion of delivery after perforation. In cases where much difficulty had been experienced in extracting the head by the crotchet and craniotomy-forceps he had, on several occasions, delivered with ease in a few minutes by turning. Much labour to the practitioner, exhaustion and distress to the patient, were thus saved. He would make one more remark; it was that, although great force had occasionally been necessary in extracting, he had never seen the smallest injury result to the mother. The patients had recovered as speedily and as well as after ordinary labours. Dr. Barnes concluded by again expressing his sense of the high value of Dr. M'Clintock's communication.

Dr. KIDD thought that no comparison could be drawn between the statistics of former times and the present, because the influence of chloroform must be taken into account.

Dr. BRAXTON HICKS considered that the cases brought forward by Dr. M'Clintock could scarcely be fairly quoted as examples of the value of turning over the use of the long forceps in either delivering the child or in saving its life. Those cases only could be admitted as absolute proof on that point in which the forceps had been applied, and had failed to bring the head through, but where turning had been subsequently resorted to with success. Dr. Hicks instanced a case which occurred to him recently, in which the long forceps failed to bring the head through the brim, but where, by version, the child was delivered after some detention, its heart pulsating for an hour and a half after, inflation of the lungs being continued till it ceased. In this case the forceps failed. Turning gave the child a chance to say the least, of life, which the only other treatment left namely, perforation—could not.

Dr. GRAILY HEWITT had an observation to make with reference to the difficulty the author of the paper had alluded to of effecting the transit of the body of the fœtus, after turning, where only one foot had been brought down. He believed that the difficulty in question was not confined to cases in which the head had originally presented as the author seemed to infer was supposed to be the case; and that on the contrary, the same difficulty was found in other cases—in transverse presentations, e. g. He had met with a case which bore out this view of the matter. It had been a sort of maxim that the bringing of one foot down was sufficient. He thought that the erroneousness of this teaching should be pointed out, and the necessity of bringing down both feet, in cases of turning, inculcated. In common with other speakers, he begged to express his thanks to the author for the very valuable contribution he had made to obstetric science in the paper now read to the Society.

Dr. M'CLINTOCK replied at some length to the observations of the various speakers, and the meeting then adjourned.

STRICTURE OF THE RECTUM.

Dr. Buck related a case of stricture of the rectum. The patient was a woman, æt. twenty-four, of healthy appearance. On examination per rectum, he discovered about two inches above the anus an annular stricture, not scirrhous in character. Per vaginam he found a firm fibrous tumour, of even contour, in the posterior cul-de-sac: he could sweep with the finger almost the entire circumference of this tumour, and it was slightly movable. The woman suffered occasional bearing-down pains, and the stools were hard and difficult. On distending the anus with a speculum, the stricture was readily observed. This was divided anteriorly, and posteriorly, and by tearing the tissues the finger was carried well above the stricture, so as to reveal the fact that the supposed fibrous was in reality a fæcal tumour. The woman had never had dysentery.—'American Medical Times.'

LEGAL INTELLIGENCE.

A "SUB M.R.C.S." AT ORMSKIRK.—We abridge the following from the 'Ormskirk Advertiser' and the 'Southport Independent:'—

"At the Ormskirk Police court, on Friday, the 8th inst., before H. Gaskell, Esq., J. H. Wrigley Esq., and Captain Webb, Mr. Josiah Archer Bowen, of Bretherton, was summond by Mr. Charles Price Symonds, Surgeon, at the instigation of the Medical gentlemen of Ormskirk and its vicinity, for the following offence: 'That he did, unlawfully, wilfully, and falsely, pretend to be and take the name and use the title of a Surgeon, by giving a certificate of the death of Mary, daughter of William Whittle, and writing thereon, under his name, the letters "Sub. M.R.C.S. Eng.," implying that he was recognised by law as a Surgeon.'

"Mr. Torr (barrister, Manchester), instructed by Mr. Parr, Ormskirk, prosecuted; and Mr. Husband, solicitor, Liverpool, defended.

"Mr. Torr, in opening the case, said the Act of Parliament under which the summons was taken out against the defendant was the 21st and 22nd Vic. cap. 90, which enacted that,—'Any person who shall willfully or falsley pretend to be, or take, or use the name or title of a Physician or Doctor of Medicine, Licentiate in Medicine and Surgery, Bachelor of Medicine, Surgeon, General Practitioner, or Apothecary, or any name, title, addition, or description, implying that he is registered under this act, or that he is recognised by law as Physician, or Surgeon, or Licentiate in Medicine and Surgery, or Practitioner in Medicine, or an Apothecary, shall upon a summary conviction of such offence, pay a sum not exceeding 20*l*.

"The defendant was the son of a gentleman, who was a Dissenting minister, and devoted the latter portion of his life to the study of Medicine, but he confined himself to the milder and simpler medicines made from the beautiful flowers of the field, which would not kill any one were he to swallow a basketfull of them. By that little bit of pedigree they might perhaps judge of what sort of a breeding the defendant had had. The father taught the son the skill of Medicine, such as he himself had acquired. The defendant commenced business under his father's roof, with the herbs of the field for his medicines, and at length he cherished a desire to become a member of the recognised Profession of Physic. He attended certain classes in Liverpool, in all probability with great benefit to himself; and went to London in May last, but whether he studied there at all, or for any length of time, he could not say. He did submit himself to an examination, and having done so he must have presented certain credentials that he had gone through a certain course of study; and he (Mr. Torr) had been told, whether from nervousness or inability, he could not say which, that he had the misfortune to fail in showing that he was qualified to act as a Surgeon. He would be able to show that in March preceding that date he had the effrontery to put himself forth as a Member of the Royal College of Surgeons. In March last a man named John Whittle had a grand-daughter who was very ill, and he called in to her assistance the defendant. He attended upon her for some time, the last time being a week before her death. When she died it became necessary that the certificate of a Medical attendant should be presented to the registrar of the district. A young man was sent to the defendant for the certificate. The certificate was written and signed by the defendant. Thus the defendant had misled a parochial officer, and got him to receive from an unauthorised person a certificate of the death of the deceased. He had not only got the registrar to receive the certificate, but had signed it.

"'I hereby certify that Mary, daughter of William Whittle, of Burscough, aged 20 years, died yesterday, the 26th inst., from albuminuria, and that she has been duly attended to. As witness my hand this 27th day March, 1862.

'J. ARCHER BOWEN, Sub. M.R.C.S. Eng.'

"Now, he (Mr. Torr) was at a loss to know what on earth was meant by the word 'sub.' If the defendant meant that he was a member of the Royal College of Surgeons of England, he (Mr. Torr) was at a loss to know why he should prefix the title with the word 'sub.'

"John Whittle then proved the attendance of the defendant on his grand-daughter, his payment by 'ready money,' the child's death, and the writing the above certificate by defendant. Mr. Sumner, the registrar, proved the receipt of the certificate. Similar attendance and certificate after death were proved in the case of a boy named Hunter. The registrar wrote the word 'certified' after the entries in these cases. He said, 'I am instructed to write "certified" when the death is certified by a Medical man or qualified Practioner.'

"Mr. Torr: Do you, as a matter practice, write the word 'certified' if the death is not certified by a Medical man?

"Sumner: No; I registrar the death according to the statement of the informer, and write the words 'not certified.' I wrote 'certified' because the certificate sent, as I conceived, was by a qualified Medical Practitioner.

"The clergyman who performed the funeral gave similar testimony. There was much discussion as to the possible meaning of the epithet 'sub' which was put before M.R.C.S. For the defence it was urged that these words were 'rubbish,' and were not intended to imply that the defendant was a registered Practitioner; and witnesses were called who had known him all their lives, and swore that they thought the words 'Sub M.R.C.S.' intended to convey the idea that he was a Medical student. The bench, after consideration, convicted the defendant in the full penalty in one case, 20*l.* with costs, which amounted to 25*l.* 1s. 10d besides.

"On Monday last Mr. Bowen appeared before the bench of magistrates at Southport, and entered into recognisances, together with two sureties to prosecute an appeal against the above decision in the Court of Queen's Bench."

Births, Marriages, and Deaths.

BIRTHS.

BARNARD.—On the 15th inst., at Montague house, Hastings, the wife of T. W. Barnard, M.D. Edin., of a daughter.

BLAGDEN.—On the 11th inst., at Castle villas, Stroud, Gloucestershire, the wife of Robert Blagden, Esq., M.R.C.S., of a son.

DIVER.—On the 15th inst., at Camden terrace, Camden road, London, the wife of Thomas Diver, M.D., of Bombay, of a son.

HARRIS.—On the 14th inst., at Cavendish square, the wife of Francis Harris, M.D., of a daughter.

MORISON.—On the 18th inst., at Wellfield house, Wingate, Durham, the wife of John Morison, M.D., of a son.

MARRIAGES.

BAILLIE—MAIN.—On the 9th inst., at New St. Pancras church, Benj. T. B. Baillie, L.R.C.P. Edin., of Victoria crescent, Haverstock hill, only surviving son of the late B. Baillie, Esq., of Limehouse, to Sarah, eldest daughter of the late John Main, Esq., of Fitzroy square.

JACOB—M'CLEAN.—On the 13th inst., at St. Anne's Parish church, Dublin, Archibald Hamilton Jacob, B.A., M.D., fourth son of Arthur Jacob, M.D., of Ely place and Monkstown, co. Dublin, to Florence Elizabeth, youngest and only surviving daughter of Francis M'Clean, Esq., of Stephen's green, Dublin.

TILTON—ELLIOTT.—On the 14th inst., at Randwick church, Rowland Tilton, Esq., M.R.C.S., of Park villa, Stonehouse, Gloucestershire, to Isabella, third daughter of the Rev. J. Elliott, M.A., Incumbent of Randwick, in the same county.

MOREHEAD—CHASE.—On the 14th inst., at St. Marylebone church, Charles Morehead, M.D., late of H.M.'s Bombay Medical Service, to Georgiana Ann, eldest daughter of Licut.-Col. Chase, of Nottingham place, late of H.M.'s Madras Light Cavalry, and Commandant of the Hon. the Governor's Body Guard.

DEATHS.

HORSMAN.—On the 15th inst., Alfred James Horsman, Esq., of the London Hospital, aged 20.

TANQUEREL DES PLANCHES.—M. Tanquerel des Planches has just died, at the age of 53, on his estate near Mayenne, where he had retired from practice since 1848. He was the author of a classic work on 'Lead Colic,' to which the prize of the Institute was adjudged, and which has been translated by Dr. Dana, an American Physician.

TICE.—On the 10th ult., on board ship, a few hours after leaving Calcutta, Dr. J. C. G. Tice, C.B., Deputy Inspector-General of Hospitals, aged 51.

MEDICAL NEWS.

UNIVERSITY OF LONDON.—The following are lists of candidates who have passed the respective examinations indicated:—FIRST B.Sc. EXAMINATION (ENTIRE). PASS EXAMINATION.—*First Division.*—Edward Hesketh Birkenhead, Government School of Mines; Dan Isaac Davies, private study; Clement Le Neve Foster, Government School of Mines. *Second Division.*—Edward Louis Barret, Royal College of Chemistry; Richard Bithell, private study; John Broughton, St. Bartholomew's Hospital; James Dale, private study; Edward Divers, Queen's College, Galway; Edward Maxwell Dixon, private study; Walter Flight, Queenwood College; John Joseph Kelly, private tuition; George Walter Knox, University College; John Spink, private study. FIRST B.Sc. EXAMINATION (EXCLUDING MATHEMATICS). *First Division.*—William Lant Carpenter, B.A., private study. *Second Division.*—Fred. George Finch, B.A., School of Mines and University College; William Hetherington Harris, B.A., private study. EXAMINATION FOR HONOURS. *Mathematics and Mechanical Philosophy.*—James Dale, private study. *Chemistry and Natural Philosophy.*—William Lant Carpenter, B.A., private study; Clement Le Neve Foster, Government School of Mines; Walter Flight, Queenwood College. *Biology.*—George Walter Knox, University College. BACHELOR OF MEDICINE.—PRELIMINARY SCIENTFIC EXAMINATION.—PASS EXAMINATION *First Division.*—Bryan Holme Allen, University College; Herbert Ray Archer, St. George's Hospital; Fred. Wm. Armitage, Guy's Hospital; Marcus Beck, University of Glasgow; Charles Berrell, King's College; Joseph Birt, Sydenham College, Birmingham; Thomas Bond, King's College; John Cavafy, St. George's Hospital; Carey Pearce Coombs, St. Mary's Hospital; George Eastes, Guy's Hospital; John Tasker Evans, St. Bartholomew's Hospital; Julien Augustus Michael Evans, University College; Frederick Flint, King's College; Charles Aug. Greaves, St. Thomas's Hospital; Thomas Henry Green, University College; Henry Charles Hilliard, Guy's Hospital; Philip Brooks Mason, University College; Marmaduke John Mayou, Guy's Hospital, Frederick Barham Nunneley, University College; Charles William Philpot, King's College; Revett Coleridge Powles, King's College; Charles Read, University College; Edwin Roberts, King's College; Charles Smith, Guy's Hospital; James William Smith, Guy's Hospital; William Vicary Snow, University College; Francis Thos Tayler, B.A., Guy's Hospital; Geo. Christopher Tayler, St. Bartholomew's Hospital; Arthur Taylor, Guy's Hospital; Henry Trimen, King's College Hospital; Eben Fulham Turner, Guy's Hospital; Thomas Pichard Warren, Guy's Hospital; Henry Willey, King's College; John Williams, University College. *Second Division.*—John Barrett, Bristol and Bath United Hospital; Charles Glen Bott, Guy's Hospital; Thomas Churton, Leeds; Henry Clothier, University College; James John Coxeter, University College; Oliver Thomas Duke, Guy's Hospital; William Soltau Eccles, St. Bartholomew's Hospital; Thomas Fairbank, St. Bartholomew's Hospital; Joseph R. Foster, Manchester; T. Robinson Glynn, St. Bartholomew's Hospital; Joseph Groves, King's College; Walter Anstice Harvey, St. Bartholomew's Hospital; James Pearson Irvine, Liverpool; James Jackson, London Hospital; H. Law Kempthorne, King's College; John Wickham Legg, University College; J. Lloyd, Queen's College, Birmingham; W. G. Vawdrey Lush, St. Bartholomew's Hospital; Edward Mackey, Queen's College, Birmingham; Thomas Murray, St. George's Hospital; C. Perks, Queen's College, Birmingham; C. Howard Prosser, Marlboro' College; J. Prior Purvis, St. Thomas's Hospital; John Henry Salter, King's College; George Henry Savage, Guy's Hospital; Alfred Baird Seaman, King's College; George Edward Shuttleworth, King's College; Robert Sidney Stone, St. Bartholomew's Hospital; Edward Francis Willoughby, University College. EXAMINATION FOR HONOURS.—*Chemistry and Natural Philosophy.*—Philip Brookes Mason (Exhibition), University College; Frederick Barham Nunneley, University College; Bryan Holme Allen, University College; Charles Berrell, King's College; Charles Augustus Greaves, St. Thomas's Hospital.—*Biology:* Philip Brookes Mason (Exhibition), University College; Revett Coleridge Powles, King's College; Edward Francis Willoughby, University College. FIRST M.B. EXAMINATION (Entire)—PASS EXAMINATION.—*First Division*: Alexander Bruce, University College; Wm. Carter, Charing-cross Hospital; Carey Pearce Coombs, St. Mary's Hospital; Gwynne Henry Harries, King's Coll.; John Wale Hicks, St. Thomas's Hospital; Jas. Hinds, Queen's Coll., Birmingham; C. Albt. Hingston, St. Bartholomew's Hospital; H. Law Kempthorne, King's College; George King, London Hospital; Daniel John Leech, Royal Manchester; John Morton, St. Thomas's Hospital; John Albert Nunneley, Leeds; John Jones Phillips, Guy's Hospital; Shepherd Thos. Taylor, King's College; Richard Thorne Thorne, St. Bartholomew's Hospital; John Sebastian Wesley, King's College; Henry Willey, King's College; John Henry Wood, King's College. *Second Division:* William Philipps Bingley, University College; Edward Casey, King's College; Fred. Pooley Edis, Westminster Hospital; Thos. Fairbank, St. Bartholomew's Hospital; James Jackson, London Hospital; Arthur Geo. Mickley, Guy's Hospital; George Oliver, University College. FIRST M.B. EXAMINATION (Physiology only).—Thomas Wemyss Bogg, University College; John Talfourd Jones, University College; George Thomas Mitchell Southam, St. Bartholomew's Hospital; Rickard Patrick Burke Taaffe, St. Bartholomew's Hospital. EXAMINATION FOR HONOURS.—*Anatomy*: Jno. Wale Hicks (Exhibition and Gold Medal), St. Thomas's Hospital; Carey Pearce Coombs (Æq.), St. Mary's Hospital; Charles Albert Hingston, (Æq.), St. Bartholomew's Hospital. *Physiology, Histology, and Comparative Anatomy:* J. W. Hicks (Exhibition and Gold Medal), St. Thomas's Hospital; William Carter (Gold Medal), Charing-cross Hospital; Alexander Bruce, University College; Charles A. Hingston, St. Bartholomew's Hospital; Gwynne Henry Harries,

King's College. *Materia Medica and Pharmaceutical Chemistry, and Organic Chemistry:* Alexander Bruce (Exhibition and Gold Medal), Univ. Coll.; John Wale Hicks (Gold Medal), St. Thomas's Hospital; William Carter, Charing-cross Hospital; Carey Pearce Coombs, St. Mary's Hospital; Charles Albert Hingston, St. Bartholomew's Hospital; Henry Law Kempthorne. King's College.

Apothecaries' Hall.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on the 14th inst.:—Joseph Brownridge, Hull; Walter Henry Cope, Buckingham street, Strand; John Quilla Couch, Polpuro, Cornwall; Richard Lloyd Robins, Church row, Marlborough road, Dalston.

Pharmaceutical Society of Great Britain.—The following are the names of candidates who passed the Major Examination as Pharmaceutical Chemists on August 20th:—John B. Bailey, Reading; William H. Kitchin, Whitehaven; Sanderson Flesher, Scarborough; Philip Marrack, Crediton; Joseph Ward, Nuneaton; and George Welborne, Grantham.

Appointments.—Dr. T. Bacon Phillip has been appointed Consulting Physician to the London and Brighton Railway Provident Society.—Mr. A. D. C. Walford has been appointed Superintendent of the Birmingham and Midland Counties Lying-in Hospital and Dispensary for Diseases of Women and Children.—Dr. R. Aldridge has been elected Medical Officer for the Union Workhouse and District No. 1 of the Yeovil Union, Somersetshire, *vice* Mr. Wm. F. Tomkyns, resigned.—Dr. F. T. Bond, late Professor of Chemistry and Dean of the Faculty in Queen's College, Birmingham, has been elected Curator of the Hartley Institution, Southampton.—Dr. J. Heygate, Consulting Physician to the Derbyshire General Infirmary, and Justice of the Peace for the County and Borough of Derby, and Dr. J. Hiteman, have been elected to the General Council of the British Medical Association as Representatives of the Midland Branch.—Dr. T. Burnie has been elected Resident House-Surgeon to the Birmingham and Midland Free Hospital for Sick Children, *vice* Mr. Wm. M. Whitmarsh, resigned.—Mr. J. D. Bird, late House-Surgeon, has been elected an Honorary Staff-Surgeon of the Stockport Infirmary, Cheshire; Mr. H. S. Gale has been elected House-Surgeon in his stead; and Mr. W. Barker has been appointed Assistant House-Surgeon and Out-door Visitor, *vice* Mr. T. V. Rayner, resigned.—Staff-Surgeon T. Fraser, of Pembroke Dockyard, has been appointed to Devonport Dockyard, *vice* Staff-Surgeon Wm. Folds, placed on the Retired List; and Dr. D. Lyall has been appointed Staff-Surgeon to the Royal Dock-yard, Pembroke, *vice* Dr. T. Fraser.—Dr. T. T. Pyle has been elected one of the Surgeons of the Seaham Harbour Infirmary, Durham. *vice* Mr. R. Orton, resigned.—Dr. Donald M'Iver has been appointed Resident-Surgeon to the Birmingham and Midland Counties Lying-in Hospital and Dispensary for Diseases of Women and Children, *vice* Mr. E. S. Machin.—Dr. J. Locking has been re-elected Medical Officer and Public Vaccinator for the Tealby District of the Caistor Union, Lincolnshire.—Mr. C. J. Trotter has been elected Medical Officer for the new Workhouse at Dean-House, near Holmfirth, Huddersfield Union.—Mr. R. Meredith has been appointed Public Vaccinator by the Guardians of the Dudley Union, Worcestershire.

Miss Nightingale, who has during the summer been hard at work upon the plans for the future training hospital for nurses, has been obliged to cease her labours for the present from ill-health.

To ascertain the Purity of Chloroform. — If a small piece of sodium is thrown into pure chloroform, no action whatever ensues; if, on the contrary, any impurity, such as alcohol, be present, then a disengagement of gas takes place.

Lunatics.—The number of persons who have been certified by the masters to be of unsound mind, pursuant to the Act 16 & 17 Vict., c. 70, is 555. The number of lunatics reported by the masters to the Lord Chancellor under the Act 8 & 9 Vict., c. 100, s. 95, has been 93.

Remedy for Small-pox. — The "Sarracenia Purpurea," or Indian cup, a native plant of Nova Scotia, is described as a remedy for all the forms of small-pox, by Dr. F. W. Morris, of Halifax, N.S. The peculiar action of the medicine, it is asserted, is such that there is seldom any pitting left to tell the story of the disease. It has been successfully tried in the hospitals of Nova Scotia.

Coloured Doctors in New York.—A short time ago Dr. Ray, a physician of colour, practising in the suburbs, applied for admission to the King's County Medical Society, his colour not being known to the majority of the members. He was on the point of being elected, when the fact was divulged, and a select committee was appointed to consider his eligibility. This, too, in a free republic!

The New Lunacy Act, just printed, contains an important provision for the privilege of allowing persons to be absent on trial, which extends to all classes of lunatics, whether in asylums, hospitals, or licensed houses. The power is entrusted to two commissioners in respect to hospitals and licensed houses; to two of the committee of governors of any hospital, and to two visitors of licensed houses. If after fourteen days the person do not return, he is liable to be retaken, as in the case of an escape, unless a certificate that his detention is no longer necessary be forthcoming.

The Case of Ovariotomy at Strasburg.—We have read with much interest the details of this case in the 'Bulletin de Therapeutique,' of the 30th ult., and from them we find that the incision made first was only a little more than three inches long; the operator was, however, in a later stage of the proceedings, obliged to increase it by another inch and a half. The cyst was multilocular, and when the principal tumour had been evacuated, M. Koeberlé attempted to tap the smaller cyst from within the large one, which proceeding caused a good deal of glutinous matter to fall into the peritoneal cavity. Nor was the tapping of the large cyst satisfactory, as the canula of the trocar was connected with an india-rubber tube, which was somewhat in the way. Adhesions between the cyst and the omentum had to be divided, the latter becoming the seat of some venous hæmorrhage. After the pedicle had been secured by a clamp, the bleeding omental veins were tied, and the latter returned into the abdomen, with the small intestines which had protruded. The ligatures were fixed to the clamp, and the abdominal wound closed by the twisted suture. Much uneasiness was occasioned by obstinate vomiting after the operation, and severe tympanitis occurred subsequently. The pins were gradually removed on the fifth, sixth, and seventh day, and replaced by bands secured to the abdominal walls by collodion; the ligatures became loose on the fifteenth and the nineteenth day. The clamp was removed on the sixth day, and replaced by pieces of bougies, which remained until the pedicle became detached; and on July 3rd, just one month after the operation, the lady, who is twenty-six years of age and married, was presented by the operator to the Medical Society of Strasburg.

The Colonial Hospital, Trinidad.—We have lately received the Report of the Colonial Hospital at Trinidad for 1861. This Institution, which is situated on the old site of the Orange Grove Barracks, has, during the last four years, received on an average 883 patients per annum. The patients have been from every quarter of the globe, and of every variety of man. The great mortality amongst the troops at the Orange Grove Barracks promised ill for the salubrity of an Hospital erected on the same ground. The experience of the last four years has, however, shown that the fault was in the building, not in the site. The average mortality of the troops in the barracks was 7 per cent., whilst that of the patients admitted into the Hospital has been 3 per cent. less. The report gives full particulars of the drainage, locality, and resources of the Hospital. The building is thus described:—"The Colonial Hospital consists of a main building with a façade 390 feet in length, running north and south, including the administrative offices, and at each extreme of the main building two short wings project into the rear. There is a ground-floor and an upper story. The ground-floor is divided by a grand central staircase into two wards, capable of accomodating 30 patients each. These wards are each 63 feet in length, 32 in width, and the space between the foot of each bed is upwards of 16 feet. They each contain 28,590 cubic feet of space, with 646 superficial feet of wall aperture, giving to every patient 953 cubic feet, or upwards of 317 cubic yards of air, being six times as much as the average amount of air allowed for each patient in the wards of five of our London Hospitals, and nearly eight of the Parisian Hospitals. The upper floor, accommodating 60 patients, contains 221,676 cubic feet, with 1,882 superficial feet of wall aperture, giving to each patient 3,695 cubic feet, or 1,231 cubic yards of space, being twenty-four times more than the English, and thirty times greater than the French Hospitals before named. This great space in the upper story arises from the space occupied by the front and back galleries of the basement story being embraced by the flooring of the upper story. On the score of ventilation then, and in absence of overcrowding, the Colonial Hospital is, perhaps, as perfect as could be desired, going in these respects far beyond the Model Hospital of the Royal Commissioners, as well as the principal Hospitals of England and France." The following extract, giving a picture of the hygienic and moral conditions of the Chinese labourers contrasted with that of the other coloured population is worth notice:—"As compared with their own section of the population, the Chinese show, from a total of 217, no less than 17·05 per cent. on admissions; and when it is considered that one-half of the Chinamen who came into Hospital are syphilitic patients, and that the remainder of those who came under treatment are more or less debilitated, if not absolutely enervated and ruined in constitution by depraved and immoral habits, more particularly those destructive habits of smoking and chewing opium, the question arises whether it be not possible to devise means, altogether apart from mere Hospital treatment, which deals only with effects, for remedying this state of things among that fractional part of the population. It is highly probable that the exclusive prevalence of syphilis among these immigrants is traceable to the difficulty experienced by Chinamen in forming matrimonial alliances with the coloured Creoles of the island, as well as to the non-introduction to the colony of Chinese female immigrants of their own class simultaneously with the males. This difficulty, however, is gradually undergoing the modification which time usually produces, and, though still existing to a large extent, yet some inter-

marriages of a recent date show that the antipathy of the industrial class of coloured Creole women is not so strong towards the Chinese settlers and immigrants as formerly. Nevertheless, many of them have sunk into an effete state of physical debasement; and illicit association with the most abandoned class of our population is not uncommon amongst them. It is with this class of females they contract the disease referred to, which would scarcely have formed an appreciable element in our Hospital practice for the past year, were it not that 200 Chinamen, out of a mixed population of 56,000 people, contribute no less than 33 per cent. towards the total number of syphilitic cases treated. It affords me great pleasure to place on record, in juxta-position with this disagreeable fact, that the native population of Port of Spain and neighbouring wards, numbering, as I have said, 55,000 persons, less the 200 Chinese referred to, contribute only four cases of syphilis out of the 58 treated during the year." The report, as a Medical state-paper, is highly creditable to its author, Dr. Richard Mercer, the Resdient Surgeon.—'Medical Times and Gazette.'

The Gorilla Controversy.—M. Du Chaillu, during his late residence in Paris, has brought to the verge of publication a translation of his travels in the Gorilla country, in which the narrative of the voyage is placed in the order of actual events. The work will be published in a few weeks. Stuffed specimens of the red-rumped variety of the female gorilla and of the young male have been placed for some weeks in the large glass case with the old male, in the Zoological Gallery of the British Museum. It is said that the kooloo-kamba and nschcigo m'bouvè varieties of chimpanzee will also be shortly exhibited in a stuffed state. The specimen of *Cynogale* (s.g. *Potamogale*) *velox*, alleged by M. Chaillu to have been a fish-eating carnivore like the otter, but allied to the Maimon (*Cynogale Bennettii*) of Borneo, a conclusion in which that gentleman was supported by many zoologists, both in Europe and America, has been placed by Dr. Gray amongst the musk-rats, and erected into a new genus, described in the Transactions of the Zoological Society as *Mystomys*, Gray.

M. Claude Bernard.—M. C. Bernard, Professor of Medicine at the Imperial College of France, and Professor of General Physiology at the Faculty of Sciences of Paris, has been promoted to the rank of Officer of the Legion of Honour.

Academic relations of Professors and Tutors.—I apprehend that we shall all aim at sound medical culture. Now this implies two things—namely, competent teachers, with sufficient means and encouragement for teaching; and sufficient curricula and plans of study for the student. I will not now venture to give an opinion whether in teaching we should adopt the professorial or the tutorial method, but it will be useful to know what is a tutor and what a professor in the academic body. The professor, I apprehend, is a teacher who, starting from the knowledge already acquired in his department, continually adds to it or corrects it by new researches. He leads the way to "fresh fields and pastures new" of science and art; by both precept and example he incites the student to thought and inquiry; and thus he not only maintains the reputation of his university by his own labours, but widens its fame as a school by the reputation of his scholars. The tutor I apprehend, occupies relatively a less advanced position in the academic ranks. His duty is to communicate positive knowledge (or what is held to be such) to the student, who is at the university not simply to acquire knowledge and be subject to mental discipline, but to acquire knowledge to the end that he may pass those academic examinations which are intended to test the amount of his acquirements. Hence the tutor has to follow and digest the results of original researches, rather than engage in them himself, to the end that they may be presented in a convenient form to the student for a degree. Now this kind of teacher already exists, and is popularly known as a "grinder," and it may be worthy consideration whether a recognised academic position should not be given to this class. For my own part, I should be glad to encourage academic tuition in my own department in every practicable way. Unfortunately, two difficulties meet us in the outset—namely, the want of time, and the want of money on the part of the student. Still, these are not so insuperable that the attempt to provide this kind of tutorial teaching should not be made.—Dr. Laycock.

University of Edinburgh.—Degrees in Medicine.—The "capping" of 109 graduates of the University of Edinburgh, who had passed the examination for the degree of Doctor of Medicine, took place on Friday, August 8, in the Assembly Hall, in the presence of a large number of spectators. Principal Sir David Brewster presided on the occasion, and he was surrounded by the other members of the Senatus Academicus. The proceedings having been opened with prayer by the Rev. Professor Crawford, the names of the graduates were intimated by Professor Balfour, and the young men were "capped" in succession by the Principal. The following is a list of the graduates—those who obtained prizes for their dissertations being marked *a*; those deemed worthy of competing for the dissertation prizes, *b*; and those commended for their dissertations, *c*:—Scotland.—*a*James Watt Black, M.A., Aberdeen; *c*Thomas Brisbane, *b*James Crichton Browne, Thos. Cairns, *c*William Watson Campbell, James Christison, Robert James Blair Cunynghame, Alexander Dewar, James Dewar, *c*Forbes Dick, James Dickson, *c*John Duncan, M.A., Edinburgh; *c*George Fyfe, James Gentle, Peter Gentle, James M'Ewan Girdwood, William Gordon, James Grant, James Hardie, John Hope, Patrick Cruickshank Houston, M.A., Aberdeen; *c*William Ketchen, *c*John Lightbody, John Macdougall, *b*Alexander Johnstone Macfarlan, James Robertson M'Iver, John Mackenzie M'Lean, B.A., Edinburgh; Roderick Macleod, *c*Robert Macnair, M.A., Glasgow; John Vicary Thatcher Malcolm, Peter Maxwell, *c*John Laidlaw Milligan, Peter Muir, *c*Claud Muirhead, William Muir Muirhead, David Murray, James Neilson, Andrew M'Lennan Rattray, Arthur Grant Reid, David Renton, Adam Robertson, James Davison Robertson, *c*David Ross, William Russell, John Shepherd, Francis Skae, *c*Andrew Smart, John Smith, *c*John Gordon Smith, *c*Walter Somerville, Andrew Stephen, *a*Ramsay Heatley Traquair, *c*John Wallace, M.A., Aberdeen; John Watson Wemyss, George Vint Wright. England.—John Lovell Arnott, *c*Percy Boulton, *c*Thos. Lewis Brittain, Wm. Turnbull Brody, *c*Edward Clapham, *b*Richard Davy, Charles Maslen Deane, *c*William Henry Dixon, Harry Foote, Frederick Augustus Palmer Hains, William Jones, David Makin Kennedy, *c*Robert Turner Land, Richard Lord, Frederick Blabesly Mallett, William Nash, John Nicholson, *c*William George Ross, Edward Julien Sharood, *c*Ellis Frederick Thorold, William Nealor Thursfield, Richard Sobey Veale, George Edward Wright, William Smith Wright. Ireland.—*c*Robert Alexander, Alexander Tertius Carson, Alexander Carson Clarke, Robert Jolly, John Todd. South Wales.—John Williams. North Wales.—*c*Thomas Henry Hughes, *c*John Turner. Florence.—A. Arthur Gamgee- Canada.—Donald Maclean, George Whyte. New Brunswick.—Peleg Wiswall Smith. Nova Scotia.—Clinton James Morse. Jamaica.—John Duncan Niven. East Indies.—Charles Martin Russell. Bengal.—James Henry George Hill. Calcutta.—*a*Thomas Richard Fraser. Cape of Good Hope.—John De Smidt, *c*Duncan Reid, James Gerhard Reid. West Indies.—Henry Armstrong Cheesbrough. Mauritius.—Jules Labonté. Demerara.—Augustus Carmichael Forte. Monte Video.—*c*Valentine O'Connor Conyngham. Barbadoes.—*c*John Sealy Lynch Thomas. Bahamas.—Joseph Benson Corlett. Tasmania.—James Sommerville Hope. New South Wales.—Richard Fortune Blackwell. The following candidate received the degrees of M.B. and C.M.:—Charles Henry Groves, B.A., T.C.D., England. At the conclusion of the ceremonial, an address, "On the Academic Position of Medicine," was delivered by Professor Laycock.

Isle of Wight Infirmary.—A ball is to take place on Friday, the 22nd inst., under the usual patronage, in aid of the funds of this institution, which are in straitened circumstances, *according to a printed statement issued by the Chairman of the Committee, Augustus F. Leeds, Esq. The paper is a mysterious one*, and does not say much for his acquaintance with "Cocker." There is a deficiency of 534*l.* in the adding up of the expenditure (or else a wrong entry), which would make the balance, in round numbers, *against the Infirmary* 861*l. instead of* 328*l., as stated.* It is to be hoped that it is the smaller sum, and that those gentlemen who have taken upon themselves, as a class, to manage the Institution, will bestir themselves and get the money, or make way for those who will, by amending its laws and constitution.—'Hampshire Independent,' August 16th, 1862.

Barbarity at Pittsburg Landing.—We were greatly pained, as we passed along the road traversed by thousands, to see dead bodies lying in the mud of the path, day after day. They were privates cast off from the boats, or thrust out of the tents to which they had been taken when wounded, and where they had died. Some of them were bodies of rebels. Their open eyes and gradually blackening faces were a horrible sight, especially amid the crowd which always hung about the landing. After remonstrating with several officers on the inhuman practice and its bad effects on the soldiers, who saw how little they were cared for when dead, we succeeded in having them buried. A very similar scene was still in view when we left, at the log hospital on the hill, where was a pile of amputated limbs, just outside the back door! An admiring officer assured us, as we sorrowfully gazed, that it was the result of the labour of Dr. —— within, the famous operator from Ohio. We hope the trophies of his skill will not much longer be publicly exhibited.—'Chicago Sanitary Commission Report.'

Royal Medical and Chirurgical Society.—The Library was closed on Monday, August 18, and will be re-opened on Monday, September 15.

Discovery of a Human Skeleton at Kellet, in Lancashire.—A human skeleton has been discovered in a fissure in the limestone formation of this locality. No iron, bronze, or stone remains were found with it, nor any evidence of clothing or pottery. The fractured condition of the bones of the skull, from which a considerable proportion of the mineral substance has been abstracted, precludes any immediate conclusion as to the cranial conformation of the individual; or as to the possible period which has elapsed since the intentional or accidental burial in the fissure.

A Public Drinking Fountain has been erected in memory of the late Sir P. Crampton, at the junction of D'Olier-street, College

street, and Great Brunswick-street. It bears the following inscription, by Lord Carlisle:—"1862. This fountain has been placed here, a type of health and usefulness, by the friends and admirers of Sir Philip Crampton, Bart., Surgeon-General to Her Majesty's Forces. It but feebly represents the sparkle of his genial fancy, the depth of his calm sagacity, the clearness of his spotless honour, the flow of his boundless benevolence.

Fanny Warboy, aged thirty-two, a widow, was found guilty, on Wednesday, at the Central Criminal Court, on the charge of having been accessory before the fact to the felonious using of an instrument upon herself, in order to produce miscarriage. In consideration of the suffering she had already undergone, she was sentenced to only three months' imprisonment.

Dr. Strachan on Illegitimacy in Scotland.—The 'Montrose Review,' to which we are indebted for the notice of Dr. Guthrie's jubilee festival, gives an account of a lecture to young women on "Illegitimate Births," delivered by Dr. Strachan, of Dollar. He stated that want of chastity was prevalent almost solely amongst women of the working classes. He describes the disgrace as befalling, for the most part, the excellent seemingly pious young woman, well instructed in religion and morality. Of these, the most prone to fall are those who have longest hours of work, and least leisure, and especially domestic servants. He believes that in a certain district specified, 12 per cent. of the young factory women, and 36 per cent. of the domestic servants had illegitimate children. "The two classes are identical in education and early training, the only difference being that factory girls have abundant leisure after working hours, and unrestrained intercourse with their acquaintances. In the middle and upper ranks, free and open intercourse amongst young people of both sexes is quite unrestrained. Young men are permitted to visit freely, to spend the evenings, to enjoy amusements; they meet and walk with ladies in the streets, there being no false shame of being seen together. And it is found that all this has not the slightest tendency to diminish, but, on the contrary, greatly increases, mutual respect. It yields much enjoyment and reciprocal benefit. Gentlemen are refined and purified, and their manners polished, and ladies, I hope, have their intellects strengthened and improved. You cannot expect that girls will not only abandon all social enjoyment, but also all hopes of marriage, which they must do were they kept entirely from male acquaintances. You must therefore see the unreasonableness of the usual prohibition of 'no followers.' No followers! God Almighty, by his immutable laws of nature, has declared that they should have followers. Can we imagine that these immortal beings, with the same constitutions as ourselves, with intellects as great, with affections as keen, were sent into the world merely to minister to our needs and to submit to our caprices. It is the greatest tyranny to attempt to deprive them of the sweetest earthly bliss, that of virtuous love. And what must be the consequence? Try it on your own daughters. Tell them they must have no followers, no friends, no acquaintances, and, within a week, they will have entered on a course of concealment and deception, the first step on the road to ruin. I would also refer to the remarkable fact of the comparative freedom from this sin of young women of the working class in Ireland. I had lately an opportunity of talking with an intelligent Scotchman who had for many years been in a large farm in Tipperary. He assured me that no illegitimate birth had occured among his servants or workpeople, and that such births are so rare as to be a matter of wonder to the neighbourhood. After endeavouring to ascertain from him the reason of this, I became convinced that one great cause of this freedom from immorality is the number of saint days and holidays in the Roman Catholic Church. On these days, after a short time in church, the day is spent in dancing and other amusements; the young men and women mixing freely together; the maids uniformly returning home about nine in the evening; such a thing as young men and women meeting together at a late hour being quite unknown. These facts clearly prove that intercourse at timeous hours would not promote, but greatly diminish the prevailing immorality."

Testimonial to the Resident Medical Officer of the Guildford Dispensary.—Mr. J. M. Bright, the late Resident Medical Officer of the Guildford Dispensary, has received a substantial proof of public respect, in the shape of a testimonial letter from the clergy and principal inhabitants of the town, enclosing the sum of fifty pounds. The following is a copy of the letter:—"Guildford, July 15, 1862.—Dear Mr. Bright,—We have much pleasure in presenting you with the sum of fifty pounds, 'contributed by a few friends who have had opportunities of observing the unwearied zeal and intelligence with which you have laboured to promote the interests of the West Surrey Dispensary and of the new County Hospital.' We append the names of those who have joined in this work, and we trust that with God's help, and by pursuing the same honourable and useful course, you may attain that position in your profession which never fails those who give their hearts to their work. You have already experienced this result, which has obtained for you the esteem and regard of all classes, including those Medical friends who can best appreciate your care and skill in tending the sick, as well as the poor themselves, who have benefited thereby. We wish you God-speed in your new sphere of usefulness, and remain, your very sincere friends, R. J. Shephard, Treasurer of the Surrey County Hospital; Richard Eager, Senior Honorary Medical Officer of the West Surrey Dispensary; Giffard Wells, M.A., Honorary Secretary of the West Surrey Dispensary; T. Goodwin Hatchard, M.A., Rector of St. Nicholas, Guildford; Thomas Luldam, M.A., Rector of St. Mary's and Holy Trinity; Richard Shepherd, M.A., Stoke; R. B. Matthews (Oxon), M.A., Vicar of Shalford; and thirty-five of the principal inhabitants of Guildford." Even more gratifying, if possible, than the above, was the presentation made on the same day from a number of poor persons who have experienced Mr. Bright's skill and kindness. When they heard that Mr. Bright was about to quit Guildford, they determined that they would not be behindhand in the expressions of their gratitude, and accordingly a subscription was quietly set on foot amongst them, and carried on by persons entirely of their own class. In a few hours 2*l.* 7s. 3d. was contributed by 91 poor people, in sums varying from 1d. to 1s. With this they purchased a set of three silver spoons, and having had his initials engraved thereon, presented them to him with a suitable address. Mr. Bright has in his possession the little book with the names and subscriptions of all these poor people set down in their own handwriting.

Dublin Lying-in Hospital Statistics.—It appears, from a tabular statement issued by the Dublin Lying-in Hospital, the observations extending over the whole period of the existence of the hospital, that the proportion of male to female children born is about 12 males to 11 females; children dying in hospital, about 1 to 28; still-born, about 1 in 18; women having twins, or more, about 1 to 62; women dying in child-bed, about 1 to 80; women having three and four children at a birth, about 1 to 4,500.

APPOINTMENTS FOR THE WEEK.

Wednesday, August 27.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopædic Hospital, 2 p.m.

Thursday, August 28.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m. London Surgical Home, 2 p.m.—Ruptured Perinæum; Vesico-Vaginal Fistula.

Friday, August 29.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, August 30.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital 2 p.m.

Monday, September 1.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, September 2.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

The Physiological Treatment of Fractures. By W. Parker, Esq., M.R.C.S., &c. Bath: Noyes and Son.

Self-Supporting Dispensaries, their Adaptation to the Relief of the Poor and Working Classes. By John Jones, Esq., M.R.C.S., Senior-Surgeon to the Derby Self-Supporting Dispensary. London: John Churchill, New Burlington street.

NOTICES TO CORRESPONDENTS.

H. H.—We doubt if M. Trousseau's suggestion to attack morbific sporules in wounds with caustic will answer the end. There are two things to be remembered, the nidus as affected by the constitution, and the sporule that is deposited in it. Then again, the wound may be in an internal mucous surface—the lungs for example—and it would be difficult to cauterise that.

Chirurgus—The Society cannot be compelled to pay the fee, unless a written promise to pay can be shown. It would be a desirable thing if the Profession in this country would combine as they do in France not to give a certificate to any office without a fee.

W. C.—1st. There is no blame whatever.—2nd. You will in all prebability be obliged to pay your own costs, even if successful.

The Licence of the College of Physicians.

To the Editor of the Medical Circular.

Sir,—Not content with the creation of a new class of Licentiates, the London College of Physicians have I learn, thought proper to grant diplomas to these gentlemen as qualified in Medicine, Surgery, and Midwifery. How is it that whilst thus certified as competent in all branches of the healing art, they are not to be allowed to call themselves members of this potent institution? Many of the members were admitted without any examination, because they *then* happened to be University graduates,—a fact which would lead to the supposition that such qualification ranked in the eyes of the authorities as superior to any they could themselves confer,—and the remainder, unproven as such to be possessed of any surgical knowledge whatever.

Are these gentlemen, the Licentiates, proved by examination qualified in Medicine, Surgery, and Midwifery, to be considered as inferior to the members who are qualified in Medicine only? Surely, there are but few who will covet such distinction.

The recently concocted bye-law which prohibits the use of the title of Doctor to the whole college who are not graduates, is itself the best proof that all physicians have the "right by custom" to that designation; the University degree formerly gave the right to teach, the College diploma the right to practise, these things are altered, but the truth of the adage remains, "it is better to practise than to preach."

London, Aug. 19, 1862. I am, &c., LOOKER ON.

Mr. BAKER.—1st. No.—2nd. No.

Mr. NEWTON.—Received.

Dr. PHILLIPS.—Yes.

Mr. MASKELL.—Received, and attended to.

AN OLD SUBSCRIBER.—On the assumption that the hæmorrhage was slight, and dependent upon hepatic congestion, it would *not* be advisable to administer strong astringents at first. The state of the portal circulation should be attended to. Much depends upon the *amount* of the hæmorrhage.

W. H. B. writes:—"May I trouble you to inform me in your next impression under 'Notices to Correspondents,' in which number of your Journal there is a County Court action brought by a Surgeon, to recover his fee, for an *engagement* to attend a patient during her confinement, the patient afterwards calling in another Medical man to attend her."

[We have not time to hunt through the copies of the MEDICAL CIRCULAR to find the report of the case. We have a distinct recollection of it, however, and that the decision was in favour of the surgeon who was a party to the original contract. Perhaps one of our readers, having leisure, will assist our correspondent in his search.]

QUERIST.—The amount is made up by receipts from advertisements. We regard the conduct of the Association as mean and derogatory.

A FIRE EATER.—Your letter is amusing, but we have no space for it. Perhaps the Editor of the Association Journal would publish it. Try.

MEDICAL EDUCATION.

To the Editor of the Medical Circular.

SIR,—Independently of the many palpable injustices consequent on the present exclusive system, let us for a moment contemplate a case, that of a highly-educated Medical man with several sons, and plenty of time at his disposal; however much time he might have devoted to the education of those sons in particular departments of knowledge, and however much they have profited by his teaching, he is nevertheless bound to purchase attendance on lectures and certificates for those sons from other men, possibly less competent than himself. Surely there is something radically wrong in this. Then again, as advocates of the Cottage Hospital system, by the introduction of which a large proportion of lives will be saved after the great operations as demonstrated by the results of operations in private practice, what chance is there of the correct principle being adopted, whilst the Colleges and Universities only recognise the Medical and Surgical practice of huge hospitals? It is preposterous to say that an intimate knowledge of Medicine and Surgery cannot be gained in well-conducted Union Workhouses with proper wards set apart for the sick, as well as in small hospitals. In such institutions, and in private practice, I for one gleaned far more practical knowledge than in huge hospitals, where patients are usually surrounded by a mass of students, and only to be satisfactorily seen during the visits of the surgeons and physicians, by very few, and the same patient, possibly, not so seen by the same student two days in succession. I am, &c., M.D.

Mr. D. O. EDWARDS.—Your communication came to hand at the time we were going to press.

St. Bartholomew's Hospital and MEDICAL COLLEGE.—The WINTER SESSION will commence OCTOBER 1, with an Introductory Address by Dr. MARTIN, at Four o'clock p.m.

LECTURES.

Medicine—Dr. Black and Dr. Kirkes.
Surgery—Mr. Lawrence and Mr. Coote.
Descriptive Anatomy—Mr. Skey, and Mr. Holden.
Physiology and General Anatomy—Mr. Savory.
Chymistry—Dr. Frankland.
Demonstrators of Anatomy—Mr. Callender & Mr. Smith.
Demonstrator of Morbid Anatomy—Dr. Andrew.

SUMMER SESSION, COMMENCING MAY 1, 1863.

Materia Medica—Dr. Farre.
Botany—Dr. Harris.
Forensic Medicine—Dr. Martin.
Midwifery—Dr. Greenhalgh.
Comparative Anatomy—Mr. Callender.
Practical Chymistry—Dr. Frankland.

The Hospital contains 650 Beds, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows, Dr. Farre, and Dr. Black; on the Surgical Cases, by Mr. Lawrence, Mr. Skey and Mr. Paget; and on Diseases of Women, by Dr. Greenhalgh.

Collegiate Establishment—Students can reside within the Hospital walls, subject to the collegiate regulations. Some of the Teachers connected with the Hospital also receive Students to reside with them.

Seven Scholarships, varying in value from 20*l.* to 50*l.*, are awarded annually. Further information respecting these and other details may be obtained from Mr. Paget, Dr. Martin, Mr. Callender, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomica Museum or Library.

Human Osteology. Messrs. MILLIKIN & LAWLEY, Surgical Instrument Makers, 161 Strand, "adjoining King's College," have a large assortment of Skeletons, Skulls, Hands, Feet, separate Bones, &c.

Articulated Skeletons, from £5; Disarticulated, from £3; Skulls, from 15s.

A Priced List sent post free on application.

N.B.—A variety of specimens of Cutaneous Diseases.

Julia Pastrana, embalmed, standing erect, dressed as in life, is pronounced by the Medical Profession to be the greatest scientific curiosity ever exhibited in London. Burlington Gallery, 191 Piccadilly. Open from 11 to 9. Admission, One Shilling.

Aloina.—The discoverers of this (vide 'Edinburgh Monthly Journal of Medical Science,' for Feb. 1851), the crystalline purgative principle of Aloes, continue to prepare and supply it. They have the gratification of knowing that the most eminent of the profession prescribe it, to the exclusion altogether of the various kinds of aloes.

Orders executed direct or through any Drug house, by T. and H. SMITH and CO., 69 Coleman street, London, and 21 Dukestreet, Edinburgh.

Bowles and Sons, Label and GENERAL PRINTERS, ENGRAVERS, &c., GEORGE STREET, MANSION HOUSE, LONDON, E.C. —Surgeons, Hospitals, and Dispensaries supplied with Gummed Labels and every description of Printing on highly advantageous terms, and of the most finished style and workmanship.

Dispensing Labels—Plain, 2d. per 100; Engraved, 4d. per 100. Blanks, 2d., 2½d., and 3d. per 100 Retail, 2d. per 100. Catalogues on application

Surgeons' Account Notes Wrapping Papers, Envelopes, &c.

Grosvenor-place School of MEDICINE, No. 1 Grosvenor place (adjoining St. George's Hospital).—Session 1862-63.

The Introductory Lecture was delivered on WEDNESDAY, OCTOBER 1st, at Three o'clock p.m., by Dr. CHOLMELEY.

WINTER SESSION.

General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Mr. Sharman.
Practical Anatomy—Mr. Lomas.
Chemistry—Dr. Wood.
Principles and Practice of Medicine—Dr. Leared and Dr. Cholmeley.
Principles and Practice of Surgery—Mr. Spencer Wells and Mr. William Adams.

Further Information may be obtained of Dr. Richardson, 12 Hinde street, Manchester square, W.

EXTRAORDINARY BARGAINS,

Fire-proof Safes Half-price.

—A Provincial Insurance Company having amalgamated with a London office, and having no further use for a considerable number of Wrought-Iron Fire-proof Safes and Deed Chests, lying at the chief and branch offices, have returned them to the Manufacturers to be sold for half their original cost. They were all made to order for the Company, at the Vulcan Safe Works, Birmingham, in 1861, have only been in use eight months, and are warranted FIRE and BURGLAR-PROOF. A printed description of the various sizes, inside fittings, cost and present price of each Safe and Cheat, sent post-free with M'Kenna, Morris, & Co.'s Illustrated Price List. To parties in want of a really good Safe, the advantages here offered must be obvious, as they may secure an article with the manufacturers' guarantee, QUITE EQUAL TO NEW, AT HALF ITS REAL VALUE, and to remove the doubt naturally felt in purchasing a second-hand article unseen, it is requested that parties will in no instance remit the money until the Safe is received and approved. They will be SENT CARRIAGE PAID to any Station, and if not found in every respect perfect and satisfactory, MAY BE RETURNED without any cost whatever to the party ordering it. For full particulars, address—M'KENNA, MORRIS, & CO., VULCAN SAFE WORKS, CUMBERLAND STREET, BIRMINGHAM.

Lithographic Printing by STEAM.—J. CROSS and SON execute in a superior style, on very moderate terms, every description of Commercial Lithography, Steel, and Copper-plate Engraving and Printing. Contracts with large consumers. Wedding and Visiting Cards, Invitation Notes, Envelopes, and every description of Fancy Stationery.—J. CROSS and SON, Lithographers, Engravers, Steam-machine Printers, and Stationers, 18 Holborn hill, E.C. Established 1813.—Works, Baldwin's gardens

Flour — (Essex) — War- ranted free from adulteration, to any part of London (not less than 14lbs.) carriage free. Whites, for pastry, per bushel (56lbs), 11s. 0d. Households (recommended for bread-making), 10s. 4d.; Seconds, 9s. 8d.; Wheat Meal for brown bread, 9s. 8d. Best fine and coarse Scotch Oatmeal. Address HORSNAILL and CATCHPOOL, Bullford Mill, Witham, Essex, or 355 Goswell road, City road, E.C. Directions for bread-making gratis. Terms Cash. A half-sack delivered free to any rail station 200 miles. German yeast.

ÆGLE MARMELOS, OR INDIAN BAEL.

Liquor Belæ, prepared from the unripe fruit, so much esteemed in cases of Diarrhœa, Dysentery, etc., also the Wine, Extract, Powder, and Preserve.

Descriptive accounts may be had on application to the Importer gratis

O. GOULD, CHEMIST, 103 OXFORD STREET, LONDON.

St. Mary's Hospital Medical SCHOOL.—The WINTER SESSION will commence WEDNESDAY, OCTOBER, 1st, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Dr. SIEVEKING, after which a CONVERSAZIONE will be held.

As an incentive to Clinical Study, the Medical Appointments in this Hospital, including FIVE HOUSE-SURGEONCIES, have always been open to its Pupils without additional Fee or expense of any kind: thus offering advantages, both professional and pecuniary, of far more value to the Student than any system of Scholarships or Prizes.

Physicians—Dr. Alderson, Dr. Chambers, Dr. Sibson, Dr. Handfield Jones, Dr. Sieveking, and Dr. Markham.

Surgeons—Mr. Coulson, Mr. Lane, Mr. Ure, Mr. Spencer Smith, Mr. Walton, and Mr. J. Lane.

Physician-Accoucheur—Dr. Tyler Smith.

Ophthalmic Surgeon—Mr. White Cooper.

Aural Surgeon—Mr. Toynbee.

Surgeon-Dentist—Mr. Sercombe.

LECTURES.—Medicine: Dr. Chambers, and Dr. Sibson. Surgery—Mr. Lane and Mr. Spencer Smith.—Physiology: Dr. Broadbent.—Anatomy: Mr. Gascoyen.—Operations on the Dead Body: Mr. James Lane. — Dissections: Mr Norton and Mr. Coombs.—Chemistry—Mr. Field.

SUMMER SESSION.—Midwifery: Dr. Tyler Smith and Dr. Grailly Hewitt.—Materia Medica: Dr. Sieveking.—Botany: Dr. Dresser. — Medical Jurisprudence: Dr. Sanderson.—Practical Chemistry: Mr. Field.—Ophthalmic Surgery: Mr. White Cooper.—Aural Surgery: Mr. Toynbee. Dental Surgery: Mr. Sercomb.—Comparative Anatomy: Mr. Mivart.—Natural Philosophy: Mr. Smalley.

Clinical Lectures on Medicine and Surgery are delivered twice a week, throughout each Session by the Physicians and Surgeons.—A Maternity Department is attached to the Hospital.

Students are required to perform the duties of Clinical Clerks and Dressers in each Session during the last two years of their curriculum.

PRIZES, &c.—A Scholarship in Anatomy of the annual value of 25*l.*—A Prize of 20*l.* for Students of the First Year.—Prizes in the several Classes, at the end of each Session, of the average value of Five Guineas.—Two Prosectors, who each receive 5*l.* and a Certificate.

The Fee for the Hospital Practice and Lectures required by the Colleges of Physicians and Surgeons, and the Society of Apothecaries, is 89*l.* 5*s.*, which may be paid by instalments.

A detailed Prospectus will be sent and further information obtained on application to

GEO. G. GASCOYEN, Dean of the School.

St. Mary's Hospital, August, 1862.

Established 1812.

H. Potter's Depot for his CELEBRATED LEECHES, TURKEY and other SPONGES, MEDICAL HERBS, &c., 65 FARRINGDON STREET, London, E. C.

For price and quality they cannot be excelled.

Priced Catalogues free to any address.

TO THE MEDICAL PROFESSION.

Charcoal Biscuits for In- DIGESTION, HEARTBURN, &c. &c., manufactured from the purest Vegetable Carbon. Sold only in tins, at 1s., 2s., 4s., and 8s. each, by J. L. BRAGG, Sole Manufacturer, 2 Wigmore street, Cavendish square, London.

Chemists and others allowed a liberal discount.

Post-office Orders made payable at the Old Cavendish-street Branch.

Plaster of Paris.—Stevens and SON'S superior Plaster, as fine and pure as originally prepared by them—packed in Tin—may be obtained of their successor, J. C. PART 186 Drury lane, London.

JOURNAL

OF

Practical Medicine and Surgery.

ART. 6276.

Success of Ovariotomy in France.—Indications of Treatment in Extra-uterine Pregnancy.—Conflicting Opinions on the Subject of Consanguineous Unions.

Two operations of ovariotomy have been almost simultaneously performed with success in France. We related one in our last number (ART. 6275); the particulars of the other are as follows:—On the 2nd of June, Dr. Kœberlé, Fellow of the School of Medicine of Strasburg, removed a multilocular cyst of the ovary, and the cure was completed on the 25th of the same month. Mr. Nélaton announced to the Academy on the 24th of June the happy issue of the ovarian excision performed by himself on the 17th at Neuilly, and is therefore entitled to claim priority of success in the new era ovariotomy appears to have entered in France. (*a*)

It is but just to remark that some of our provincial operators resorted to the procedure before Messrs. Démarquay, Kœberlé, and Nélaton, with results most gratifying to French surgery; but it is no less equitable to establish the fact that the operations performed at Saint-Germain, at Strasburg, and Neuilly, are the first which have been instituted in a scientific manner, in harmony with the precise indications supplied by recent, and searching inquiry into the nature and pathology of ovarian cysts.

Having made this distinction between the origin and the restoration of ovarian excision in France, we cannot but offer legitimate congratulation to the two skilful provincial surgeons, who preceded in the path of success the eminent Professor, whose exertions have revived a question which had been allowed to drop, and who, by promulgating fixed rules for its performance, has reinstated in popular opinion an operation condemned by many of his illustrious colleagues. We therefore join the *Union Médicale* in stating that in 1847 Dr. Vaullegeard, of Condé-sur-Noireau, effected a cure in the case of a girl aged twenty-five, by the removal of a plurilocular cyst of the right ovary. We find, at a more distant date, recorded in the present journal (ART. 3349), an extremely interesting case of ovariotomy, performed with success, May 1, 1844, by one of our subscribers, Dr. Woyeikowski, at Montfort, near Quingey, in the Département du Doubs.

The case was, at the time, noticed in various French and foreign periodicals, and it may possibly have suggested in America and in England, the attempts which were so harshly treated at the Academy of Medicine in 1856 and 1857, when the solitary voice of the much-to-be-regretted Cazeaux was alone raised in their defence.

The reprobation showered at the time on ovariotomy doubtless arose from temporary prejudice, and from too sanguine anticipation of the curative effects of the iodine injections. Since this period only, have surgeons become convinced of the inutility of these injections into cysts containing a ropy fluid, and Messrs. Jules Worms, and Nélaton, disheartened by unvarying failure, have instituted a more careful inquiry into the value of ovarian excision. It is needless to dwell on the subject, but we will briefly allude to Mr. Woyeikowski's operation, for the benefit of those among our readers who may not possess the eighteenth volume of the collection of the present Journal.

The diagnosis of the case was somewhat obscure. Extra-uterine pregnancy was suspected, deceptive pains analogous to those of labour had set in, and it was in some measure accidentally, that in his endeavours to extract by the Cæsarean section a fœtus supposed to exist in some part of the abdominal cavity, the surgeon happened to find a scirrhus of the ovary which he boldly removed at once.

The patient was also affected with ascites, and thirty-two quarts of citrine-coloured fluid were withdrawn with the trochar. Gastrotomy was then performed by Dr. Woyeikowski, in the presence of Messrs. Mourcey, Matusewiez, and Gannard. The linea alba, aponeurosis, cellular tissue, and peritoneum, were cautiously divided in succession, and upwards of twenty-eight quarts of liquid escaped from the incision. A scirrhus, involving the right ovary, was then found attached to the fundus of the uterus, by a pedicle three inches in length and half an inch in thickness; this was secured with a ligature sufficiently long to lie outside the wound, and the tumour was extracted. It weighed seven pounds and a half, its structure was lardaceous, and interspersed with abscesses, and the remnants of the Fallopian duct, and of its fimbriated extremity were plainly discerned.

The operation lasted eight minutes.

"I hastened," said Mr. Woyeikowski, "to close the wound with the quilled suture (eight threads and four diachylon bolts), and cold-water embrocations, renewed every five minutes, were applied throughout the day. Strict abstinence from food was enjoined, and only a few spoonfuls of cold lemonade were allowed. On the 2nd of May, twenty-four hours after the operation, neither feverishness nor abdominal pain were present. The patient slept during the following night, and on the 4th, healthy suppuration set in. The ligature soon fell away, and twenty-five days after the operation, the woman was enabled to walk about, the abdomen being supported with a belt similar to that used in pregnancy for a similar purpose."

The author further remarks that this patient has since given birth to two fine boys, a circumstance which invalidates the assertion of Hippocrates that the male fœtus originates from the right, and the female fœtus from the left ovary. In the present instance, the right ovary had been removed.

— We shall leave to persons addicted to such inquiries, the task of ransacking scientific works for some previous instance of success of ovariotomy in France. For the present, we must consider the case above related as the earliest on record, and it will perhaps suggest some valuable hints calculated to guide the practitioner in the course to be adopted when the discrimination between extra-uterine pregnancy and ovarian tumour is a source of difficulty and embarrassment. When death is impending, it seems obvious that the surgeon's duty consists in resorting to gastrotomy as the only resource capable of prolonging life.

Baron Paul Dubois expressed in his lectures in 1846 a contrary opinion, which elicited from Dr. Woyeikowski the communication to which we have just referred:—

"It is often very difficult," said the learned Professor, "to distinguish extra-uterine pregnancy from ovarian disease, but the distinction is not one of considerable practical importance, because, in either case, surgical interference is equally perilous" (ART. 3252).

When extra-uterine pregnancy was unequivocally ascertained to exist, Baron Dubois deemed that the vaginal section was the only available resource, and he resorted to this procedure with success in January 1840, in a woman who had borne the fœtus for eighteen months. Gerdy was equally hostile to the performance of gastrotomy, and he stated before the Academy in 1841, that if labour-pains set in in a woman affected with extra-uterine pregnancy, and rupture of the sac was impending, it would be far better to allow matters to take their course, and let the woman die, than to kill her by useless interposition. This was likewise Mr. Danyau's sentiment. The contemporary authorities on the subject of obstetrics displayed marked aversion for gastrotomy as well as for ovariotomy; but the motives which now operate inversely in favour of the latter procedure, also tend to reinstate the former in public opinion: we, therefore, recommend the perusal of a paper illustrative of this tendency, recently published by a former interne of the hospitals of Paris, Dr. Lesouef, a pupil of Dr. Bernutz, entitled *Remarks on Three Cases of Extra-uterine Pregnancy* (*a*). The original intention of the author was to embody in a full description of this obscure subject, the results of his clinical observation; but he was

(*a*) We learn with much regret that Mr. Nélaton's patient has just died during a convulsive attack totally unconnected with the operation.

deterred by the difficulties of so arduous a task, and has confined himself to the communication of the cases which he has met with, and of the remarks they suggest. By a singular piece of good fortune, however, the three cases recorded in the memoir correspond to the three periods of the disease, and supply a sufficiently clear delineation of its symptoms, and of the most appropriate treatment.

In the first period the physician is perforce, inactive, because the abnormal pregnancy is not indicated by any definite signs, and the patients not unfrequently perish from some accident which no foresight could have guarded against. This actually happened in Mr. Lesouef's first case. But so untoward an occurrence in the early stage of gestation is not by any means constant, and five, six, and even seven months may elapse without peril to the patient's life. At this date, the elements of a correct diagnosis are attainable, and it is the unanimous opinion of all authors who have addressed themselves to the question, that the life of the mother may then be preserved by sacrificing that of the fœtus.

Mr. Lesouef does not inquire into the surgeon's right thus to destroy the infant, but assumes with most authors that the life of the mother must in the first place be secured by preventing the rupture of the fœtal sac. Various methods have been recommended for the premature destruction of the fœtus; the system which Mr. Lesouef considers the best, consists in reiterated and copious blood-letting, performed in such a manner as to abstract a large quantity of blood in the course of a few hours; he also recommends the application of pounded ice over the sac, and if necessary in the vagina, and of electricity, accumulated in a moderate sized Leyden jar, or by means of small batteries supplied with an electrometer; this latter mode is described as follows by the author, who has had recourse to Mr. Duchenne de Boulogne's great experience of the subject.

"The conductors should be covered with a thick layer of wax, leaving the olive-shaped extremities bare. One of the rods is inserted into the rectum, previously cleared of its contents by an enema, and is applied as closely as possible to the fœtal sac, carefully avoiding the mother's lumbo-sacral plexus. The other rod is then carried into the vagina, and the knob placed in contact with the anterior and inferior portion of the tumour. After these preliminary procedures, the rectal conductor is connected by an isolated chain with the outer coating of the Leyden jar, and the surgeon establishes the communication between the vaginal rod and the interior of the jar, with a conductor borne on a glass handle. The electric current is thus caused to pass through the sac, and must inevitably reach the fœtus."

Extra-uterine fœtation is not, however, always a cause of immediate death, and in some instances a fœtus has been known to remain, almost indefinitely, a harmless occupant of the abdomen. But before this state of innocuity can be attained, a critical time must be passed, viz., the period of labour which marks in these as well as in natural pregnancies the full development of the fœtus. Mr. Lesouef more especially directs his attention to the line of conduct to be adopted by the surgeon under these embarrassing circumstances, both as regards diagnosis and treatment. In Mr. Woycikowski's case, a strong suspicion of the existence of extra-uterine gestation was entertained. Mr. Lesouef invites attention to a fact pointed out by Mr. Huguier as calculated to dispel all doubt; it is the dark purple colour of the vulva. This symptom Mr. Huguier regards as a most reliable sign of pregnancy whether intra or extra-uterine, whereas the growths developed either in the womb or its appendages, never give rise to the discoloration alluded to.

Mr. Lesouef then proceeds to inquire into the most appropriate course to be adopted when the preternatural nature of the pregnancy has been discovered, and here addresses himself to the very essence of the question. This part of his paper deserves every attention, and reproduces a host of considerations entirely applicable to the important operative procedures which have of late much preoccupied the Profession. The author begins by establishing as a principle that in all cases in which death is inevitable, surgical interposition must be immediate.

"Providentially," says he, "in many instances the fœtal portion of the cyst protrudes considerably into the vagina. It is then obviously appropriate to perform the vaginal section in which the peritoneum may escape injury. But should this procedure be impracticable, gastrotomy is the only resource. In the cases witnessed by the Author, the patients were allowed to perish unassisted, and this circumstance has powerfully impressed him with the necessity of active interference. But he concludes from his personal investigations, that the existence of peritoneal adhesions of long standing tends to diminish the perils of the operation, and he justly remarks that a knowledge of the fact has suggested the idea which some practitioners have carried out with occasional success, of imitating the proceedings of nature; Dr. Martin, of Lyons, for instance, opened a fœtal cyst with caustic potash, at the tenth month of extra-uterine gestation, and his patient recovered. (*a*) One year before, Mr. Rousseau, surgeon of the hospital of Epernay, resorted with benefit to six successive applications of the actual cautery in the course of one month, before attempting to penetrate into the amniotic cavity with the knife. (*b*). Mr. Rousseau did not remove the membranes or placenta, which in his opinion, assist the process of cicatrisation and should not therefore be violently detached. The method recommended by Récamier for the evacuation of the contents of hepatic cysts, is therefore here sometimes applicable. But in very urgent cases, when death is imminent, the surgeon must not allow himself to be influenced by the fear of compromising the interests of surgical art, but promptly have recourse to the knife, and listen only to the dictates of his conscience.

* * *

— A fresh communication has been made to the Academy of Sciences on the perils of consanguineous unions, by Dr. Brochard, physician to the Deaf and Dumb Institution of the city of Nogent-le-Rotrou. It confirms in every respect the notions expressed by Messrs. Boudin, Devay, Bemiss, Stow and other French and foreign observers. These opinions, however, are not universally adopted, and among the writers who question the accuracy of the prevalent views on the subject, we may more particularly quote Dr. Gilbert W. Child, whose mode of reasoning cannot be passed over without notice.

In a paper published by the *British and Foreign Medico-Chirurgical Review*, April 1862, Dr. Child maintains that an impartial inquiry into the manifold aspects of the question by no means justifies the sentence of absolute reprobation passed by physicians on marriages of this description. We are informed by the most antique tradition, that Abraham married his half-sister, and that Isaac and Jacob his son and grandson were each united to their first cousins. Now, if the unfavourable views entertained on the subject of consanguineous marriages were founded in fact, the twelve patriarchs, several of whom were the issue at the third generation of such unions, must have presented the signs of considerable physical and moral deterioration. And yet says Mr. Child, we may safely assert that such was not the case, when we reflect that these very men gave birth in the course of fourteen generations to a nation counting six hundred thousand fighting men, and forming, therefore, a population of ten millions at the lowest computation.

This is not Mr. Child's only argument; he inquires into the real value of the analogy alleged to exist between consanguineous marriages in the human species, and the crossings of domestic animals. Among animals well known in England, he adduces the instances of Comet, one of the most celebrated of ancient short-horns, and the sire of the best of actually existing races. The following is Comet's genealogy: *Foljamb* bred out of *Bolingbroke* and *Phœnix*, was the sire of *Favourite; Favourite* and *Phœnix* produced *Phœnix junior*, and the latter and *Favourite* were the sire and dam of *Comet*. A celebrated heifer called *Barmton* was the issue of four generations, of each

(*a*) 'Gazette Médicale de Lyon,' 1856.
(*b*) 'Gazette Hebdemadaire,' 1855.

of which the bull *Favourite* was the head. As a more recent illustration, Mr. Child mentions the bull *Sir Samuel*, bred in 1855 out of *Crown-Prince* and *Charity*, *Crown-Prince* being the issue of *Charity* and *Fitz-Leonard*. The Equine race would supply a host of similar instances, and to adduce but one, *Flying-Childers* one of the most famous thorough-bred horses on record, was the brother of his maternal great-grand sire.

Consanguineous intercourse between animals, is not, moreover, in itself contrary to natural laws, and the stock Dove is an illustration in point. As might, however, be expected, this mode of pairing has a tendency to exaggerate individual characteristics, and when the latter acquire morbid development, the race may degenerate; but if the parents are healthy, consanguineous intercourse, according to Mr. Child, in no wise leads to the production of disease in their issue, but only entails possibly a diminished degree of fecundity. These remarks must theoretically apply to the human kind as well as to the brute species, but are less susceptible of demonstration. The experiments which can be conducted with the closest attention in the case of animals, cannot pertinently be brought forward in support of a theory relating to man. It is not in our power to submit the circumstances of reproduction to predetermined rules, to select the parents, to eliminate diseased subjects, or to counterbalance a defect in one by the opposite quality in the other; neither can we place the infant in the conditions most favourable to its development and improvement. Direct experiment is, therefore, impracticable, and we have naught but statistical returns to guide us in our judgment. Now, Mr. Child considers these statistics as unsatisfactory; in the tables adduced by Mr. Bemiss, for instance, consanguinity, it is true, is taken into account, but not the state of health of the parents, nor the hereditary transmission of morbid tendencies. On the other hand, many conditions such as albinism, should more properly be viewed as personal singularities than as diseases. Further, how can we be expected to admit that the facts brought forward are simple facts of every day occurrence, when Mr. Bemiss's figures show but four idiots out of one hundred and ninety-two children, the issue of thirty-four consanguineous marriages, whereas in Mr. Stow's tables, bearing on ninety-five children born of seventeen marriages, the number of idiots is not less than forty-four—*i. e.*, upwards of forty-six per cent.? If in both these returns the idiotic condition of the children must be viewed as the consequence of the relationship of the parents, how are we to account for so widely different a result?

Mr. Child conceives that the opinion prevalent as to the perils of consanguineous unions has originated in purely theological grounds. The interdiction still maintained against them by the Church of Rome, was raised in England, says he, in 1540, by the Eighth Henry. This concession to human weakness was the object of much censure, and the infelicitous results of a few marriages between cousins were represented as a visitation of Heaven. Thus the legality of such marriages has proved an unavailing protection against a reprobation originating in religious feeling, which at a later date would seem to be justified by the teachings of comparative physiology.

But the doctrine is not, according to Mr. Child, fairly borne out in the human subject by impartial observation, and the following is his final opinion on this delicate question. Consanguineous intermarriages, *per se*, have no tendency to induce degeneracy of the species. For instance: a grandfather A. is affected with scrofula, and transmits the disease to his two sons, B. and C.; B. has two sons, D. and E.; C. has one daughter, F., who is first cousin to D. and E.; D. chooses a wife in a family entirely unconnected with his own, and free from any scrofulous taint; E. marries his cousin F.; in this case, says Mr. Child, the children of D. will have a far better chance than those of E., of enjoying a sound constitution, not, however, because E. has been united to his cousin, but because he has married a person in whose system lurk the same morbid tendencies he has himself inherited, and because her constitution is, in many respects, the counterpart of his own. Reverse the conditions, and the chances will be altered in a corresponding manner, and thus, according to Mr. Child, it would sometimes be safer for a man, as far as the health of the future children is concerned, to marry his cousin, than to select a wife whose family precedents are unknown.

Hence, a physician consulted on the point at issue, must above all take into consideration the data relative to hereditary transmission, inquire into the hygienic history of the family, endeavour to detect the peculiar features of each case, and frame his answer in accordance with the results of a carefully conducted inquiry, instead of evading responsibility by a general reply. This latter course would, doubtless, save him some trouble, but although more convenient, it is not equally consonant with a proper appreciation of professional duty.

Mr. Child not having read Mr. Devay's book, nor the more recent communications forwarded on the subject to the Academy of Sciences of Paris, was not called upon to notice the argument founded on the frequency of deaf-muteness among children born of consanguineous marriages; indeed, in the tables supplied to the public by Messrs. Bemiss and Stow, only two cases of dumbness, and one of deafness are to be found in a total number of two hundred and ninety-seven children, the issue of fifty-one marriages. On the other hand, our readers will find in another part of our present issue, a protest signed by the Chief Rabbi of the Paris Consistory, from which it would appear that in Israelite families the number of deaf and dumb subjects is by no means so considerable as Mr. Boudin's statistics would imply.

Art. 6277.

HOSPITAL OF LA CHARITE.

(MR. BEAU'S WARDS.)

Imperfect Systolic Contraction.—The Action of Digitalis on the Heart.—Angina Pectoris.—Valerian Baths in Diseases of the Nervous System.

We related in our last number various interesting cases of *angina pectoris*, attributed to the immoderate use of tobacco, and we now reproduce some of Mr. Beau's remarks on that disease. Angina pectoris being, however, closely connected with deficient systolic contraction, we must, in the first place, explain the nature of the functional disturbance which the Professor calls *Asystolia*, and mention the remedies which he usually prescribes for its removal.

By the term *Asystolia*, Mr. Beau designates a comparative inability of the heart to propel into the arterial system the blood received from the auricle. The left ventricle contracts inefficiently, the blood is incompletely expelled from its cavity, and the circulation is impeded both above and below the heart, in a manner characterised by the following symptoms: the patients complain of a feeling of *extreme tightness* about the heart; this sensation is an exaggeration of what is experienced on the receipt of unwelcome or distressing news, in which case a transient impediment in the systolic contraction of the heart, is undoubtedly produced. The ventricle contracts inadequately, nature attempts to compensate by increased frequency for diminished power, and the pulse becomes quick, small, and uneven. While these symptoms are induced by the empty condition of the arteries, an opposite series of manifestations is observed in the venous system. The over-burdened veins are filled to excess; the jugular veins are distended, and the countenance is swelled and acquires a purple hue; jugular pulsation, the venous pulse of Lancisi, is present, and indicates that the blood is thrown back from the right side of the heart, and if the overcharge is excessive, hæmorrhagic congestion, apoplexy, or serous effusion may be apprehended.

To this list of symptoms we may add pains transmitted to various parts of the trunk, neck, or arms, along the pneumogastric nerve, and by the intricate network of the cervical plexus.

These morbid phenomena are of course aggravated by violent exercise, walking, the ascension of a hill or staircase, because whenever the muscles are exerted, blood is forced out of their tissue, and as this fluid rushes towards the heart, it augments

the local obstruction. For a moment, that viscus by a temporary effort succeeds in getting rid of the overcharge, its pulsations become more frequent and assume the character of palpitations; but exhausted by this unnatural exertion, which it is incapable of keeping up beyond a short time, the heart again fills with the blood which has in the meanwhile accumulated at its inlets, and the oppression and distress become excessive. This may frequently be observed in cases of stricture of the aorta or of regurgitation, when the heart has expended all its energy in endeavouring to overcome the physical impediment created by the disease to the passage of the blood.

Asystolia is frequently, but not invariably, connected with valvular disease of the heart. Grief may sometimes directly impair the power of contraction of the muscular fibres of that viscus, and the same effect is occasionally induced by the contact of its tissue with impoverished blood; indeed, it is not improbable that dyspepsia, and its physical and moral causes, bring about in this manner a diminution in the vital energy of the central organ of circulation.

For anatomical change in the structure of the heart, medicine has no direct resources, but mere debility and feebleness of its contractile action is fortunately not beyond the power of our art. In the latter instance, the appropriate remedies are those calculated to restore its energy to the cardiac muscle, and this, general tonics and digitalis supply the means of doing.

In Mr. Beau's opinion, digitalis is a stimulant and not a sedative of the heart. It allays irritability in the same manner as food, which sometimes checks the delirium and convulsions consequent on extreme exhaustion. Digitalis was formerly resorted to merely in cases of palpitation, but Mr. Beau prescribes this drug whenever symptoms of enfeebled power of the heart are present. When, for instance, the turgidity of the countenance coincides with jugular pulsation, dyspnœa and an uneven, frequent, feeble pulse, Mr. Beau exhibits every day a teacupful of infusion of digitalis, and the symptoms speedily subside, the obstructed circulation recovers its freedom, the pulse returns to its wonted regularity, fulness and slowness, because, under the influence of the remedy, the power of propelling into the arterial system the whole amount of blood supplied by the auricle, has been restored to the heart.

It is, as we have just stated, in the shape of an infusion, prepared with four or five grains of digitalis leaves for a teacupful of boiling water, that Mr. Beau administers the medicine in question. One cupful is taken every morning, and if necessary, repeated in the course of day.

Digitalis is open to one objection which we must notice; it disturbs the gastric functions and occasionally causes loss of appetite, and a distaste for food. It is, if we except this drawback, a valuable remedy from which much benefit may be derived, and which effects surprising cures when the feebleness of the heart is unconnected with valvular disease. Its good effects become apparent on the third or fourth day of its exhibition, which may fearlessly be proceeded with, as long as it does not disorder the stomach.

We will conclude by a brief allusion to venesection which, under the circumstances we have described, would seem to be obviously indicated. Its efficacy is but temporary and deceptive. It relieves the patient promptly, it is true, by removing undue pressure from the venous system, but in this instance, as in chlorosis, the symptoms are merely palliated for a short time, and soon return with two-fold violence, because a corresponding diminution of the power of the heart follows increased anæmia, and the circulation becoming more and more impeded, dropsy, œdema, and, finally, mortification of the anasarcous textures rapidly supervene.

Testimonial. — The friends of Mr. Shorland, M.R.C.S., of Yeovil, have presented to him a superb tea-service, made by Hunt and Roskill, as a testimonial of the esteem to which forty years of professional service have entitled him.

Alcohol from Coal Gas.—A method of extracting alcohol from coal gas has been discovered by a young Frenchman, named Cotelle. The cost is stated to be 25 francs the hectolitre—about one-third of the usual cost.

The Medical Circular.

ON THE DIGNITY OF ANCIENT PHARMACY.

By M. DONOVAN, M.R.I.A.

Honorary Member of the Philadelphia College of Pharmacy.

As the discovery of direct remedies for derangements of health would be the natural object of research amongst those who, in the infancy of society, interested themselves in the relief of human suffering, so pharmacy would be cultivated long before the slower process of investigating the nature of diseases, or distinguishing them.

Pharmacy is, therefore, the most ancient branch of the medical art. Were a proof required of the dignified position which it occupied in the early ages of the world, it would be found in the preservation of its records from remote antiquity; for its benefits were universal, and all mankind was interested in their perpetuation.

There are many historical proofs of the honour in which pharmacy was held: not only did the physicians of emperors invent and compound medicines, but emperors themselves: princesses addicted themselves to the same pursuits; nay, we find prophets and apostles occupied in compounding formulæ. A few of the more remarkable instances will sufficiently establish this point.

The Emperor Aurelius, on the death of Demetrius, appointed Galen to be the compounder of the celebrated Theriaca. Galen was held in the highest estimation by the Emperor, and the appointment was a token of his friendship; for so much venerated was the art which produced a medicine of such extraordinary, or, as might well be said, extravagant virtues as it was supposed to possess, that none were raised to the office of compounder but physicians of the highest reputation.

Avicenna was physician to the Sultan of Bokhara, and also his grand vizier: he was the companion of princes and nobles, the first physician of his day, and the great leviathan of philosophy in the universities of Europe. There is evidence that he compounded with his own hands.

Menecrates, physician to Tiberius, invented and prepared the celebrated Diachylon—a plaster which has preserved an undiminished reputation for eighteen centuries, and will probably continue to do so for as many more.

Dioscorides, of Anazarba, the great authority for materia medica for ages, was physician to Nero, or, as some think, to Anthony and Cleopatra. Antonius Musa, of celebrity inferior to few, was physician to Augustus, from which prince he received honours and many proofs of friendship, in return for his having saved his life in a dangerous disease. Pliny says the disease was inflammation of the bowels, but Suetonius calls it a disease of the liver. His practice is worth mentioning in this case. This celebrated physician prescribed lettuces, cold baths, and cold drinks!

Menecrates, of Syracuse, the physician, friend, and intimate of Philip of Macedon, not content with the highest honours that could be conferred on him by his patron, assumed to himself the style and dignity of a god. He named himself Jupiter Menecrates, and appeared in public attended by an Apollo, and an Esculapius of his own creation. Philip, however, brought him to his senses by inviting him to a feast, where, while the other guests were enjoying the delicacies of the table, this new Jupiter was regaled with incense and perfumes at a side table. The god understood the hint, did not like the jest, and retired in confusion.

Democedes of Crotona, was the intimate friend and constant guest of Darius the Great, and such were his talents that, from being an obscure person of indigent circumstances, he rose to the highest rank, and was the founder of the reputation of the Medical faculty of Crotona. His history is curious, and a sketch of it will illustrate the treatment which Medical practitioners sometimes experienced at the hands of power. The facts are related by Herodotus.

Democedes when young was compelled by the irritable temper of his father to leave his home and seek his fortune. He settled at Ægina, but was so poor as to be unable to procure the instruments necessary for his Profession; yet such was his skill, and so great the character which resulted from it, that his income for the fourth year amounted in our money to nearly 1,000*l*. Polycrates, usurper of Samos, became his patron and retained him as his physician; but Polycrates, becoming an object of the unjust anger of Orœtes, governor of Sardis, was barbarously crucified by him, and Orœtes detained Democedes and others as slaves. Darius, disgusted at the crimes of Orœtes, caused him to be assassinated, and all his treasures and slaves, amongst whom was Democedes, to be brought to his capital. Darius one day in the act of alighting from his horse after hunting, chanced to overstrain his ankle, and having some Egyptian physicians about him on whom he placed great

reliance, he put himself under their care. These, however, according to the practice of their country, used rough measures with the limb, and twisted it about in such a manner as greatly to aggravate the injury. On the eighth day, the Monarch having passed a restless night, and being in great pain, commanded Democedes to be brought before him, for he had been informed of his skill. The latter, found amongst the slaves, was led forward in his rags and fetters. He at first denied his skill, fearing that to avow it might cause his further detention. But Darius was not to be trifled with, and he ordered the doctor's faculties to be cleared by the application of whips and goads, the very naming of which induced Democedes to confess himself not quite so ignorant. In fine, by the application of mild remedies, according to the Grecian practice, which was in this instance opposed to that of Egypt, the ill effects of the previous violent measures subsided, and a complete cure was effected. As a reward for his services, he received from each of the wives of Darius a goblet full of gold pieces. He soon became possessed of a spacious house, lived in splendour, and was a constant guest at the king's table; but the Egyptian physicians were not forgotten; their ignorance excited the wrath of the monarch, and for the crime of being excelled in skill by a Greek, Darius was about to spit them on stakes of wood—a sentence which would certainly have been executed but for the intercession of Democedes, who at length procured their pardon. A short time after, he proved equally successful with Atossa, the wife of Darius, who had a tumour in the breast, and having cured her, she aided him in a stratagem, and he escaped to his native city Crotona, where he founded a school of medicine. Owing to the great talents of its founder, this school soon acquired a high character, and shed its lustre on the whole Profession at Crotona, the physicians of which were at length considered throughout all Greece the most eminent of the faculty.

The crowned heads of antiquity personally devoted much of their attention to pharmacy, and contributed not a little to its *éclat*. A prince who had the welfare of his subjects at heart could not do better than encourage by precept and example the improvement of an art than which none ranks higher in point of utility to mankind.

We are informed by Josephus that King Solomon was celebrated for his knowledge of natural history. He spoke parables about beasts, birds, fishes, and trees, from the cedar to the hyssop that springs from the wall; of course their medicinal properties were a chief object of his study. When the celebrated Alexandrian Library was burnt during the siege of the city by Julius Cæsar, it is said that Solomon's "History of Plants" fell a sacrifice to the flames along with some fragments on magic. There is evidence that even before Solomon's time some of our most powerful and useful medicines were known, and their application in certain instances well understood. There is on record a prescription of those times, which is the earliest in the medical annals of the world, being 3,000 years old. If we can rely on the testimony of Nicolaus Alexandrinus, who lived perhaps 1,600 years ago, this prescription was originally compounded for no less a person than King David. From the little that can be collected on the subject, it would appear that the king had a consultation of physicians, and that they compounded for him a formula consisting of opium, aloes, saffron, lignum aloes, myrrh, and various spices made into an electuary with honey. Amongst its enumerated virtues, we find that it relieves melancholy—a state of mind under which the royal Psalmist seems in no small degree to have laboured at different times, and it is probable that nothing more effectual for procuring temporary relief could be produced in the present day than this most ancient prescription.

King Antiochus favoured the world with the invention of a supposed antidote to all sorts of poisons; for the despotic monarchs of antiquity seem to have lived in constant apprehension of the infusion of some mortal dose into their food. It consisted of some seeds and herbs, and instead of possessing the power of counteracting poisons, it could scarcely have had medical virtue of any kind. Absurd as its pretensions were, such was its attributed value that the prescription was engraved on stone at the entrance or most conspicuous part of the temple of Esculapius. Antiochus prescribed it for his son to whom he was exceedingly attached.

Attalus, the last King of Pergamus, famous for his knowledge of metallurgy, was also well skilled in medicine and pharmacy. He invented several medicines which acquired great celebrity, and compounded poisons and antidotes, the effects of which he proved upon sentenced criminals. Our present ointment of white lead, and some other formulæ which have descended to us, are of his invention. Marcellus has preserved the following prescription which this prince used to prescribe for diseases of the liver and spleen, for dropsy, and for improving a lurid complexion. It consists of crocus, nardus, indicum, cassia, cinnamum, myrrha, schœni flores et costus. These are to be made into a confection or electuary with honey to be kept in a silver box. The king's knowledge of metals taught him that the medicine would be injured by any other readily procurable metal.

Mithridates, King of Pontus, perhaps invented the celebrated antidote called "confectio Mithridati;" but he might have improved it only, for some ancient authors think that the worthless secret was communicated to him by the physician Zopyrus. This might have been the same Zopyrus that compounded an antidote against mortal poison, and against pain of the stomach, liver, or spleen, for Ptolemy, King of Egypt, probably Lathyrus. It consisted of costus, thus masculum, piper album, flores junci rotundi, cinnamomum, cassia, crocus, myrrha et nardus, made into an electuary with honey. It was named "Ambrosia." It is related that certain criminals having been compelled to swallow poison, some got the Mithridate confection and recovered, while others who did not get it died. Avicenna seems to have believed that Mithridates composed his antidote with his own hands, at least we may judge so from the emphatic language which he uses. He says, "Confectio Mithridati nobilis est confectio quam *fecit* Mithridates rex Ponti, et nominavit suo nomine, et *composuit* ipsam." The use of the words *fecit* and *composuit* in the same sentence seems emphatic. Mithridates dosed himself with this wonderful alexipharmick, but by constant use of it he became inconveniently poison-proof; for when he found it necessary to poison himself he could not, and was obliged to apply to a friend to stab him.

Juba the Second, the amiable and accomplished King of Mauritania, wrote books on natural history and on the virtues of herbs. Evax, a king of Arabia, wrote a book on medical botany, which he dedicated to Nero. Nero himself was a proficient in a branch of medicine which occasionally stood his friend. This imperial reprobate was in the habit of wandering about the streets of Rome at night in disguise, creating riots and committing all sorts of disturbances. He used on these occasions to get involved in pugilistic contests, during which he was often soundly thrashed, and seldom escaped without a black eye or two, and a face vying with the rainbow. Believing that this was not a very reputable appearance for an emperor, he had the grace to keep by him in stock an ointment which he made of an acrimonious herb called thapsia, or deadly carrot, mixed with frankincense and wax. After these drubbings he smeared his face with his ointment, and next morning was quite free, as Pliny affirms, from all proofs of his well-merited punishment.

Agrippa, King of the Jews, invented an ointment for debility of the nerves, which encumbered the Pharmacopœias of Europe until a few centuries ago. It bore his name, and so much did this narrow-minded monarch prize this secret, that he never could endure to communicate it to his subjects.

The Emperor Adrian is said to have possessed considerable knowledge of medicine and pharmacy, and he also favoured mankind with a royal antidote against all sorts of poison. It was called "Adrianum," and consisted of opium, henbane, euphorbium, and thirty-eight other ingredients of little power. The last royal medicine to which I shall allude is one composed in the sixth century by the Emperor Justin, which continued in use for nearly one thousand years.

The medical art was also understood and used for purposes which were not always the best by princesses. From Diodorus Siculus we learn some historical facts, disguised in fable, it is true, but probably having reference to real persons and occurrences. Hecate, the daughter of Perses, studied the compounding of poisons, and was the discoverer of aconite or wolfsbane. She made trial of every composition by mixing them with the food which was given strangers; for it was the custom to destroy all strangers that came to or were cast on the island. Being thus grown skilful in the art, this accomplished lady poisoned her father and usurped his crown. According to Diodorus she had two daughters named Circe and Medea. Circe was much addicted to the compounding of all sorts of medicines; she discovered the efficacy of various roots and herbs; learned much from her well-practised mother, but much more by her own industry; so that, as Diodorus believed, she left nothing to be learned by any that came after her that could advance the art. She, imitating the example of her excellent mother, turned her skill to an equally good account, for she poisoned her husband and usurped his crown, but perpetrated so many cruelties on her subjects that she was at length expelled the kingdom. Medea, however, turned her knowledge to humane purposes.—(Diodor, Sic. c. III.)

Cleopatra, Queen of Egypt, wrote treatises on medicine, especially on the diseases of women. She made extensive experiments on poisons, and contrived various cosmetics, which in her own case she turned to good account.

Beside crowned heads, the profession of medicine enumerates in its list some of the most eminent philosophers of antiquity, who also invented and compounded remedies. Pythagoras and Democritus travelled all over Persia, Arabia, Ethiopia, and Egypt, and had conferred with the world in the form of a book. Both of them publicly professed magic, but kept its mysteries secret. Pythagoras was certainly an extraordinary character: endowed with qualifications of the highest order, personal and mental, he commanded admiration and respect wherever he appeared. He was a celebrated wrestler, then a popular accomplishment, and was skilled in oratory, rhetoric, poetry,

music, and philosophy. On his return from his travels, he settled at Crotona in Magna Græcia, where he founded a school, as well as a new sect of philosophers. His celebrated doctrine relative to transmigration, he, in all probability, purloined from the Egyptian priests; but it is certain that he supported it in a manner which he himself must have known to be false. He pretended that the soul of his deceased friend Calliphon, conversed with him night and day, and gave him the important advice not to pass over a place where an ass had fallen down. On the whole, one would be disposed to consider this celebrated character as a highly talented and successful impostor. The following specimen of his pharmacy may be interesting. It was famed under the name of "Antidotum Pythagoras;" and we are informed that the great philosopher, having proved its efficacy, prescribed it for such of his dear friends as laboured under stomach complaints, in *all* kinds of which it was affirmed to be successful. Recipe, Iridos drachmas octodecim et scrupulos duos; gentianæ drachmas quinque; zingiberis drachmas quatuor cum semisse; melano-piperis drachmas quatuor; mellis q.s. Detur in modum nucis. Pythagoras also invented vinegar of squill; but the medical use of the squill was taught him by Epimenides.

Empedocles of Agrigentum, a philosopher and an eminent poet, was celebrated for his knowledge of medicine. Of such consideration was he amongst his countrymen for his talents and social virtues that they offered him the crown, but this proof of their affection he had the magnanimity to refuse. He was a believer in a modified doctrine of transmigration: according to his own account he had been a girl, a shrub, a fish, and finally, a philosopher. Could he have sincerely believed this?

Democritus, who had travelled to the same countries as Pythagoras in search of knowledge, seems to have been an equally eccentric genius; and such were his peculiarities that he was at one time supposed to be mad. He seems to have had a taste for chemistry; for he found solvents for different stones, made artificial gems and coloured them with metallic oxides, and invented an atomic hypothesis, which, however, had little resemblance to that at present known. The following is one of his prescriptions; it does not evince much skill in the selection of remedies: take the spinal marrow of a hyæna, mix it with his gall, and some old oil; and boil them all together: it was employed for all pains of the nerves.—(Marcellus.) In the book written after his travels, he has given a prescription which inevitably leaves him in the dilemma of being accounted either a most credulous fool or a consummate knave. It is a composition which enables a man to have handsome, virtuous, and fortunate children (Pliny). Miserably for the votaries of beauty, the prescription is lost. The characteristic of the ancient physicians is the attributing of inordinate powers and too many virtues to inconsiderable remedies; Chrysippus and Dienches each wrote a book, wonderful to say, on the medical virtues of cabbage.—(Pliny, Galen.)

I shall give but two or three more instances of illustrious persons of ancient times who occupied themselves with the practice of pharmacy. The prophet Esdras, while in exile at Babylon, amused himself with compounding a medicine of his invention, which, up to a few centuries since, retained a place in the Pharmacopœias in Europe. It consisted of no less than 150 ingredients, and one of these consisted of 40; out of which number the prophet calculated that one at least should be capable of curing. He might have shortened his prescription and his labours by directing a little of all the medicines known in the world at that time to be mixed together. Those who wish to compound this polychrest formula of 190 ingredients will find it in full detail in the work of Nicolaus Prœpositus.

It is not perhaps generally known that St. Paul was an amateur in physic: yet Nicolaus Prœpositus gives a formula which he calls Potio Sancti Pauli, and which, he says was invented by that learned apostle. It is the same heterogeneous medley as all the medical prescriptions of that age. St. Luke as is well known, was a physician; but I have not been able to gain any insight into his practice.

On consideration of this list of emperors, princesses, philosophers, physicians-royal prophets, and saints, who have in different ages of the world pursued the knowledge of medicine combined with pharmacy, we cannot fail to be struck with the antiquity and grandeur of the art, as it was then practised—a noble art cultivated for its own sake, without fee, but not without reward—as a branch of philosophy, and as an element of a liberal education.—'Dublin Medical Press.'

THE FRENCH CHAMBER OF DEPUTIES.—Twelve Doctors of Medicine are members of the Chamber of Deputies.

RUSSIAN HOSPITAL AT JERUSALEM.—Among the works now in execution at Jerusalem, under the auspices of the Russian government, is a hospital to contain sixty beds. The building has now reached the first floor, and will be completed during the present year.

REVIEW OF BOOKS.

Lectures on the Principles and Practice of Midwifery. By Edward Wm. Murphy, M.D. 2nd Edition, Enlarged and Revised.

Numerous books have appeared within these few years on the theory and practice of Midwifery, each having its peculiar merits. We read Dr. Tyler Smith's, to study what he has said about the physiology of parturition; Dr. Churchill's, to learn the statistics of obstetricy; Johnson and Sinclair's work, to get a knowledge of the practice of the Dublin Lying-in Hospital; then we have Dr. Simpson's numerous contributions, and, lastly, the copious Transactions of the Obstetrical Society, which is an "*omnium gatherium*" from all ranks of the Profession. Dr. Murphy has now presented the Profession with a new treatise on this popular subject. It is apparently his aim to give a census of the teachings and opinions of practitioners on difficult points in Midwifery, and to guide the judgment of the reader by the light of his own experience. This is a duty eminently conformable with the good sense and reflective cast of mind of the author, and we may add, therefore, that it is generally well discharged. We remark some omissions, however. Our readers know that an interesting discussion has been carried on for some time on the relative merits of turning, and the forceps in difficult cases; now, on opening the part of the work where we should expect this subject to be handled, we do not find a word about it. We conclude, of course, not that Dr. Murphy is unacquainted with the discussions that have been held, but that not valuing the new doctrines, he does not consider it necessary to enter into the controversy until more facts have been collected.

There is one point, however, of great practical importance, especially with reference to the dogmas beginning to prevail respecting the indications for the use of instruments; we allude to the statement originally made by Professor Simpson, that the danger to the patient is in direct relation to the protraction of the labour. Professor Simpson's dogma was framed upon the supposed authority of the statistics of the Dublin Hospital. Dr. Murphy has carefully examined the evidence on this subject, and has, to our mind, successfully attacked this position.

This being a second edition, it is unnecessary to give a detailed analysis of the work; we may add, however, that it is copiously illustrated with diagrams, is comprehensive in its scope, judicious in its counsels, and on the whole, the best hand-book for the practitioner, with which we are acquainted.

Enuresis (Incontinence of Urine) in Children and in Adults, &c. By Wm. Abbotts Smith, M.D.

The author has given us a brief outline of nearly all that can be culled from various sources on the limited subject of this *brochure*. Incontinence of urine is a very common, and generally a very obstinate affection; and the modes of curing it are necessarily as various as the manifold causes that produce it. We can recommend this little book to our readers.

Notes on Spa, &c. By Thomas Cutler, M.D. Fifth Edition.

The numerous editions which this hand-book has passed through, is the best testimony of its utility. To the scientific man, the pleasure-seeker, or invalid, visiting Spa, this book is indispensable.

General Debility and Defective Nutrition, &c. By Alfred Smee, F.R.S. Second Edition.

This little book contains many sensible observations, and shows a general acquaintance with the physiological, chemical, and practical bearings of the subject. We quote the following remarks because they have a personal interest for our readers:

"And now a few words upon the debility which is observed in the Medical Profession, which so often cuts off its more gifted members at a premature age. Beginning as students, they have to give the most intense study to the largest range of subjects that can possibly fall to the lot of the educated man. The burden of memory in anatomy—the debilitating effects of the dissecting-room—the exercise of high mental thought in the study of physiology and psychology—the complicated and widespread range of chemical and physical knowledge—the exposure to bad air, and anxiety in the wards of the hospital—the fear of passing the examinations necessary to become legally-qualified practitioners; and, when the diploma is obtained, the harass of maintaining a position, without adequate means, in the first years of practice, exhaust the nervous system, and draw off the power of nutrition before the period of success arrives.

"In the prime of life, overworked and unnourished, he follows his extensive business with a mockery of state; and got up, in manner and dress, with orthodox punctiliousness, he is compelled to roll incessantly all day long, and every day, over the London stones, in a carriage with fancy-coloured wheels, to let everybody know when the doctor passes by; and at the close of his day's labour he too often finishes at a banquet at one of his patient's, to which he

is sure to be welcome from the respect which he commands from his standing and knowledge.

"Such a career, sooner or later, is apt to bring on debility, which leads to disease, or produces a state which is unable to resist disease, which prematurely removes him from his family, and deprives the patient of his services.

"So much for the cause; now for the remedy. Ride less, walk more. If patients cannot be cured without a carriage, send one either before, or during, or after your visit. Steal a few hours, when best they can be spared, to unbend the mind, and develop the muscular system. Dig or walk, ride on horseback, row, fish, shoot, or hunt; or do anything which shall, though only for a few hours, once or twice a week, alter the current of the ideas, give freshness to the thoughts, fill the lungs with the pure air of heaven, and give strength and vigour to the muscular system.

"Depend upon it such a course is money gained to the Medical man, as he would take during a longer period a larger sum. It is a life gain, as it would prolong the duration of his existence. It is a gain to his patients, by enabling him to exercise freshness of intellect upon their ailments. It is a gain to his family, who would retain him amongst them for a longer period. It is a gain to society; for it takes not only great natural abilities, but many years of experience and study, to form a skilled Medical practitioner."

Medical Evidence in our Law Courts, &c. By Dr. James G. Davey.

Dr. Davey as an alienist, feels a deep interest in this question as affecting that class of practitioners. He is of opinion:

"'It is desirable for the sake of science, and not less for the honour of the Medical Profession, that, in all cases, of whatever kind, involving in any degree a knowledge of the principles and practice of medicine and its collateral branches, a plain statement of all the facts should be drawn up and submitted to a MEDICAL ARBITRATION,' and that then the 'various opinions' of Medical men 'would be found to approximate, and the Medical chasms which now appear would now be bridged over in an easy, graceful, and truthful manner.'"

No doubt this would be a reasonable and dignified method of settling the difficulty.

On the Therapeutic Action of Atomic Doses. By Arthur De Noé Walker.

We refer the curious in these matters to the pamphlet published by Mr. Walker; for our own part, we have no inclination to criticise a *brochure*, whose author would neither be corrected by our censure nor thankful for our praise.

On the Prevailing Ignorance of Materia Medica. By Arthur De Noé Walker.

Again, in the homœopathic interest, Mr. Walker's arguments could find no sympathy from Medical readers.

Medical Terrorism in 1862. By Wm. Bayes, M.D.

The author defends himself and Mr. Wm. Adams against the reproof of the Medical press. The case is too fresh in the remembrance of our readers to require further reference to it.

Vichy, &c. By Edwin Lee, M.D.

A very interesting account of Vichy and its waters, in Dr. Lee's usual perspicuous style.

Cocoa: its Growth and Culture, Manufacture, Modes of Preparation, &c. By Charles Hewett.

If anybody should desire all the particulars, botanical, chemical, geographical, dietetical, and physiological, connected with this favourite and useful food, he cannot do better than peruse this little work, which contains a marvellous amount of information in a very small space.

Notice of Menton, &c. By Edwin Lee, M.D.

We have already favourably noticed this pamphlet in another form; it is a compendious account of this favourite watering-place.

OUR NOTE BOOK.

SYNTHESIS OF ACETYLENE.

Berthelot's recent researches on acetylene have led to results which nullify the distinction usually made between inorganic and organic chemistry. We are indebted to Dr. Atkinson for the following notice of these researches, which cannot fail to gratify our scientific readers:—Of all the carburets of hydrogen, acetylene, $C_4 H_2$, is the most stable. It can be formed from olefiant gas or marsh gas by the action of heat, or by that of the induction spark; and it is also formed under the influence of the former agent from benzole and naphthaline, which have usually been regarded as the most stable carburets. Berthelot has succeeded in preparing this gas artificially by the direct union of its elements, hydrogen and carbon. Hydrogen may readily be obtained pure and dry, but this is not the case with carbon, which usually contains a variable proportion of hydrogen. This, Berthelot found, was best removed by the action of chlorine at a high temperature, which has further the advantage of removing sulphur, aluminium, and silicon in the form of volatile chlorides. Purified carbon is not acted upon by hydrogen under the influence of the highest heat alone, even when carried to the point of melting the porcelain tube in which the carbon was placed. Nor were experiments made with the induction spark more successful. But when the electric arc is formed between two charcoal electrodes is an atmosphere of hydrogen, combination takes place as soon as the spark commences to pass. Acetylene is formed, and is the sole product of the reaction, and its production continues as long as the electric arc is maintained; it can be reproduced indefinitely by the same charcoals so long as the transport of matter between the two poles has not entirely disaggregated them.

$$C_4 \text{ (carbon)} + H_2 \text{ (hydrogen)} = C_4 H_2 \text{ (acetylene)}.$$

The acetylene formed around the poles is carried away by the current of hydrogen, and is condensed in an ammoniacal solution of protochloride of copper, producing a red precipitate of cuprous acetylene. It is easy to obtain large quantities of acetylene in this way; under the conditions of the experiment, Berthelot was able to prepare about ten cubic centims. of acetylene in a minute. The compound of acetylene was treated with pure hydrochloric acid, by which acetylene was liberated in a free state; both its analysis and the comparison of its properties identified it. Acetylene is not an isolated substance, but presents a starting point for the formation of other bodies. Berthelot has shown that, by simple addition of hydrogen, it can be changed into olefiant gas; by means of olefiant gas, alcohol can be formed, and thus a commencement made with the chain of compounds which constitute organic chemistry. To all syntheses and progressive formations, that of acetylene furnishes the first step.—'Chemist and Druggist.'

NEW TEST FOR MORPHIA.

Mr. John Horsley, F.C.S., has noticed that morphia reduces nitrate of silver with great rapidity, and has come to the conclusion that this reaction is a most delicate and unexceptional test for the alkaloid. If one drop of solution of acetate or sulphate of morphia (one per cent. strength) be mixed with ten or fifteen drops of a solution of nitrate of silver (four grains to the drachm), and agitated for a minute or so, a fine white crystalline precipitate of frosted silver shortly takes place, the liquor acquiring a slight yellow colour, from the reaction of the liberated nitric acid upon the morphia; and on decantation, or filtration, and the addition of strong nitric acid, the usual orange-red colour of morphia is developed. If a white porcelain dish, containing the nitrate of silver solution, be slightly warmed previous to adding the morphia, the reduction is almost instantaneous, and the vessel coated with a film of silver. Gallic and tannic acids need never lead to any confusion with morphia, as their reaction upon silver solutions is very different, an intense muddy-black or brownish-black colour being produced almost immediately, and a flocculent precipitate forms, which is not the case with morphia, to say nothing of the other characteristics by which they are readily distinguished.—'Chemist and Druggist.'

IRONSTONE AND COAL MINING.—The medical officers appointed to report upon the trades and occupations of Wolverhampton state that bronchial affections and phthisis exist extensively amongst the miners. The prevalent chronic bronchitis appears to be slower in its progress than is the case among tin, copper, and lead miners—that the miners suffer in a mitigated form, and are more likely to recover.

LUNATICS IN 1861.—On the authority of the Sixteenth Report of the Commissioners in Lunacy just published, there were in county and borough asylums in England and Wales in 1861, 18,592 lunatics; in hospitals, 2150; in metropolitan licensed houses, 1953; in provincial licensed houses, 2150: total, 24,845. Of these, 4952 were discharged, 3138 having recovered; deaths, 2648. The total number of patients on Jan. 1st, 1862, was 26,200.

TYPHOID FEVER AT ROTHERHAM.—The Local Board of Health at Rotherham, some time since, adopted a system of drainage and water-supply calculated to effect a most complete sanitary improvement in the town; but owing to a deficiency in the funds, the water requisite to supply the increased demand arising from the great extension of the sewerage cannot be procured. The result is a most alarming spread of typhoid fever, most prevalent amongst the more wealthy portion of the community, who have been the first to secure a connection with the new sewers. The present number of fever patients cannot be less than 600 or 700. In six weeks there have been no less than fifty-six deaths arising from fever alone. There appears to exist, however, a determination to remedy the evil as early as possible.

THE MEDICAL CIRCULAR.

WEDNESDAY, SEPTEMBER 3, 1862.

MODERN THERAPEUTICS.

There is a general notion that we moderns infinitely surpass our ancestors in the arts of life; and Medical men in particular are prone to congratulate themselves upon the great advances which the practice of medicine has made during this nineteenth century. In illustration of the barbarous ignorance of our predecessors, some erudite archæologist will occasionally reproduce for the satisfaction of the curious, a prescription written by Dr. Caius, or Revirius, or perhaps, even his own great grandfather, who pottered away his time and industry among his simples and mineral oxides in some remote country village a hundred years ago.

We have all of us seen such prescriptions, including some dozen or twenty different articles, which have been dried and boiled and squeezed and macerated, and in numberless other ways subjected to thaumaturgical processes by which their marvellous virtues have been extracted, so as to be made operative on the peccant humours of the animal frame. We laugh and think ourselves much more sensible men than our grandfathers. We prescribe, now-a-days, in a far simpler manner. Three or four drugs in one prescription are quite sufficient to satisfy our ingenuity and cure our patients. Pathology is better understood, chemistry has revealed to us its many wonders, the correlation of forces is a new discovery. Though we despise homœopathy from the bottom of our soul, we still believe in occult influences, and look forward with hope to the grand climacteric of Medical science, when the laws of the conservation or conversion of forces being well understood, we shall be able to replace loss of heat in aged persons with a suitable dose of electricity, and re-excite motion in a clot of blood by the aid of a rarified sunbeam.

In our progress to this happy state of therapeutical perfection, we content ourselves with prescriptions of a very simple character. We abide strictly by the adjuvants, corrigents, and dirigents of Dr. Paris, and are satisfied with the results. Let us ask if there may not be a little delusion in the matter? Are our prescriptions really so simple as they appear? Have we any right to laugh in such a self-satisfied way at the elaborate combinations of our forefathers?

Here is a prescription:—

℞ Tinct. cinchon. co.	℥j.
Sp. ammon. arom.	℥ss.
Aq. Anethi	ad ℥iss.

ft. haust.

Few modern prescriptions are simpler than the foregoing; it contains but three pharmacopœial preparations, is reasonable in its design, and would in all probability prove efficacious. Does the reader know how many simple articles contribute to form this very simple prescription? Does he know further the actual quantities of the separate articles entering into it? If he do not, we will try to enlighten him—begging, however, beforehand, that we may be excused from solving the difficult arithmetical problem of the quantities. We do not profess such a mastership of the subject.

An old pharmaceutist—say the venerable Huxham—would have written the prescription in this ridiculous manner:—

℞. Rad cinchon. (Flav.)	q.s.
Cort. aurant	q.s.
Rad serpentar.	q.s.
Croci stigmat.	q.s.
Cocci	q.s.
Sp. vin. rect.	q.s.
Aq. destill.	q.s.

Macera &c., &c., et cola &c. Deinde.

℞ Amm., hydrochlorat.	q.s.
Potas. carb.	q.s.
Cort cinnam.	q.s.
Caryophill.	q.s.
Cort. limon.	q.s.
Sp. vin. rect.	q.s.
Aq. destill.	q.s.

Misce et destill., &c. Deinde.

℞ Sem. Anethi.	q.s.
Aq.	q.s.

M. et destill. Denique misce omnia pro haustu.

The last part of the prescription might have been varied by ordering the oil of dill and a little powdered flint.

This is the anatomy of the corpus of our simple prescription. We see that it is just as elaborate and minute as the most pedantic old pharmacologist could desire. Here are combined in one prescription, cinchona, serpentary, orange-peel, lemon-peel, saffron, cochineal, cinnamon, cloves, dill-seed, hydrochlorate of ammonia, carbonate of potass, spirits of wine, and water. It would be very easy to write a prescription, not over long, that should contain twice as many simple ingredients; in fact, the wholesale druggists now do the work which was formerly done by the apothecary himself in his laboratory.

We have given the details of these magistral preparations, not with any intention of dissuading our readers from employing them, because in the present state of therapeutics they are almost indispensable; but to show that our present habits of prescribing, as sanctioned by the highest authority, originate rather in a reliance upon the experience of others than in a personal observation of the action of individual drugs. We have been nurtured in an artificial system. We are the slaves of the manufacturing druggists, and our science is subordinated to a trade. Can we not alter this practice and adopt a greater simplicity in prescribing? After Dr. Parkes and Dr. Bennett have proved to us that pneumonia may be successfully treated by the mildest means, have we not a solid argument for recommending a closer attention to the action of separate drugs? Is it not very probable that three-fourths of the ingredients in the prescription we have just given are either superfluous or of no real use? There is no drug in more constant employment than ammonia; yet to this hour its operation in the animal economy is only vaguely apprehended. It is thought to be "good for the stomach," to relieve spasms, or revive from syncope; but apart from its properties as a "nervine," what is generally known of its action? How does it affect the blood? Is it a cure for scarlet fever, and for certain cutaneous diseases as stated by some authors?

It is unnecessary to dilate upon this subject. It has frequently occupied our attention in these columns, and the general tendency of our arguments must be well understood. We desire to know the specific qualities of drugs, and these can never be ascertained with precision whilst one drug is given in combination with a dozen others either resembling or differing from it in action. For this reason we hope that the Committee of Therapeutics appointed by the British Medical Association will receive the assistance of our readers, so that an ample body of evidence may be collected for future guidance.

THE WAKLEY TESTIMONIAL.

We have been asked to publish a statement relating to the proposed Wakley testimonial; but, as it is unnecessarily lengthy, we prefer to include the substance of it in an article. The upshot of the "Statement" is, that the attempt has failed. The Committee desired to collect one thousand pounds clear of all disbursements; and they now find that, when the expenses shall be paid, they will have in hand a balance of only 240*l*. The honorary secretaries were very diligent, for they sent letters to members of the legislature, to all the coroners in England and Wales, and to every member of the Profession; periodical meetings were held, a voluminous correspondence was maintained, canvassers, book in hand, visited the Profession in London, and the result of it all is thus described:

"The first disappointment was experienced from Mr. Wakley's parliamentary colleagues, for, with the exception of the members for Middlesex, with Lord Llanover and Mr. Edwin James, no encouragement was received from that quarter. Mr. Walter (of the 'Times,') M.P., in a frank and friendly letter to Mr. Edwards, appeared to express the general opinion of those gentlemen, and which was to the effect that, much as they respected Mr. Wakley, they did not consider his senatorial career so pre-eminent as to merit such an exceptional distinction as a public testimonial; and further, in Mr. Walter's opinion, that his services as editor of the 'Lancet,' 'had been sufficiently rewarded by the great success of that publication.'

"The conductors of the public press were equally cold, for setting aside the kind aid of the editor of the 'Morning Advertiser,' no notice was vouchsafed in any of these journals of the tribute designed for Mr. Wakley. Out of the several county coroners, too, not more than thirty sent subscriptions.

"It now became clear that the success of the subscription must depend upon the profession alone, but no doubt was entertained of the friendly intentions and goodwill of the various sections of this respectable body, or of their ability to accomplish the purpose proposed; nor is there any misgiving now.

"After some months, however, of exertion and active correspondence, accompanied, of course, with considerable and inevitable expense, the disagreeable conviction forced itself upon the minds of the committee, that the smooth course of the enterprise was impeded by obstacles."

The honorary secretaries describe the nature of these obstacles. Mr. Lawrence and Dr. Elliotson, who were alienated friends of Mr. Wakley, disapproved of the testimonial, and counteracted the efforts of the Committee. Dr. Watson, Professor Sharpey, Dr. Todd, Mr. Wells, and Dr. Ross, were unfriendly to a proposal to present a testimonial to a living man; and the honorary secretaries consider it a reproach to the editors of the Medical journals, that they refused admission, except in their advertising columns, to articles advocating the cause.

"Dr. Winter alone in England, and Dr. Jacob in Dublin, were generous enough to bestow any commendations upon the design and exertions of the committee."

We are happy to place on record the ineffectual generosity of those gentlemen. The 'Lancet,' too, appears to have been guilty of lukewarmness; for, with singular candour, the honorary secretaries inform us that, although Mr. Wakley seized upon the proposal with "characteristic frankness," yet the proprietors of the journal "exhibited from the first a nervous anxiety, lest the interests of the journal should be compromised by any shortcoming in the case of the testimonial." Earnest appeals were made to our personal "magnanimity;" and if we, as an ancient opponent, manifested only a moderate portion of that great quality we were expected to exhibit, the honorary secretaries ought not to be surprised, seeing that among Mr. Wakley's personal friends they could obtain no support.

Then there were difficulties of a subordinate character, one of which is stated to have been that of determining the nature of the testimonial, some wishing one thing and some another, the honorary secretaries wishing only that they had the money. It is now determined that the funds shall be applied to the foundation of a "Wakley Scholarship."

Although the document that has been forwarded to us is garnished with phrases imputing malice, literary jealousy, and other evil passions, as the cause of the failure of the project, we do not feel that these ill-timed and unbecoming expressions apply, in any degree, to the Medical Circular. We disapproved of the testimonial; we said so; but we allowed the promoters to succeed if they could. We neither helped nor marred, but we kept ourselves independent. We could not be hypocritical enough to praise a man who had exerted through a course of years all his talent and influence, direct and indirect, to do us wrong; nor would we degrade ourselves by standing between him and the testimonial which his friends might think he deserved. We were neutral; we threw personal feelings behind our back, and we allowed the movement to take its coure. Its failure shows that the profession did not want any prompting to condemn the project.

Do these honorary secretaries not perceive that it was their own imprudence that placed Mr. Wakley in a false position They failed to estimate the status of their idol both within the Profession and without, and were not satisfied until they had demonstrated in a manner most painful to the object of their indiscreet zeal. Every man makes his own place in the world, and that place is silently recognised by the public. Flatterers may pretend that it is higher or better, and seek, by testimonials, to perpetuate the fiction, but the attempt is vain. The memory runs rapidly over the events of a man's career, and judgment is passed instinctively upon his character and place.

Mr. Wakley was amply paid for what he did. He was eminently a successful man, as men of his mould commonly are. He did not labour for the public from a magnanimous motive, do patriotic deeds, confer great blessings, and die a pauper. He attained a political position, valuable office, and a large income; did his friends want a testimonial to bear witness to this success? Or to that wide and general esteem which attaches to purity of heart, disinterestedness of motive, self-sacrificing effort, and generosity of soul? All that he received in every way, he earned, and wherein he laboured he was paid in full. Mr. Wakley is dead, and it is not we who would revive memories that should be buried in his grave. The best service his friends can do him is not to disturb his ashes. There can be no objection to a "Wakley Scholarship," and we presume that so much, at least, will be accomplished.

THE BRITISH MEDICAL ASSOCIATION.

The Editor of the Association's Journal has made his defence. In doing so, he has indulged his taste for invective, but he has not refuted a single statement we have made, nor has he even attempted to rebut our most important accusations. He has kicked up a cloud of dust, and sloped away behind it.

He has associated the Medical Circular with he 'Lancet;' and, speaking of the latter journal, says, "He has even joined himself, for the business, in partnership with an acquaintance with whom he has heretofore lived on terms of the strictest *enmity!*" We did not imagine that we were so cordially hated by our contemporary; we knew, of course, that the editor of the 'Lancet' did not entertain friendly feelings towards the Medical Circular, and that he was not unwilling to do us an ill-turn when an opportunity offered,

but we had no conception of the intensity and strictness of the enmity of which it seems we are the objects. Is it not likely that the "enmity" is reflected upon the pages of the 'Lancet' from a certain disagreeable atrabilious source, not far from the inkstand of the editor of the 'British Medical Journal.'

The editor of the 'British Medical Journal,' whilst proposing to reply to our exposures of the journal, has been guilty of the artful subterfuge of associating us with the 'Lancet,' that he may pretend to have answered our arguments and statements, although noticing those of the 'Lancet' alone.

Our statements are unaffected by the abusive rigmarole of our contemporary. The facts remain that the liabilities of the Association are 666*l.* 17s. 2½d., every shilling of which must be paid, and that the assets from subscriptions (exclusive of other items) are 500*l.*, which it was admitted at the meeting must be regarded as bad debts! The Journal is the incubus of the Association, and the editor sits with all his weight to increase the load.

Are you content, members of the Association, to see your resources squandered upon a Journal, while your vital interests, as practitioners, are either disregarded or betrayed? We speak advisedly. On which side did your chief representative vote in the "Medical Council" on the Pharmaceutical question? With the College of Physicians, as against the interests of the provincial hospitals and the rural surgeons of England! Ask Sir Charles Hastings, and your Reform deputation of that day, whether they were not accessory to the introduction of the words "according to his qualification or qualifications," in the thirty-first clause of the Medical Act.

The editor boasts that London hospital physicians and surgeons are joining the Association. This is a bad omen for you, as you will find on the first occasion that the question of Medical Reform is discussed—*if it ever should be!* If you regard your own interests you will leave the Association to the "London Hospital Physicians and Surgeons."

Since this article was written we have perused another editorial lucubration on the subject in the 'British Medical Journal,' which, for undisguised coarseness, is unsurpassed. The 'Lancet' is charged with "sanctified dishonesty" and "unscrupulous malevolence;" we hope the members of the Association feel, for their own credit sake, some emotions of disgust, however slight, at this nasty "savour" of "Billingsgate," which the editor repudiates.

SUMMARY OF THE WEEK.

RICHARDSON ET UXOR *v.* POLLARD.

A report of this trial is given in another column. Our readers will see that Mr. Pollard was cast in damages to the amount of 120*l.* with costs for alleged malpraxis. The charge was that Mr. Pollard, in using undue force to deliver his patient, ruptured the perineum so that the rectum opened into the vagina, and that he did not discover the state of his patient for several weeks after the accident. Mr. Pollard denied the use of the violence ascribed to him; but in consequence of the meagreness of the report, we are unable to judge of the manner in which the manual force was used, or the probable degree of it. We know this—that nurses and attendants—and the patient too—often imagine that a great degree of force is employed when none is exercised. We do not place the least reliance upon the evidence of women in such cases. Again, is it clear that great force must have been used when there is extensive laceration of the perineum? We deny the proposition altogether. Laceration will take place under ordinary circumstances, and even during the exercise of the utmost care on the part of the practitioner. It is not necessary that the labour should be quick, though when the laceration takes place the expulsion of the fœtus is sure to be sudden, as an effect of the laceration, not a cause. Lacerations often take place after the head has been lingering long on the perineum. A surgeon may have his hand on the perineum; he may feel the tissues giving and cracking as the head advances; he may be sure that laceration of the integument will take place; he may see the commencing rent in the fourchette; he may manipulate in every possible way to prevent the coming catastrophe, or he may let it alone, and on a sudden the perineum will split under his fingers. The extent of the rupture must be discovered afterwards. The causes of this misfortune we cannot enumerate. It is only in recent years that this accident has received much attention from Medical men. The practice has been to throw the clothes over the patient, and give her time to recover; but this case shows that these accidents must be watched as one of the incidents of the labour. We can only blame Mr. Pollard for having omitted to examine his patient after her delivery; but then, as the evidence showed, this omission is customary. It ought not to be so. Still, we assert that Mr. Pollard is the victim of an unjust sentence. The law has treated him cruelly; and his punishment renders every other man unsafe. This accident requires closer observation than it has received, and we are quite certain that when the matter has been fully investigated, the old propensity, even among accoucheurs, of casting blame upon the practitioner whenever a laceration has been *discovered*, will be proved unjust.

MILITARY HYGIENE IN AMERICA.

The 'American Medical Times' gives a melancholy account of the sanitary condition of the troops in the Northern armies. It says:—"Within the short space of three months it is estimated that 50,000 men were sent to the rear of the 'grand army of the Potomac.'" During this time it was within twelve hours' sail of the capital, commissary stores were in unlimited quantities, and there was no prevailing epidemic which a careful attention to the simplest laws of hygiene would not have prevented. It then attributes this extensive sickness to the mustering of weak and unfit persons, to encamping in unhealthy sites, a disregard of camp police, and improper and badly-cooked food.

CODEIA.

M. Aran has been making experiments with codeia, which he extols above opium, morphia, or any other sedative. He says that it lulls pain without inducing nausea, or constipation, or heavy agitated sleep, or perspiration, or any of the other inconveniences attending ordinary opiates. If this testimony should be confirmed by other observers, we shall have added a valuable agent to our therapeutical resources.

ACCIDENTAL POISONING.

An inquest has been held upon the body of a poor man who resided near Gray's-inn lane, and who died from taking oxalic acid in mistake for Epsom salts. His wife went to a druggist's shop in Leather lane to purchase some salts and senna; but on returning home found that she had, what she believed to be, two packets of Epsom salts. She then went back to change one packet, but, the shop being closed, she returned home, and gave her husband the oxalic acid. The packet containing the oxalic acid was labelled "poison," but the woman was unable to read. The evidence of the poisoning was clear, and the jury censured the druggist for not using sufficient caution in the sale of his drugs.

REVIEW OF THE PERIODICALS.

The 'Medical Record' (Australia), June 26. There is a good article (by the Editor, we presume) in this number, on *Diseases of the Heart.* We quote the following comparative statistics :

"Inflammation of the pericardium is more common in the colony than in England, and the deaths are more numerous. Thus about 1 out of every 359 deaths which ensued in Melbourne during twelve months was from this disease ; while in London it amounted to only 1 out of every 532 of the deaths, and in England to only 1 out of every 889.

"Aneurism, again, is both more frequent and more fatal in the colony than in England. The deaths in Melbourne in twelve months from this disease were 26 out of 3,593 deaths from all causes—about 1 in 138 ; while in London the number was only 68 out of 59,103 of the deaths from all causes—about 1 in 869 ; while in England the deaths were 321 out of 419,865 of the deaths from all causes—about 1 in 1,349.

"The number of deaths registered from diseases of the heart are, however, less in Melbourne than in London and England. Thus in Melbourne 72 deaths ensued in twelve months out of the 3,593 deaths from all causes—about 1 in 50 ; while in London they amounted to 2,092 out of the 59,103 deaths—about 1 in 28 ; and in England to 13,885 out of the 419,815 deaths—about 1 in 30. We are inclined to think, from personal observation, that diseases of the heart are more frequent here than in England. The reason that they do not appear numerous in the Melbourne returns arises from the patients dying of some secondary disease, such as pulmonary congestion, dropsy, or cerebral disease, which have been returned as the cause of death.

"The following table will show the number of deaths from these diseases, all causes, and the population of Melbourne, London, and England :—

	Pericarditis.	Disease of Heart.	Aneurism.	All Causes.	Population.
Melbourne . . .	10	72	26	3,593	139,991
London	111	2,092	68	59,103	2,361,640
England	473	13,885	326	419,815	19,304,887

"With reference to the relative liability of the two sexes—in Melbourne, as in London, males are rather more susceptible than females to pericarditis, but this depends on more males following out of door occupations than females ; thus, out of twenty-seven cases which have fallen under our observations here, having suffered from pericarditis or endocarditis, fifteen of the number were males. The females were either servants or they were compelled to do domestic work, and the males, with the exception of two, followed out-of-door occupations. The two who did not follow out-of-door employment slept or worked in damp rooms.

"Of the 111 deaths registered in London in one year there were 55 males to 46 females ; and of 473 registered in England there were 289 males to 284 females.

"Both sexes here, as in England, are nearly equally susceptible to diseases of the heart. The Registrar-General's returns for Melbourne do not give any information on this subject. Of 2092 deaths registered in one year, in London, 1009 were males, and 1083 females ; and of the 13,885 registered in England, 6779 were males, and 7106 females.

"Males are much more liable than females to aneurism. Of twelve cases which have fallen under our notice in the colony, eleven of the number were males ; the female was a prostitute. She died of congestion of the lungs. There were warty growths on the aortic valves, and an aneurismal pouch of the size of a small walnut, containing layers of fibrine immediately behind these valves. Of the 68 deaths from aneurism registered in London, there were 54 males to 14 females ; and of the 326 registered in England there were 244 males to 82 females. In the colony the aorta, innominata, and the subclavian are the vessels most liable to aneurism, while in England it is the femoral and popliteal.

"Here, as in England, rheumatism and pericarditis are most common in the cold wet months, Of the ten deaths registered in Melbourne last year, six occurred in June and July."

Again, the author says :

"The causes which favour the occurrence of aneurism here, and, as we before observed, the aorta and subclavian are the arteries most commonly affected, is the early appearance of ætheromatous deposit in the coats of these vessels. When this deposit is situated in the aorta, it is not uncommon to find the lining membrane of the left side of the heart more or less opaque and fibrous, and the valves denser than usual. Exposure to cold and wet, habits of intemperance, and rheumatism favour its occurrence early in life here, while severe and long-continued violent exertion with the arms, wheeling a heavy barrow, carrying heavy weights, and falls on the back, or strains, causes the middle and internal coats of the vessel where the deposit exists to rupture, and the external coat to yield from its elasticity, and form a pouch.

"Another circumstance favours the formation of aneurism here, and at an earlier age than in England, and this is the early occurrence of fatty degeneration. It is characterised by a sallow, tallowy aspect of the skin, feeble pulse, and the existence of an arcus senilis, more or less strongly marked. It is very apt to occur in those whose habits are, or have become, sedentary, and who eat and drink rather freely. We are acquainted with a case in which the patient, a gentleman between 50 and 60, presenting this aspect, after rolling off his horse, from the animal putting his foot into a hole, became affected with aneurism of the aorta. He experienced slight pain in the chest at the time. The pain continued, and his breathing became short on exertion, and four or five months after the accident he noticed a pulsatory swelling to the right of the sternum.

"Diseases of the heart occur under the same circumstances here as in England, but the valves of the heart have a much greater tendency to become implicated here in rheumatic pericarditis than in England, for, out of twelve cases which we have had an opportunity of observing, the valves became implicated in eleven of the number. Severe and long-continued exertion, such as wheeling a heavy barrow, or working with a pick when not previously accustomed to it, or after a long rest, colonial fever, great mental anxiety, pulmonary emphysema, albuminuria, and blows on the chest may excite it.

"Inflammation of the pericardium is a much less active disease here than in England, and it is not so liable to prove fatal ; but, from the tendency of the aortic and mitral valves to become affected during its progress and remain, disease of other organs is very liable to appear and induce a fatal result.

"The morbid changes observed in pericarditis differ somewhat from those observed in England, inasmuch that adhesions between the heart and pericardium are somewhat rare. Injection of the pericardium, with effusion of serum, seems to be the most frequent ; deposit of false membranes on the surface of the heart is also common. The latter may vary in extent and in thickness, and is more or less irregular from the rubbing of the pericardium against it. We have several times noticed them in cases in which there was no friction sound during life. The patients in these cases had disease of the valves of some duration. The deposits were dark mahogany coloured, easily stripped from the surface of the heart, and, although irregular on their surfaces, they were smooth and lubricated by serous fluid. The smoothness, and the presence of the serum would account for the non-existence of the friction sound. The disease being less active here than in Europe renders it liable to assume a more insidious course, and if not recognised before the lymph or serum is deposited, especially the former, it may escape the observation of the practitioner. The increased extent of dulness on percussion, compared with that of the heart in health, being the only guide which will enable him to diagnose its existence ; but unless he has examined and determined the size of the organ at the commencement of the rheumatic attack, it is a very uncertain one."

'American Medical Times.' Dr. JACOBI'S Lectures are continued on *Dentition and its Derangements.* He treats especially in this number of the Nervous System. After giving the proportions of the cranium at birth, he remarks :—

"After all, the several parts of the head do not grow at the same rate. The parietal bone has its full circumference at four years, while the frontal bone still continues growing. For this reason, the parietal portion of the large hemispheres of the brain is soon left behind by the anterior frontal lobe. The cranial cavity of the new-born is about a fourth or a third of that of adults, but already in the second year grows from 482 cubic centimetres up to 999, while the weight of the scull at that period reaches already three times its original amount. The occipital portion of the cranial cavity is very small in the newly born, being only 5 per cent. of the whole. The frontal portion is as much as 13.89, the parietal 81.11 per cent. But as early as the second year, both the occipital and the frontal vertebræ grow each by 0.5 per cent. All these facts you will find to be in strict correspondence with the remarks I shall have to make on the relative development of the single portions of the brain.

"The dura mater adheres tightly to the cranium, in infantile age, partly by means of blood-vessels, and partly by conglutination with the sutural cartilages. In the newly born it is loosely attached opposite the parietal tuberosities. It is firmly adjacent to the cerebral surface, strongly injected, bluish, and transparent. With advancing age it gains in solidity, but loses its transparency and injection. The arachnoid membrane and pia mater are very thin, colourless, transparent, and fragile ; they show large veins filled with dark blood ; there is a good deal of cerebro-spinal fluid, but no Pacchionian granulations are observed. The choroid plexus are of a similar nature to that of the meningeal membranes ; they are delicate, and contain more blood. All these facts constitute just as many differences from the condition in which the same parts are found in more advanced childhood, in adults, and in senile age.

"The brain shows a lower degree of development. Its substance

is less white, more transparent, and of a reddish-greyish colour. It is almost of gelatinous consistency, at all events much less solid than in advanced age, and the division into medullary and cortical substance is less distinct. Only some parts excel by their proportionate hardness and their white colour, viz., medulla oblongata, corpora quadrigemina, corp. mamillaria, thalami, and pons Varolii. The fibrous appearance of the large hemispheres is not yet recognisable; the gyrations are thicker, less prominent, and fewer. The lateral ventricles exhibit less serous contents, and their walls are more even. The substance of the brain, finally, contains but little serous blood; only near the borders of the thalami there are a large number of blood specks.

"Not only are these general differences between the brain of the infant and the adult recognisable in every specimen, but there are some which are of quite a specific anthropological importance. The relation of the several parts of the brain to each other changes according to age, as is well proven by accurate measurements, and weighing. The relative weight, for instance, of the large hemispheres, and the occipital portion of the brain, are particularly instructive. According to Hnschke, the cerebellum of the newly born weighs 25 grammes, that of the adult from 180 to 193 grammes; that is, seven or eight times as much as the former. The large hemispheres of the newly born weigh 300 grammes, those of the adult from 1,200 to 1,400, that is, four or five times as much as the former. The per-centage drawn from the foregoing are these:—In the newly-born the cerebellum weighs 6 or 7 per cent., the large hemispheres 94 or 93, of the weight of the entire brain. Already after seven or twelve weeks these figures have been found to vary; the per centage of the cerebellum increasing to 9 or 11 per cent. At ten or fifteen years it has been found to be 12 or 13, nearly as much as in adults, where the percentage of the cerebellum is 12 or 14, of the larger hemispheres 88 or 86.

"A few other percentages are given by Huschke, viz:—Male fœtus of five months, 5·14; female fœtus of seven months, 6·05; of eight months, 7·06; new-born female, 7·32; females of three years, 12·20; male of three years, 11·91; and female of fifteen years, 12·29. The figures of Chaussier differ somewhat: the proportion of cerebellum to the large hemispheres being from 1; 13 to 1; 30, or from 3·28 to 7·7 per cent. The same proportions, with all the astonishing differences, have been found to exist by Gall.

"The forehead of the newly-born infant is narrow and low; the anterior lobes of the large hemispheres must consequently be expected to be proportionately small. Weighing and measuring confirm this conclusion. The anterior lobes in a prematurely born female, yielded only 16·5 per cent. of the weight of the entire large hemispheres; in the new-born, at full term, 22·09; in some who were from eight to twelve weeks old, also but from 16·7 to 18·9 per cent. This figure increases to 22·4 in the first twelvemonth. Whenever a similar figure, for instance 21·8 at seventy-seven years, occurs at advanced ages, circumstances must be peculiarly unfavourable. The remaining, especially the parietal portion of the large hemispheres, must necessarily show the reverse proportion. You remember the figures I gave for the frontal and parietal vertebræ. Now, the anterior lobes of the large hemispheres in the newly-born, weigh from 60 to 70 grammes; in the adult 300—that is five times as much as in the former; the remaining parietal and inter-parietal portion, however, in the newly-born 250, in the adult 1,000 grammes, that is four times as much as in the former."

Dr. Homer O. Hitchcock reports some cases in surgery, from which we extract the following:

CARIES OF OCCIPUT AND TEMPORAL BONES—OPERATION—ENTIRE RECOVERY.

"Case I.—On the 30th of April, 1860, R.M., a man of 60 years of age, but of strong and vigorous constitution, and uniformly good health, came to my office, suffering with very severe pain in the right side of the head, particularly just behind the ear. On examination I found some fulness, redness, and slight tenderness over and behind the mastoid process. The pain was not throbbing, but sharp, lancinating, and paroxysmal. Four or five days before, he had consciously contracted a severe cold, on which this pain supervened. I prescribed for the neuralgia, expressing my fears at the same time that there might follow suppuration, and suggesting, if he should not soon experience relief, that I should see him at his house and apply leeches. I saw no more of him. He had fallen into other hands.

"Eight weeks after, he came again to my office. He appeared much worn out by intense suffering and sleepless nights. For all this time his treatment had been poultices, superficial openings and anodynes, with no benefit, and scarcely a minute's relief from pain.

"He now begged of me to *do something* for him. I reluctantly consented to take the case, insisting, however, upon a consultation as I found on a slight examination a much deeper seated disease than I at first apprehended. The probe could be passed into a circuitous fistula just behind the mastoid, downwards and inwards nearly two inches impinging upon denuded bone. One free straight opening down to the bone was now made, followed by considerable relief to the patient. Within a week, however, the terribly severe neuralgia came on again, with loss of appetite and difficult deglutition. A further and more complete operation was now proposed and accepted. The complexus, the rectus posticus major and the obliquus superior muscles were severed very near their attachments, and a surface of one to one and a half inches in diameter was found carious. By a suitable instrument we endeavoured to scrape off all the diseased surface that could be reached with safety. The disease appeared to extend under and behind the mastoid process, and to have already affected some of the pharyngeal muscles. Just underneath the obliquus superior the disease appeared to have extended entirely through the occiput, and its whole thickness was removed. I feared after all that far under the mastoid process there was some part of the diseased bone unremoved, but on account of the condition of my patient, a further prosecution of the operation was not deemed advisable. The wound was kept well open and thoroughly syringed. The neuralgia was greatly relieved, but my patient suffered severely from a post-pharyngeal abscess. After this had discharged his power of deglutition increased as well as his appetite, and he slowly but constantly improved. The wound was not closed for many months: but has now, two years after the operation, entirely closed, and has been so for a year, and the patient has entirely recovered, except a little stiffness of the neck."

M. Pihan-Dufeillay also contributes some cases to show the relation which exists between *Puerperal Fever and Epidemic Erysipelas*. The cases occurred in the Hospital of St. Louis, Paris. We quote the substance of the article:—

"During the second half of January and the first half of February of this year, puerperal fever raged with an extreme violence in the lying-in wards of the Hospital of St. Louis. This service presents, however, excellent hygienic conditions; repaired a short time ago, it is well aired, having numerous windows to the north, the south, and east, isolated from the other buildings, and composed mostly of separate rooms containing only two beds each; the space reserved to each patient is more than sufficient to prevent any crowding. However, the epidemic made such progress that Dr. Hardy was obliged to interdict the admission of any new women. A good many of those already confined in the ward died, and a few were able to leave after some slight symptoms. In a word, the service was evacuated in a few days, with the exception of six women still suffering from serious puerperal symptoms, and who were placed in the small rooms, while the ward underwent cleaning, and the bedding was partly changed. This took place from the 20th to the 25th of February. The large number of women in labour who daily come to the hospital St. Louis were permitted to close the *service d'accouchements*. M. Hardy had the fortunate idea to give to the lying-in-women one of his rooms usually destined for women affected with diseases of the skin, and situated in a part of the hospital remote from the pavilion of the *maternité*. The latter, having been dried for a few days, thirty-two patients affected with diverse skin disease were transferred in it from the 8th to the 12th of March, and as their removal took place from the Salle Henri IV. to the Salle St. Ferdinand, they were replaced by lying-in women who came from the outside. These filled the thirty-two vacant beds at Henri IV., from the 4th to the 11th of March; and notwithstanding the apparently unfavourable conditions of this new ward, low room, with stone ceiling, dark, badly aired, almost entirely deprived of isolation, the epidemic was cut short in its march. While a few days before almost all the lying-in women were attacked at St. Ferdinand, many died, and those who survived had a long and painful convalescence after labour. The subjects admitted at Henry IV. experienced no accidents of any kind. Their labour was natural; and it was only a month later that, for the first time in that room, two lying-in women died. They had successively occupied the same bed, and both had been submitted, the first in town, before their admission, and the other in the hospital, to painful obstetrical manipulations.

"But at the same time that the sudden and complete cessation of an epidemic extremely intense marked the passage of the women delivered into the Salle Henri IV., the removal into the ward infected by the miasma of puerperal fever of the women affected with diseases of the skin, was becoming the origin of a grave epidemic of erysipelas, which may well be called spontaneous; it attacked indifferently all subjects, whatever their strength, energy, and power of resistance, the previous condition of their health, the nature of the cutaneous disease which had brought them to the hospital, roseola, syphilitic papula, accidental erythema, herpes circinnatus, &c.

"The diseases had not the same gravity in all cases, or at least the erysipelas did not manifest itself in all the patients with the same degree of intensity. As in the most part of epidemics, the first attacked presented the gravest symptoms. We will, therefore, confine ourselves to relate the history of the three first subjects in whom the affection developed itself with an extreme vigour, adding that the other cases of erysipelas we observed, apart from their in-

tensity and duration, presented the same characteristics, the same march of the eruption, and the same symptoms."

We extract from the same Journal the subjoined reports of cases read before the Medical and Surgical Society:

"CEPHALIC VERSION IN BROW PRESENTATION.

"Dr. Elliot, after alluding to the difficulty of cephalic version in cases of brow presentation, related a case which illustrated strikingly to his mind the difficulty of the operation. In this case he replaced the hand and arm, and succeeded with a single blade of the forceps, conjoined with abdominal manipulation, in converting it into a head presentation. On returning to the patient after a few hours absence, it was found that the head had slipped back, and the effort was again made by the vectis to bring down the occiput, but this time without success. Podalic version was then resorted to, the head resisting delivery either by manipulation or forceps; the labour was terminated by perforation, pulsation having ceased in the cord during arrest of the head.

"Dr. Elliot alluded to a second case to which he was called soon after the last, where he found the head and arms in the vagina and the brow presenting. The child was dead. In this case he performed craniotomy, not being able to convert it into a head presentation."

"RUPTURE OF UTERUS.

"Dr. Elliot related a case of labour to which he had been called in consultation. The woman was pregnant with her eighth child. The presentation was normal, and the labour had progressed naturally until six hours previous to Dr. Elliot's arrival, when she complained of acute abdominal pain, and labour pains suddenly and entirely ceased. There was no nausea and no hæmorrhage. The child was dead, and the placenta detached, except at one point. Dr. Elliot delivered the child. No hæmorrhage followed; the uterus contracted well, and no laceration was detectable. Symptoms of peritonitis ensued with coffee-ground vomiting. She died on the third day. No autopsy was obtained. Dr. Elliot was sustained by the members of the society in the opinion that there had been a rupture of the uterus."

"IMPERFORATE ANUS.

"Dr. Post detailed a case of imperforate anus, in which he had been obliged to resort to the operation for making an artificial anus. The anus was perfect for half an inch. There had been vomiting of yellow matter previous to the operation, and the effort was first made to dissect through the septum and reach the distended gut from below. This failing, the descending colon was exposed in the left lumbar region behind the peritoneum. An opening was made into the gut, and the edges of the opening were attached by sutures to the skin. The meconium escaped freely for twenty-four hours after the operation. The following day erysipelas attacked the wound, extending to the genitals, also erysipelas of the face, and the child died."

"ANEURISM OF INTERNAL MAMMARY ARTERY.

"Dr. Clark related the case of a man æt. forty-five who presented himself at the clinique four months since with a tumour in the left breast. The tumour was as large as his fist, hard, having a slight pulsation and a very feeble double murmur at the apex, and synchronous exactly with heart sounds. There was no expansive pulsation, and no pulsation between the tumour and the heart, or between the tumour and the subclavian. There was no fluctuation, but a broad base of dullness extending equally on all sides. It was supposed to be an accumulation of fluid between the pleura and ribs, or between adventitious pleuritic membranes and ribs. At the end of three weeks a conical tumour over the middle of the sternum, the tumour opened and discharged freely. The dulness was considerably diminished, but the pulsation remained, and the murmur continued. Now, after four months, during which pus has been discharged more or less freely, the distinctness of aneurismal disease of the internal mammary artery is clearly marked."

The 'Lancet' opens with a lecture by Dr. T. K. CHAMBERS, on a *Case of Diabetes*. We extract the following remarks on the treatment:

"To accustom this patient to leave off by degrees vegetable aliments, I allowed him first captain's biscuits for a fortnight. During that time scarce any weight was gained, and the urine was but little altered. He liked these biscuits very well. I then ordered him bran biscuits; but he said they were so nasty he could not eat them, and he wasted some of his milk in trying to make them palatable. However, he increased in weight by two pounds during two weeks, and he made eleven pints less urine weekly than on his first admission; and this although he drank as much fluid as he felt disposed to take.

"After this, Mr. Van Abbott was good enough to give him a supply of the gluten bread sold by that firm. For a week he tried hard to eat it in addition to his former allowance of meat; but I am sorry to say he failed in acquiring a taste for it. His appetite fell off during the experiment; he lost half a pound of the weight he had acquired; and was so annoyed at being pressed to eat the gluten bread that he insisted on returning home on July 12th.

"My own feeling is, that we do not act wisely in enforcing a dietary which is really unbearable by the patient in any chronic disease. The great object to be gained is to conciliate the stomach, appetite, and fancy, into taking the greatest possible amount of animal food; and if practically you find that the patient eats more by having a biscuit or a crust, or even vegetables, with his meals, it is better to allow it him than to act the tyrant.

"As to drugs,—opium was given to this patient for a week. It did not seem to exercise any influence at all. However, in some cases it certainly does seem to diminish the excretion of urine, for the amount did not increase again after it was left off. But is that any advantage? or is it only from our education in allopathic prejudices that we reckon on help from such inteference? I confess it seems to me that if the blood gets loaded with sugar, as analysis proves that it does, it is better that it should be washed out by an ample diuresis, then that it should remain at the risk of poisoning the tissues. I have never distinctly traced any harm to opium, truly; but I have traced harm to a drug whose action is similar. Cinchona also diminishes the flow of urine; and I once gave that to a diabetic patient. After a short time he got comatose, and died with effusion in the ventricles. The effused serum was loaded with sugar, which I suppose it was the business of diuresis to have washed away.

"For this reason I avoid cinchona in diabetes, even when I desire to give tonics for the sake of increasing appetite. I prefer iron and strychnine. An elderly patient of mine, with moderate diabetes, is now taking those drugs with advantage to his strength and digestion, and without any deleterious action on the kidneys.

"The iodide of potassium which you see prescribed on his medicine-card was given on purely empirical grounds. There are no drugs known to do good to the essential phenomena of diabetes; there were no secondary symptoms demanding special medication, so I thought it a fair case for an experiment. The result was, that at all events no harm was done; the patient continued to increase in weight and strength, and did not exhibit any of the usual symptoms of intoxication by iodine.

"This is not like substituting an experiment in search of a possible specific in place of rational treatment; such conduct is, indeed, most reprehensible. But here there is no medicine omitted, for there is none to be given that offers any hope of its possessing an alterative agency, and it is a question between either something new or a mere placebo. I shall try the iodide of potassium again on the next similarly pure and uncomplicated case."

MR. HENRY HANCOCK continues his observations on *Division of the Ciliary Muscle*, in which he gives some interesting examples of the operation. The following case of *Malignant Pustule* is reported by DR. ROBERT HARPER, of Holbeach:

"On the 5th of September, 1860, at two a.m., I was requested to visit J. G——, aged thirty-six, a farm labourer, residing seven miles off. The case was represented to be a very serious one, and I therefore went at once. I found the patient in the following state:—The penis of an enormous size, hard, and of a livid purplish colour; hardness to a less extent over the pubes, and tenderness over the same region and extending upwards towards the umbilicus; scrotom not inflamed. At first sight, it looked like a case of extravasation of urine; but the history of the case at once set this matter at rest. It appeared that he had been employed for two days in dressing diseased sheep; that during the operation he had occasion once or twice to pass urine, and thus touched his penis without washing his hands. About eighteen hours previous to my visit he first noticed an extreme itching at the end of his penis, soon followed by pain, and which induced him to look at the part; when he 'found a pimple on the foreskin, with the head gone, and a slight watery discharge proceeding from it.' There was also hardness and redness at the base; inflammation quickly spread upwards; and, the patient becoming very ill, I was sent for. There was great constitutional disturbance, evidenced by confused intellect, a loaded tongue, excessive thirst, hot dry skin, full, quick, bounding pulse, etc. The patient was a steady temperate man, much respected by his master, with whom he had lived for fifteen years.

"I made an incision from the pubes along the dorsum of the penis to the prepuce; ordered twelve leeches to the abdomen between the pubes and umbilicus, hot fomentations and poultices, calomel purgative, etc.

"It would take up too much space to enter into the daily state of the patient. Suffice it to say, I very soon adopted the supporting and stimulating plan of treatment; stale beer ground poultices, etc. The skin of the penis died and came off like the finger of a glove; extensive suppuration took place above the pubes. The patient was very ill for several weeks, but ultimately recovered.

"I have sent the case of J. G—— for publication in consequence of reading the very interesting paper of Dr. W. Budd in 'The Lancet,' and thus to assist in corroborating his statement, that the

disease is not of such rare occurrence in England as the silence of medical and surgical authors on the subject would lead many to suppose. Two other cases have come under my own notice, both fatal. One was under the care of Mr. South, in St. Thomas's Hospital, when I was a dresser under him, eighteen years ago. Mr. South at once pronounced it to be a case of malignant pustule; and his prognosis that the patient would be dead in three or four days, was equally correct.

"It is true that the case of J. G—— differs in some respects from the general history of such cases. In the first place, the disease was situated on a part not exposed to the air like the face, hands, etc.; but the manner in which the poison was conveyed to the part is very evident. And secondly, the gangrenous inflammation set in more rapidly, but did not go on to a fatal issue; the patient, however, was so ill, and the history of the case so clearly pointed to malignant pustule, that I at once informed the friends of the usually fatal character of the disease, and was much surprised at the favourable termination.

"It is worthy of observation that J. G——'s master attended to him and poulticed him at first, but at the end of five days was seized with extensive suppurative inflammation of the hand and arm (as far as the axilla), and was very ill for several weeks, but also ultimately recovered. There was no discoverable lesion to give rise to the inflammation."

The 'Medical Times and Gazette.' Dr. Ramskill on *Epilepsy* opens this number. We extract the following two cases:—

"I. D. (vol. E. p. 57), aged thirteen, has had epilepsy eighteen months. Had no fits in infancy, no nervous affection up to the period of present illness. Family history good. First attack occurred after eating some crab-fish for supper. It was long and violent. The second occurred after two months' interval; cause of this not known. The third occurred in fourteen days, and they have recurred at varying intervals—from one week to three weeks. They always occur during the night. He screams sometimes, and not unfrequently bites his tongue. Latterly his mother has noticed that some days he rubs his left cheek, complaining of face-ache, after which the fit follows. He is a healthy-looking boy; tolerably well-fleshed, although the muscles feel somewhat flabby. He is intelligent, and does not appear to have suffered in apprehension or memory; no headache nor vertigo. Organic functions tolerably well performed; no inter-paroxysmal phenomena. On examining the mouth, there is to be seen a molar tooth considerably decayed, with a swollen gum around it, and partly growing over into the cavity; it is not very tender to touch, and the examination does not give rise to toothache. On questioning, I find the sensation which the boy experiences before a fit does not seem to be one of pain, but rather of an indefinite uneasiness. He always has a fit the night on which this uneasiness comes on. Has never felt it during the day; it is always about seven to eight o'clock. I desired the mother to have the tooth extracted, and ordered a simple saline with a quarter of a grain of belladonna, to be taken twice daily. This was in June. The tooth was extracted next day. I saw this boy once a fortnight from that time for four months, but he has had no recurrence of the fit.

"In this case I believe an unfelt aura commenced about the gum surrounding the tooth, and was not recognised till some degree of inflammation arose, and thus a modification of pain became associated with the aura, and directed attention to it. I have at the present moment another and very similar case to this. The extraction of the tooth has not yet been performed, so that I cannot give you the result. When epilepsy occurs in children, I always examine the mouth with the twofold view of observing the vault as to height, narrowness, &c., inasmuch as no observation about the cranial development can be complete without such examination, and of ascertaining whether any cause of eccentric irritation may spring from decayed or crowded teeth. I would observe here that, later, the *dentes sapientiæ* often become a source of considerable irritation, and, therefore, of complication at least in the epilepsy of young persons.

"I would now direct your attention to very bad cases of epilepsy, and in illustration give you a short history of unfortunately a very unsuccessful one:—J. T. (vol. E. p. 129), aged twenty-eight, married eight years, has three healthy children, and the last had convulsions from soon after its birth to the time of its death, which occurred when nine months old: family history otherwise good. Does not know that he had fits as a child nor chorea. Was healthy until the occurrence of epilepsy. Attributes it to a fright he received when travelling in Spain. The party, of which he formed one, was attacked by robbers. Had a fit at the time. They recurred at varying intervals until a few months ago; since then they have come on regularly twice weekly, always at night, and in batches of three or four fits. He does not scream, neither does he bite his tongue; he is generally and equally convulsed, and his wife fears he will sometimes die, because he holds his breath so long. Sexual indulgence is almost always followed by a fit. The fits come on regularly on Tuesdays and Thursdays. Has not the least warning of an approaching attack. Has great wearing pain in the back for some days after each illness. No interparoxysmal phenomena beyond occasional involuntary starting; then small clonic convulsions occur in various parts of the body. Memory very bad; power of attention very feeble; apprehension slow. He is tall, very thin, of worn, languid aspect; slow in speech and motion. He has the appearance of suffering from the effects of great sensual indulgence, and confesses that this supposition is true. He was at first treated with quinine and belladonna without success, then by mineral acids, chlorie ether, and cod-liver oil, afterwards with belladonna in increasing doses nightly, also by the actual cautery to the spine, still without avail. I galvanised this patient all over the body with a view of discovering an aura, without succeeding. Lastly, I directed his wife to apply a ligature around the left arm, directing its position to just below the insertion of the biceps. The ligature was to be applied on the Friday following, to be pulled tight on getting into bed, and relaxed for a few minutes every half-hour. The fits came on as usual two hours after applying the ligature, and at a time when it was tight, and the arm swollen from the pressure. On the following Tuesday the same process was applied to the right arm, afterwards to the left thigh, and finally to the right thigh. On this night no fits occurred. For five weeks fits were averted, when without any sort of warning, a violent one came on during the day; it was followed by delirium, extending over two days, terminating in arachnitis and death. I failed to procure a post-mortem, otherwise I should give you the details of the terminal illness.

"The point to which I wish to attract your attention is this: That an aura may exist in every case. I believe it does exist, not necessarily associated with sensation or irregular motion, and yet discoverable, if it exist in the extremities. The means whereby you may discover it are those mentioned in this case. To find an aura in any one of the extremities is a matter to me of great rejoicing, since the discovery doubles the chances of curing the patient.

"Amongst the patients who have attended, or who are attending as out-patients here, many of whom are cured, I find the following who had these premonitory symptoms of a fit:—(Vol. E. P. p. 57) sensation of a peculiar kind, indescribable, in both hands; twitching in legs (p. 89); pain in pudenda (p. 100); jerking of left arm (p. 116); shaking and temporary palsy of fingers (p. 188); squint for two days (p. 196); trembling and paralysis of left leg and hand (p. 234); shaking and tonic contraction of both hands (p. 248); only trembling of both hands, especially of fingers (p. 256); strong contraction of fingers of right hand (p. 282); strong contraction of right thumb (N. p. 16.)

"Vol. E. Extreme coldness of all fingers (p. 8); coldness of fingers and cold perspiration (p. 11); pain at the back of the neck (p. 12); itching at the anus (p. 16); pricking in right hand (p. 126); pain on micturition (p. 134); cramp of arm and forearm (p. 163); pain at the seat of a blow or fall on the side of the head (pp. 193, 200, 270)."

Dr. Julius Althaus contributes an article on the *Therapeutical Use of Electricity and Galvanism.* Dr. Henry Dick a paper on the *Operation for Phimosis*, which we reproduce:

"In the year 1855 I published in the 'Medical Times and Gazette' (No. 284) an article 'On Operation for Phimosis,' and drew the following conclusions, viz.:—

"1. That congenital phimosis consists in contraction of the orifice of the prepuce (integument and mucous membrane) and of its mucous lining.

"2. That for the removal of phimosis, incision of the orifice and subcutaneous incision of the mucous membrane are quite sufficient.

"3. That this operation involves no mutilation.

"I still adhere to these conclusions, even more strongly than when I wrote the article alluded to, because since then I have performed the operation eight times, and each time with the most complete success.

"My last operation was upon the child of a Medical man, and I performed it in the presence of my friend Mr. William Adams and Mr. Baillie, of the Bengal Medical Staff, and they can testify not only to the simplicity of the operation, but to its full success.

"I still adhere to the same rules in operating which I stated in 1855, but only in the adult, because in children the knife cannot be easily managed: in such cases I prefer to use scissors in cutting the orifice and the contracted mucous membrane. The orifice in children is generally so much contracted, that it is with the greatest difficulty a very small grooved conductor can be introduced under the prepuce, and on this conductor I divide the orifice of the prepuce.

"After dividing the orifice the operator will find it more convenient to lay aside the conductor, and whilst the assistant is drawing back the prepuce, the operator should cut with the scissors the contracted mucous membrane. One blade of the scissors should be rounded in order to avoid wounding the glans penis.

"In the adult I still adhere to the same rules which I mentioned in 1855. There is hardly any bleeding worth speaking of.

"In some rare cases the frenum must be cut, because it seems too short; but from this rule I have begun to depart occasionally, because in the case of the Medical man's child I wanted to cut the frenum, but the father was opposed to my doing so, as he feared the effect of loss of blood from the small arteries of the frenum, the child not being very strong. After some weeks the frenum spontaneously yielded by the prepuce being drawn back several times a-day.

"In order to ensure success, after the operation is performed the prepuce should be drawn back, and some oil applied to the divided mucous membrane. I do not use any other dressing, neither is any bandaging required. After eight or ten days all is well, and not the least multilation can be observed.

"In justice to Mr. Skey, I must state, that in his work on Operative Surgery he admits that the simple incision of the mucous membrane is sometimes sufficient.

"Congenital phimosis is a deformity arising from the mucous membrane being too short, and sometimes from the frenum not being sufficiently long. Circumcision, or any modified operation of circumcision, whatever name it may bear in works of Surgery, is wanton. Cutting away the prepuce, or a ring of the prepuce, stitching together the cut skin and mucous membrane, are irrational operations, and are just as absurd as is amputation of the limb for the cure of club-foot, as the old Surgeons used formerly to advise.

"In conclusion, I would state that enuresis nocturna and other symptoms of irritation of the urino-genital organs in children have very often their origin in phimosis. In children phimosis is not so easily detected as in adults. In two of my cases in children, enuresis and irritation of the bladder completely ceased after the removal of the phimosis.

"I must add, that after the operation the prepuce should be drawn back very frequently during the first six months, to prevent recontraction, which otherwise would be likely to ensue. I have found this precaution very necessary to be taken in the cases of children, in whom this tendency of the mucous membrane to recontract is stronger than in adults. As the operation, when performed in the manner I have now and previously (1855) described, is attended with so little pain, it is not at all necessary to administer chloroform."

On the Action of Certain Substances upon Phthisis. Dr. PAYNE COTTON gives his experience of the use of quinine. He says:

"With the view of testing, so far as practicable, the general therapeutical value of quinine in the treatment of consumption, I prescribed it for twenty-five patients, in various stages of that disease; avoiding, as in all my previous experiments, any selection of cases, and excluding only those unfitted by the existence either of acute symptoms or special complications. The dose consisted, according to circumstances, of one or two grains two or three times a-day; and was continued for periods varying three to ten weeks. Notes were regularly taken by Dr. Harington, resident clinical assistant.

"Ten of the patients were in the first, six in the second, and nine in the third stage of phthisis. Sixteen were males, and nine females. Their ages varied from twenty to fifty years.

"During the administration of the quinine seven improved *greatly*, five improved *slightly*, and thirteen either did not improve at all or became worse. Of the twelve improved cases, seven were in the first stage, two in the second, and three in the third stage; and, of the thirteen cases in which the quinine seemed to be inoperative, three were in the first stage, and ten were the subjects of more or less advanced tubercular softening. Thus it would appear that whatever good may have resulted from the quinine, it was the most decided in the early stage of the disease.

"In fourteen of the cases cod-liver oil was taken during at least a portion of the time. There was an increase of weight in ten out of the twenty-five patients; such increase occurring in five who had taken the oil, and in five who had not taken it, but being most marked in the former.

"In four cases the quinine appeared to disagree, producing dyspepsia and loss of appetite. In six instances patients who had made little, if any, progress under the quinine by itself, were more or less benefited when steel was added to it. Two of these cases were remarkably good illustrations of the combined influence of quinine and iron; one was in an early and the other in an advanced condition of disease, but both left the Hospital with every local and general sympton in abeyance, and their health fairly good, after taking for several weeks two grains of quinine twice a-day, and a tablespoonful of steel wine immediately after dinner.

"From these facts, compared with previous observations on other remedies, the following are the conclusions at which I have arrived:—

"1. That although quinine may be well adapted to certain cases in which there is an evident cachexia, it is greatly inferior, as a general remedy in phthisis, to some other tonics, whilst in a few instances it is unsuited to the disease.

"2. That the combination of quinine and iron is sometimes very beneficial."

GENERAL CORRESPONDENCE.

PETRIFIED HUMAN SKULL.

To the Editor of the Medical Circular.

This globular-shaped skull was found in Rosswell Hill,* in the Isle of Ely, Cambridgeshire, during the removal of the rising ground to fill a railway embankment. It has all the characteristics of a human skull which has undergone petrifaction through the interchange or infiltration of flint layers, which has left beautiful crystals during the conformation in many parts—viz., eye-sockets, nasal openings, temporal regions, and on the hard palate arch.

Its weight is 13½ lbs.

Circumference, 21½ inches.

Transverse diameter, from each auriculur opening, 14½ inches.

Antro-posterior, from root of nose to spine of occiput, 12 inches.

While taking these measurements, a lady from Leipzic happened to be present, and she, having a truly Saxon skull, I asked permission to measure it. The proportions are as follows:—

Circumference, 20½.

Diameter, 13 inches.

From individuality to philoprogenitiveness, 12½ inches.

The approach in size bears a close proximity. Both are of the square-headed type.

This fossil human skull has been more or less altered in shape during the change, owing to the pressure of some incumbent earth coming on the right side of the head, and thereby flattening the occipital region on the left side, and causing a complete obliteration of the articulating fossa on the right side, and deepening the temporal region on the left. The groove over the left orbit is perfect for the frontal nerve; also the opening of the nasal duct, which is decorated with flint crystals, which have permeated the ethmoid bone. The alveolar outline is well marked, and the arch is unmistakeably defined, leaving on the anatomical mind, after this detailed examination, no doubt as to its identity with that of a true human skull.

Man has recently been found among the mammoths, also flint stones, supposed to have been fashioned by human hands. Who will now venture to place an age on this skull? How many thousand years did it take to produce this change?

(Signed) R. TUTHILL MASSY, M.D.

P. S.—The hydrocephalic appearance of the frontal and parietal bones is due to the pressure above referred to.

A question arises in the mind when comparing this fossil with the myriads of the Isle of Portland, is the brain formation within perfect as we find the fish formation perfect when the shell is broken in these innumerables of which the Weymouth breakwater is formed, and built up of those now cast forth from the prison island?

The above was written in June, after the discovery of the cranium, which has since passed through many learned hands, some doubting the possibility of such a thing as a fossil human head. The lapidary has at last passed his saw through 30 inches of the fossil, making an antro-posterior section, which has placed all further argument out of the question, for here I find the distinct bony outline and arch of the skull defined by an infiltration of silicious earth, also the *falx cerebri*, or that portion of the *dura mater* which separates both lobes of the brain, and beneath this fibrous membrane the *brain-like appearance was visible*, and also that part which occupies the section and spongy tables of bone within the nose.

Surbiton, Surrey, August 26, 1862. R. T. M.

LEGAL INTELLIGENCE.

NISI PRIUS COURT, LIVERPOOL.—(Before Mr. Mellish, Q.C.)

RICHARDSON ET UXOR *v.* POLLARD.

Mr. Pope appeared for the plaintiffs; Mr. Overend, Q.C., and Mr. Gully for the defendant. This was an action brought by the plaintiffs to recover damages from the defendant, who is a Surgeon at Chorley, for unskilful and improper Medical treatment of Mrs. Richardson, the female plaintiff. The husband was a booking clerk of the Lancashire and Yorkshire Railway at Blackburn. The wife carried on the business of a milliner in the same town. On the 9th of April, 1861, defendant was called in to attend Mrs. Richardson in her first confinement, she then being thirty-one years of age. In attempting to assist the delivery he employed manual force, and it was in doing this that the alleged want of skill had been manifested. The result of the violence used was shocking in the extreme. The perineum and the adjacent muscles were ruptured, and a wound caused which extended to and through

* L. Banett, Esq., of Cambridge, has kindly forwarded to me a geological section of Rosswell Pit, near Ely, which has five distinct geological formations:—1. Lower chalk. 2. Gravel. 3. Boulder clay. 4. Lower green sand. 5. Kimmeridge clay.

the rectum. The child was born half an hour afterwards. The consequences of the wound were dreadful, and the poor woman suffered the most excruciating pain. The defendant said she would soon get better, and it was not until the end of the twelfth week, when she could no longer bear her agony, that he examined her. Mr. Morley, Surgeon, was called in, and found that she was suffering from ulceration and an abscess, and that if proper means were not at once taken, Mrs. Richardson would all her life be subject to pain and unnatural inconvenience. A sister of the female plaintiff and several other female witnesses testified to the ulceration and violence that was used. Three Surgeons were called to speak to the proper mode of treatment under the circumstances. They deprecated the use of manual force in the way described. For the defence Mr. Overend called Mr. Pollard. He stated that he had been in practice at Chorley forty years, and positively denied the use of the violence ascribed to him. He was not aware after the birth that there had been any rupture of the perineum, nor did the woman inform him of the injury until after he had ceased to visit her for three weeks, and he was then called in to attend her for a gathered breast, when she told him of the unnatural state she had been in from the first. He said that the female plaintiff and the other female witnesses had been guilty of falsehood. Dr. E. G. Craik, M.D. of the University of Edinburgh, and Licentiate in Midwifery of the Royal College of Surgeons, and Dr. W. Pilkington, a Physician residing at Chorley, testified that no want of skill was manifested by an Accoucheur in not being aware of such a rupture, the former gentleman saying, however, that the symptoms and inconvenience experienced by Mrs. Richardson denoted that the passages had been torn into one throughout. Mr. Overend having summed up his evidence, and Mr. Pope replied, his Lordship summed up the case to the jury, telling them that a professional man like a Surgeon was bound to bring to the performance of his duties a reasonable amount of care and skill; at the same time cautioning them against a verdict involving such serious consequences to the defendant, without the fact of his having committed gross negligence being brought home to their minds beyond all reasonable doubt. The jury found a verdict for the plaintiff—Damages, 120*l*.

Births, Marriages, and Deaths.

BIRTHS.

HUBBARD.—On the 12th ult., the wife of Henry Hubbard, L.R.C.P. Lond., of St. Peter's Lodge, Kensington park, of a son.

KEBBELL.—On the 22nd ult., at Upper Brunswick place, Brighton, the wife of William Kebbell, M.D., of a daughter.

LAVIES.—On the 23rd ult., at Warwick square, Belgrave road, the wife of J. S. Lavies, M.D., of a son.

WALKER.—On the 24th ult., at Blakesley house, Towcester, Northamptonshire, the wife of T. Osborne Walker, Esq., M.R.C.S., of a daughter.

MARRIAGES.

BENTLEY—BOURNE.—On the 21st ult., at St. Matthew's, Bayswater, William T. C. De Bentley, M.D., to Matilda, second daughter of Timothy Bourne, Esq., of Claughton, Birkenhead.

DEATHS.

ARBUCKLE.—On the 24th ult., at Auchenhay, Kirkcudbrightshire, Robt. Arbuckle, M.D., of Auchenhay.

ARROTT.—On the 21st ult., at Almericelose, Arbroath, William Arrott, M.D., aged 89.

FOOTE.—On the 18th ult., at Gnadau, Prussia, W. Vivian Foote, Esq., second surviving son of the late W. H. Foote, M.D.

SHAW.—On the 20th ult., at Hampstead, William, eldest son of William Shaw, Esq., M.R.C.S., aged 19.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on the 21st inst.:—William Henry Cocker, Blackpool, Lancashire; Edward Cookson, Notting hill Dispensary; John Ellerton, Wakefield, Yorkshire; Robert Fouracre, Perriman, Plymouth, Devon; John Harvey, St. Mary's Hospital; Frederic Blakesly Mallet, Bolton-le-Moors; Arthur Trehern Norton, St. Mary's Hospital; Maurice Jas. O'Connor, Morpeth Northumberland.—The following gentlemen also on the same day passed their first examination:—John David Frankish, Guy's Hospital; Thomas Edward Mason, Guy's Hospital.

THE PROPOSED LUNATIC ASYLUM FOR CAERMARTHEN, CARDIGAN, AND PEMBROKE.—The plans for this asylum, though approved by the Secretary of State, have not been proceeded with on the score of expense.

INSANE INMATES OF WORKHOUSES.—During the year 1861 there were reported in the several workhouses throughout England and Wales 6071 insane, idiotic, and imbecile inmates. As returns were not given from two or three places, the entire number may be stated to be about 6100.

THE DANGERS OF ACROBATISM.—Miss Selina Young,—known as the female Blondin,—aged thirty-two, was admitted into St. Bartholomew's Hospital (Queen ward), under the care of Mr. Lawrence, on the 15th instant, having sustained severe injuries the day before at Highbury Barn, by falling from a tight rope. She was much bruised about the body, especially on the left side, and had sustained a fracture of the neck of the left thigh bone *within* the capsule. There was much swelling and bruising about the right shoulder and scapular region; but she was too sore to permit of a minute examination at this part. Crepitation was heard in the scapular region, between the scapula and the chest, and a fracture, either partial or complete, was suspected to have occurred in that situation, especially as she felt sharp pain on deep inspiration. The fractured limb was properly put up in a long splint, and for some days it was necessary to support the patient's strength with brandy and other stimulants. On the 26th inst. she was much better in every respect, and expressed herself as feeling tolerably well. Much of the bruising and swelling had already disappeared, and she could throw out and move the right arm and shoulder with perfect freedom and without pain. She has now no pain anywhere, and is expected to make a good recovery. The fractured limb is extended to nearly the same length as the opposite one; she has borne extension pretty well; and it is anticipated that in all probability there will be but very little shortening ultimately. The patient stated that she was suddenly seized with cramp in the fingers, which compelled her to let go the pole previous to her fall. Under the assiduous attention of Mr. Butler (Mr. Lawrence's house surgeon), and Mr. Battye (the patient's dresser), she has progressed most favourably. No internal injury of any kind was sustained. The chief force of the fall seems to have been spent upon the left side of the body, more particularly over the hip and thigh. She is apparently a stout, well-built person, of short stature, but with powerful limbs. Mme. Jas. Potter, the daring wire-walker, who, by a singular coincidence, was precipitated to the ground at the Hipprodrome on the same day that her intimate friend the "female Blondin" met with her terrible accident at Highbury Barn, is, we are happy to learn, progressing favourably towards convalescence.—'Lancet.'

PROFESSIONAL ADVANTAGES OF THE EDINBURGH SYSTEM.—To complete the arguments in favour of our medical curriculum as it stands in relation to arts, I ought to show how seriously the development of the Medical Profession itself has been hindered by a too exclusive devotion of the medical student to the dead languages, and how great services have been rendered by this University in adopting a more practical course. In England the too learned physician became a specialist, and Medicine and Medical Practitioners were in consequence so divided in study, practice, and organisation, that the natural unity of the Profession was destroyed, and the conflicting grades of practitioners set up. But in Edinburgh this natural unity was, and is, maintained; and you, gentlemen, will pass into the world equal in academic rank, but free to study and practise in whatever department of Medical art your natural tastes and talents may lead you to adopt. It is highly gratifying to observe how much progress this principle has made in England of late years, and that it is becoming more and more clear what evils the contrary principle has inflicted on the profession. We will not draw upon history for illustrations of those evils; rather let us hope that a new era is dawning upon us. The College of Physicians of London, with most praiseworthy zeal, is about to abandon that unhappy principle which excluded surgery from the studies and practice of physicians, while, simultaneously, an academical position has been given to surgical science in the English universities. These two changes foreshadow, I confidently think a corresponding change in medical organisation. One step alone is needed. When, by combination, the medical and surgical colleges have carried out the principle of the natural unity of the profession, the organisation of the profession will be in harmony with the medical faculties of all the universities, and in England, as here, the motto will be—*E pluribus una*.—Dr. Laycock.

MEDICINE IN RELATION TO THE OTHER FACULTIES.—I have left myself little time for any remarks on the academic position of medicine in relation to the other faculties and professions; but this is the less to be regretted, because public opinion is more and more declaring itself in favour of the study of physiology, or rather biology, as a branch of general education, That which is taught in our ragged schools must sooner or later find its way into our universities. The repression of crime and the advancement of morals will be all the more effective, in proportion as our magistrates, judges, lawyers, and divines become acquainted with the subtle and never-ceasing action of the corporeal on the spiritual part of human nature. If not so ornamental, far more useful will such knowledge be than the most intimate acquaintance with Homer or Plato. Two professions not hitherto developed by academic training will ere long be brought within the sphere of university discipline. The military and naval officer and the schoolmaster are daily becoming of greater importance as science perfects alike

the arts of war and of peace. Each has to educate, discipline, develop the mental powers; each has to govern and train. To both a knowledge of the physiological side of human nature, and of all that constitutes and maintains the *mens sana in copore sano* is essential for success. Now, this knowledge medicine, in its wider applications to psychology and hygiene, can alone supply. Efforts have been made already to bring the military profession within our national republic of letters, and the scholastic profession is already so connected with the universities of this country that the more complete academic training of the Scottish schoolmaster can only be considered a matter of time and detail. At present the great question of religious teaching stops the way—each religious sect, with few exceptions, claiming to educate its own children in its own dogmas and ceremonies. This is the natural result of earnestness in religion; what a man believes to be true he would have his children and neighbours to believe with him. The fact is overlooked that if each succeeding generation had held to the faith of its fathers there would have been no sects, nor even Christians—a sufficient proof that, however natural the desire to perpetuate beliefs may be, it never can be accomplished. While, therefore, we naturally teach our children what we believe to be the truth, we should remember not only that we may be wrong on some points of faith, but that we most certainly are wrong; and out of this humble but too true estimate of ourselves will arise the conviction that we have a higher duty than that of teaching what we believe to be true—namely, to imbue the rising intellect with an abiding love of truth, and so to train the faculties that it may be as able, as it is willing to discover truth. This is incompatible, however, with a sedulous pre-occupation of the mind by opinions and beliefs. 'I know, indeed, no better inheritance for a man, or a surer help to advancement and happiness, than the love of truth and the capacity to seek after it. It is available alike for scientific progress, for material advantages, and for happiness in the highest and best sense. On the contrary, the mind which is loaded from youth upwards with prejudices, lags miserably behind the age and time, and grows up stunted and deformed. Free exercise of the mental faculties is as necessary to mental power and symmetry, as freedom of the limbs to corporeal beauty. This truth all mental science teaches, and some of you cannot but know the reason why. —Dr. Laycock.

Quarantine in the Thames.—At this moment an iron crew steamer lies in the Victoria docks at Blackwall, on board which certainly eight people, if not nine, have very recently died, in a manner which has been sought to be concealed or mystified. The vessel, the *Melita*, of 800 tons, belongs to Messrs. Begbie and Campbell, of Mansion-house-place. She has arrived in the Thames under circumstances so calculated at first to inspire alarm that they have been brought prominently and specially under the notice of the Commissioners of Customs. She left Nassau, New Providence, so recently as August 2, having previously, it is said, run the blockade at Charleston. She had on board a crew of some fifty officers and men and twenty-three passengers, with a general cargo, including about twenty-five bales of cotton. On the voyage home, which lasted barely twenty days, no fewer than seven of the passengers and the engineer of the vessel died of yellow fever, it is reported and were buried at sea. The captain and two of the passengers landed at Dover, leaving the ship in charge of the chief mate and a pilot, She then steamed up the Thames evaded the quarantine regulations at Gravesend, and arrived in the Victoria docks on the morning of Wednesday or Thursday last. There she was boarded and overhauled in the usual manner by Mr. Richards, an examining officer of Customs, who in the course of his search, heard from some of the crew in an incidental way what had happened on the voyage, and which he deemed it his duty to report immediately to head-quarters. He and two or three of his assistants, with a pilot named Brooks and some other people who had gone on board, apprehending nothing wrong, were condemned to remain there as were also all the surviving passengers and crew, during three or four days and nights. The vessel was pushed off into the basin, detached from the quay and away from the rest of the ships, while a vigilant guard was kept over her lest any one on board should escape, and, what was much less likely, lest any one should approach her.

The Bite of a Rattlesnake.—Mr. George W. Kendall writes the following, from Texas, to a newspaper in New Orleans:—"Before I forget I must tell you that the medicine chest has just arrived, and the very moment I opened it I found a pressing use for one of the articles it contained. I was counting over the flasks, when one of my men came running in, and exclaimed that he had just been bitten by a rattlesnake. He held his left wrist, while two streams of blood flowed from one of his fingers, where the fangs of the serpent had pierced him. As the man had no tobacco, I told him to fill his mouth with salt, and with all his might suck the wound. I then held a cloth steeped in hartshorn on the wound, to counteract the working of the poison. I next put thirty drops of hartshorn into a glassful of whisky, and poured the whole contents down his throat. Five minutes afterwards I repeated the dose, and again in other five minutes. I had now administered a whole quart (?) of whisky, with ninety drops of hartshorn, and held it sufficient. The man was an Irishman, an old soldier, and took the thing very coolly. It was a great satisfaction to him when he heard that another man had killed the serpent. For three-quarters of an hour he sat quiet, and spoke about the bite with cold-blooded indifference, while I continued to renew the application of hartshorn to the wound in the finger. He said it was too bad that he should die of the bite of a poisonous snake, while I was astonished he could remain unaffected after such a dose of whisky. After about an hour he began to laugh, then to whistle, then to sing, and finally attempted to dance. It was now all right. I knew that the whisky had gained the upper hand of the poison, and for the first time intoxicated him. Five minutes after he was as drunk as Bacchus, beat on the ground with his feet, slept for half a day, and in the morning was well and at his work. So much for the first case which I have cured with the contents of the medicine chest! The hartshorn, with the whisky, completed the cure."

Action for Libel.—An Australian letters says:—A fertile subject of conversation here, has been an action for libel brought against the 'Argus' by Dr. Bowie, the surgeon-superintendent of the Yarra Bend Lunatic Asylum. The defendants to a certain extent succeeded in proving that considerable amount of wrongdoing had been practised, and the jury returned a verdict substantially for the 'Argus,' but on one count for the plaintiff, with damages 100*l*.

Domestic Employment of Castor Oil in China.—In China, castor oil is constantly employed for the ordinary purpose of life, as we should use olive oil or butter, its evacuant action having become subtended by force of habit. The Chinese, however, sometimes forget that Europeans do not enjoy this immunity, and M. Stanislaus Martin relates that several years ago some French envoys believed themselves to have been poisoned by the mandarins, who had invited them to dinner. All the dishes had been prepared with the oil of *palma christi*, which induced a terrible purgation; but happily the discovery was made before reprisals, for what appeared to have been traitorous conduct, were taken.

Appointments.—Arthur Wellesley Waterloo Babington, M.R.C.S. Eng., L.A.H. Dub., has been appointed Surgeon Superintendent to the *York* convict ship.—John Berland, M.D. Univ. Glasg., has been re-elected Parochial Medical Officer, Kilmarnock, Ayrshire.—Horatio Coare Brenchley, M.R.C.S. Eng., L.S.A. Lond., has been elected one of the Medical Officers of the new Camberwell Provident Dispensary.—John Bringloe, M.R.C.S. Eng., and L.M. L.S.A. Lond., has been elected one of the Medical Officers of the new Camberwell Provident Dispensary.—William Bruce, M.D. Univ. King's Coll. Aberd., L.R.C.S. Edin., has been elected Secretary for 1862-3 of the Buchan Medical Society.—J. Magor Cardell, F.R.C.S. (exam.) Surgeon to the Salisbury Infirmary, has been appointed Deputy-Coroner for the Southern District of Wiltshire.—John Tasker Evans, M.D. Univ. St. And., M.R.C.S. Eng., L.S.A. Lond., has been appointed Surgeon to Christ's Hospital, Hertford *vice* Richard David Jones Evans, M.D. Mar. Coll. Univ. Aberd., F.R.C.S. Eng. (Hon.) L.S.A. Lond., deceased.—Augustus Eves, M.D. F.R.C.S., Consulting-Surgeon to the Cheltenham General Hospital, has been elected President of the Gloucestershire Medical and Surgical Association.—Dr. Glen, Civil Surgeon, Broach, Bombay Presidency, has been appointed one of the Municipal Commissioners for the town of Broach.—Albert Gunther Dip. in Med. and Surg. Stuttgart, Assistant (1st class) Zoological Department, British Museum, has been elected Fellow of the Zoological Society of London.—James Hurd, M.D., has been appointed Certifying Surgeon under the Factory Act for the Frome District, *vice* B. Mallam, resigned.—Andrew Jackson, L.F.P.S. Glasg., has been elected Medical Officer and Public Vaccinator for the High District of the Longtown Union, Cumberland, *vice* William Graham, L.R.C.S. Edin., L.S.A. Lond., whose term of office has expired.—Assistant Surgeon J. Lalor, A.B., has been appointed Assistant-Surgeon in charge of Sindh Lunatic Asylum, Larkhana, Bombay Presidency.—Nathaniel Lawrence, M.R.C.S. Eng., has been appointed President for 1862-3 of the Buchan Medical Society.—James Jasper Macaldin, M.D., L.R.C.S. Edin., F.R.C.S. Irel., L.M. Edin., has been elected Medical Officer and Public Vaccinator for the Fifth District of the Romford Union, Essex, *vice* Mr. William Cooper, resigned.—Andrew Douglas Maclaghan, M.D. Univ. Edin., F.R.C.S. Edin., has been appointed Professor of Jurisprudence in the University of Edinburgh, *vice* Thomas Stewart Traill, M.D. Univ. Edin., F.R.C.P. Edin., deceased.—George Maclean, Acting Assitant-Surgeon R.N., has been appointed to the *Severn* for the *Pantaloon*. — Assistant-Surgeon W. J. Moore, M.D., has been appointed Acting Assistant-Surgeon to the European General Hospital, Bombay.—W. A. Morton, Esq., has been appointed Certifying Surgeon under the Factory Act for Horwich, Lancashire, *vice* Cawthorne, resigned. —Wm. Newman, M.D. Univ. Lond., M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer to Lord Burghley's Hospital St. Martin's, Stamford Baron, Lincolnshire, *vice* Mark Wilson Jackson, F.R.C.S. Eng., L.S.A. Lond., deceased.—Robert Nichol, M.D. Univ. King's Coll. Aberd., M.R.C.S. Eng., and L.M. L.S.A. Lond., has been elected one of the Medical Officers of the New Camberwell Pro-

vident Dispensary.—John Otley, F.R.C.S. Eng., L.S.A. Lond., has been elected one of the Medical Officers of the New Camberwell Provident Dispensary.—Samuel Alexander Patrick, M.R.C.S. Eng., has been appointed District Surgeon to the Salford and Pendleton Royal Hospital and Dispensary, Manchester.—John Williams Pridham, M.R.C.S. Eng., has been elected Medical Officer and Public Vaccinator for the 4th and 5th Districts of the Weymouth Union, Dorsetshire, *vice* Adam Stapleton Puckett, L.S.A. Lond., deceased.—John Dungate Featherstonehaugh Parsons, M.D. St. Andrews, M.R.C.S. Eng., L.S.A. Lond., has been elected Resident Medical Officer to the Clifton Dispensary, *vice* Robert Watts, M.R.C.S. Eng., L.S.A. Lond., resigned.—George Puckle, M.D., Univ. St. And. M.R.C.S Eng., L.S.A. Lond., has been elected one of the Medical Officers of the new Camberwell Provident Dispensary.—William Edward Robbs, M.B. Univ. Lond., M.R.C.P. Lond. (exam.), M.R.C.S. Eng., L.S.A. Lond., has been elected Surgeon to the Stamford, Rutland and General Infirmary; and Medical Officer for the Ryhall District of the Stamford Union, Lincolnshire, *vice* Mark William Jackson, F.R.C.S. Eng., L.S.A. Lond., deceased.—Alexander Samuel Samson, M.R.C,S. Eng., L.S.A. Lond., has been elected Medical Officer and Public-Vaccinator for the third or Wyke Regis District of the Weymouth Union, Dorsetshire, *vice* Andrew Chadwick Fenoulhet, M.R.C.S. Eng., deceased.—Dr. William Henry Sherwood has been appointed a Member of the Legislative Council of Her Majesty's Settlement on the River Gambia.—George Smith, L.R.C.S. Edin., has been elected Vice-President of the Buchan Medical Society for 1862-3.—John Addington Symonds, M.D. Univ. Edin, F.R.C.P. Lond., F.R.S. Edin., has been elected President of the British Medical Association for 1862-3.—Dr. Angustus Voelcker remains as Professor of Chemistry at the Royal Agricultural College, Cirencester, having withdrawn his resignation.—David Walker, M.D. Qu. Univ. Irel., L.R.C.S. Irel., M.R.I.A., F.R.G.S., F.L.S., late Surgeon and Naturalist on board the R.Y.S. "*Fox*," and now proceeding to British Columbia, has been elected a Corresponding Member of the Zoological Society of London.—George Webster, M.R.C.S. Eng., L.S.A. Lond., has been elected one of the Medical Officers of the new Camberwell Provident Dispensary.—Charles Whitefield, M.R.C.S. Eng., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Crowland District of the Peterborough Union, in the Counties of Lincoln and Northampton, *vice* Charles Sharp Smith, M.R.C.S. Eng., L.S.A. Lond., resigned.

APPOINTMENTS FOR THE WEEK.

Wednesday, September 3.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.; Royal Orthopædic Hospital, 2 p.m.

Thursday, September 4.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.

Friday, September 5.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, September 6.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital 2 p.m.

Monday, September 8.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, September 9.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

NOTICES TO CORRESPONDENTS.

O. R.—The object of the Regulation, obviously is to forbid the use of the title of Dr., except by a University graduate. These successive changes of policy involve great injustice; but we do not see what can be done.

CHIRURGUS.—It is a great row about nothing. It is too much the practice in our Profession when two neighbouring practitioners are on doubtful terms, that they get up a dispute upon what is called "medical etiquette"—a something often created for the sole purpose of fastening a quarrel to it. We decline to notice the matter.

Mr. NICHOLLS.—Yes.

Dr. COOKE is thanked.

Dr. JOHNSON.—Received.

H. S.—Mr. Bragg's charcoal biscuits are pleasant to take and likely to be beneficial. The value of charcoal as an antiseptic is well-known and there is no reason, save its disagreeableness, why it should not become a regular medicament in dyspepsia. We think that Mr. Bragg's biscuits have supplied the desideratum.

AN ASSISTANT.—The 'Lancet' has advocated dozens of such nonsensical schemes; occasionally, too without taking, the slightest pains to inquire into the antecedents of the promoters. It will come to nought.

A MEMBER OF THE ASSOCIATION.—The Society is a partnership, with this advantage, that whilst each partner cannot sue another for his subscription, anybody else can sue any one of the partners for the whole amount of the debts of the Association; so you can readily judge on which side your interest lies.

Mr. TAYLOR.—Enclosure received.

ALPHA.—We think Mr. Pollard has been hardly used. Actions of that sort might be trumped up by the score.

J. E.—The subject has no Medical interest, we therefore decline to accede to your request.

Mr. HENRY W.—1st. Certainly.—2nd. You could charge for your visit; but not for the medicines.

Mr. WILSON.—Yes, in the last week of September.

A SUBSCRIBER.—The process is a tedious one. You must get a paper from a Governor if you know one, and if you don't, you may spend two or three days in finding one; you must then have the certificate of two surgeons, one clergyman, one housekeeper, one governor, &c., &c., and, when this process has been gone through, you cannot rely upon the patient being received.

*—1st. No.—2nd. No.

Grosvenor-place School of MEDICINE, No. 1 Grosvenor place (adjoining St. George's Hospital).—Session 1862-63.

The Introductory Lecture was delivered on WEDNESDAY, OCTOBER 1st, at Three o'clock p.m., by Dr. CHOLMELEY.

WINTER SESSION.

General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Mr. Sharman.
Practical Anatomy—Mr. Lomas.
Chemistry—Dr. Wood.
Principles and Practice of Medicine—Dr. Leared and Dr. Cholmeley.
Principles and Practice of Surgery—Mr. Spencer Wells and Mr. William Adams.

Further information may be obtained of Dr. Richardson, 12 Hinde street, Manchester square, W.

Human Osteology. Messrs. MILLIKIN & LAWLEY, Surgical Instrument Makers, 161 Strand, "adjoining King's College," have a large assortment of Skeletons, Skulls, Hands, Feet, separate Bones, &c.

Articulated Skeletons, from £5; Disarticulated, from £3; Skulls, from 15s.

A Priced List sent post free on application.

N.B.—A variety of specimens of Cutaneous Diseases.

Chlorodyne.—R. Freeman, Pharmaceutist, Kennington road, London, S., informs the Profession and Trade that he has FOR YEARS MADE, and extensively supplied Chlorodyne—in one-ounce and four-ounce stoppered bottles, at 1s. 6d. and 5s. each. He guarantees it to be uniformly and properly prepared, and superior to any other makers', though their charge be ever so exorbitant; and he is glad to find that the low price at which he sells it allows the Profession to use it in common practice and at public institutions, so that its extraordinary beneficial effects are enjoyed by the poorest sufferers. Sold by all Wholesale Druggists.

The London Hospital MEDICAL COLLEGE.

The next WINTER SESSION will commence on WEDNESDAY, OCTOBER 1, 1862, when the INTRODUCTORY LECTURE will be delivered by Mr. HUTCHINSON, at Three p.m.

General Fee to Lectures and Hospital Practice, 84 Guineas, payable in two instalments of 42 Guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone £50.

Students can make Special Entries to Lectures or Hospital Practice.

Further particulars can be had on application to Dr. PARKER, Hon. Secretary, 22 Finsbury square, E.C., or at the College.

LECTURES AT THE LONDON HOSPITAL MEDICAL AND SURGICAL COLLEGE.

Medicine—Nicholas Parker, M.D.
Surgery—T. B. Curling, F.R.S., and Jonathan Hutchinson.
Descriptive and Surgical Anatomy—John Adams.
Physiology, General, and Morbid Anatomy, and Practical Histology—Andrew Clarke, M.D.
Practical Anatomy—John Couper.
Chemistry and Practical Chemistry—Henry Letheby, M.B. Lond.
Anatomy and Pathology of the Teeth and Dental Surgery—H. J. Barret.
Midwifery and Diseases of Women and Children—F. H. Ramsbottom, M.D.
Forensic Medicine—F. H. Ramsbotham, M.D.
Materia Medica and General Therapeutics — Herbert Davies, M.D.
Ophthalmic Surgery—George Critchett.
Botany—Christopher Dresser, Ph.D.
Comparative Anatomy—J. L. H. Down, M.D.
Special Operative Surgery—Mr. Maunder.

Mile-end, August 1, 1862.

A NEW AND VALUABLE PREPARATION OF COCOA.

FRY'S ICELAND MOSS COCOA.

In 1 lb, ½ lb, and ¼ lb packets.

J. S. FRY & SONS, Bristol and London.

Exhibition Prize Medal, 1862.

Bowles and Sons, Label and GENERAL PRINTERS, ENGRAVERS, &c., GEORGE STREET, MANSION HOUSE, LONDON, E.C. —Surgeons, Hospitals, and Dispensaries supplied with Gummed Labels and every description of Printing on highly advantageous terms, and of the most finished style and workmanship.

Dispensing Labels—Plain, 2d. per 100; Engraved, 4d. 100 Blanks, 2d., 2½d., and 3d. per 100 Retail, 2d. per 100. Catalogues on application.

Surgeons' Account Notes Wrapping Papers, Envelopes, &c.

Millikin, late Bigg and Milli- kin, Surgical Instrument Maker and Anatomical Machinist to Guy's and St Thomas's Hospital, No. 9 St Thomas's street Southwark S.E.

Liquor Carbonis Detergens, OR CONCENTRATED ALCOHOLIC SOLUTION OF THE ACTIVE PRINCIPLES OF COAL TAR.—A new remedy in Cutaneous affections, etc., presenting in an elegant and effective form the several virtues of the Tar, which are held in solution by the Alcohol, and thus rendered applicable to all the purposes of Hygiene, Medicine, and Natural History. As a dressing for putrid sores, where a disinfectant is at the same time desirable, the Emulsion, formed of any required strength by the addition of water, is most readily exhibited, mere agitation producing immediately perfect combination.

Prepared at the Laboratory of WRIGHT, FRANCIS, and CO., Wholesale Druggists, 11 Old Fish street, London, E.C.; and may be obtained through any Chemist.—(Name and Label entered at Stationers' Hall.)

Medical Fixture and Glass WAREHOUSE.—W. HAY, 25 Little Queen street, Lincoln's inn fields, begs to inform the Profession that he Fits-up every description of Medical Shops and Surgeries, and has in Stock a large assortment of New and Second-hand Drawers, Counters, Desks, Dispensing Screens, Bottles, Jars, and every requisite for the above.—A large Assortment of Medical Lamps.

JOURNAL

OF

Practical Medicine and Surgery.

— The pathology of *Asystolia* perfectly explains the mechanism of *angina pectoris*, and shows the connection between the two morbid conditions.

Many eminent writers, among whom we may quote Baumes, Laennec, Desportes, and Lartigue, view angina pectoris in the light of a neuralgia, expressing at the same time conflicting opinions with regard to the particular nerves which are the seat of pain and the cause of dyspnœa. Mr. Beau conceives that the neuralgia originates in the nervous system of the heart, and is inseparable from extreme and intermittent weakness of that viscus, which may be the cause or the effect of the neuralgia, but is, under all circumstances, the leading symptom of the disease, and imparts to it its well-known gravity.

Angina pectoris is not invariably accompanied by the train of symptoms enumerated by authors. Those who do not admit that it can exist without these attendant morbid phenomena, describe it as of very unfrequent occurrence, and Mr. Beau acknowledges that he has met with it three or four times only with all its characteristic signs. But pneumonia does not always show itself attended with the full series of its standard symptoms, and angina pectoris may also be deficient in certain manifestations represented as pathognomonic, but which, in fact, are of merely secondary importance. Thus palpitations and the propagation of the neuralgic pain to the left arm, are not characteristic, but accessory symptoms. The pain may occupy the left arm, or the right; it may be situated in both, or in the shoulders, and sometimes is altogether absent, and the paroxysm may occur, although the patient has not walked up an ascending surface. The fit may supervene under the influence of any movement or effort, or break out in the middle of the night, and cause cessation of life at its very first appearance. Thus the late Dr. Rilliet, of Geneva, was suddenly seized with angina pectoris while bending over a child in order to examine its chest, and, although this was his first attack, he expired in a few minutes after complaining of excruciating pains between the shoulders.

According to Mr. Beau, the pathognomonic symptoms of angina pectoris are a more or less violent oppression in the region of the heart; a change in the countenance expressive of terror; and an uneven, quick pulse, indicative of imperfect propulsion of the blood into the arteries. Now these signs obviously point to a diseased condition of the heart, and Mr. Beau suggests that the affection, consisting in a functional disturbance of that viscus, should in future bear the more appropriate appellation of *Angina Cordis*. Whether the affection originates in some anatomical change in the central organ of circulation, or does not coincide with any lesion appreciable to the anatomist, angina always mainly consists in asystolia, an arrest of the action of the heart, or, if the term used by Bièra, Shaffer, and Jahn be preferred, in an incomplete paralysis of the organ. This form of asystolia may, however, be distinguished from the *transitory fits of suffocation* frequently observed in persons labouring under organic disease of the heart, with some degree of permanent dyspnœa, by the characteristic combination of symptoms at once momentous and intermittent.

The above remarks will assist in discriminating angina pectoris from asthma, from gastric dyspnœa, and from the neuralgic pains occasionally met with in the left arm, and in the superior intercostal nerves on the same side in cases of tuberculosis. These pains have recently been pointed out by Mr. Beau in several of his patients, and in the case of the late Dr. Miquel, a distinguished contributor to medical periodicals and literature, were mistaken for angina pectoris. This disease bears a greater resemblance to the symptoms induced by the formation of coagula within the heart, but an error would here be unimportant, as in both instances the symptoms arise from the diminished energy of the contraction of the organ.

The principal causes of angina pectoris are a fatty condition of the heart, arterial ossification, rheumatism, gout, and syphilis. Mr. Beau also conceives that mental impressions may have considerable influence in producing the disease, and in bringing on its paroxysms. Dyspepsia, the excessive use of tobacco, which we have before alluded to, and which, as Mr. Bernard has shown, may in the long run occasion genuine paralysis of the heart, must also be numbered among its causes.

The points of resemblance above indicated between asystolia and angina pectoris, suggest the treatment most appropriate to the latter. Digitalis should be prescribed in order to invigorate and regulate the action of the heart, and the causes which have a tendency to decrease its energy must as far as possible be counteracted. When, for instance, a patient liable to painful attacks of dyspnœa and feebleness of ventricular contraction smokes to excess, the habit must be abandoned. Tobacco alone is not the cause of angina pectoris, and Seneca, to whom we are indebted for so graphic a description of the complaint, was doubtless no smoker. But tobacco, either by the direct action of nicotine on the heart, or by its indirect operation on the system, as a cause of dyspepsia and of subsequent loss of appetite, obviously exercises an injurious influence, which it would be injudicious to neglect in any person otherwise predisposed to the complaint under consideration.

— Plain warm baths are seldom prescribed in Mr. Beau's wards. They are in general debilitating, and in subjects already exhausted by physical and moral agencies of various kinds, this line of treatment is seldom useful. Mr. Beau has recourse preferably to alkaline or sulphurous baths, or to cold water applied with the wet sheet; the latter remedy was the only agent from which any benefit was derived in a recent case of obstinate gastralgia. The Professor also daily resorts with the best effects, in the female wards, to the Valerian bath.

It is prepared by adding to the water of a common bath an infusion of 16 oz. of dried chips of Valerian root, in six pints of boiling water. The dregs of the infusion, inclosed in a bag, are also placed in the bath.

Mr. Fort, Mr. Beau's House-Surgeon, recently published in the *Gazette des Hopitaux*, a short paper in which he speaks highly of the antispasmodic power of this mode of using Valerian. Its effects he represents as, in general, immediate. These baths have never been injurious; they almost always relieve, and sometimes effect a complete cure, an assertion borne out by the two following cases:—

"A. B., an hysterical girl, aged nineteen, had, for upwards of twelve months, been an inmate of the hospital, when Mr. Beau was attached to La Charité in January, 1862. Her symptoms were those usually observed in hysteria—viz., loss of appetite, constipation, tympanitis, intercostal, lumbo-abdominal, and vesical neuralgia; complete loss of sensation and insensibility to pain in the inferior half of the body, and pain of so intense a character in the hip-joint, as to prevent all motion, and suggest the idea of morbus coxarius.

"At the beginning of February she was for the first time placed in a Valerian bath, which immediately allayed the pain and gave rise to an unaccustomed sensation of comfort. On the very next day, appetite and sleep were restored; but three days after some cause of annoyance destroyed these good effects, and the nervous symptoms reappeared. A second bath was then prescribed, and much relief was experienced. In the course of two days, the sleeplessness, tympanitis, and neuralgic pains entirely yielded. The patient took altogether six baths in eighteen days, and her state being then satisfactory, she was forwarded to the Convalescent Hospital at Vesinet; the spurious morbus coxæ and the other nervous symptoms were entirely cured."

Mr. Fort has, since that period again seen this woman, and no relapse has occurred.

"Another girl affected with hysteria, occupied bed No. 30 in the same ward. The fits were of frequent recurrence, and the neuralgic pains so violent, that she was incapacitated from walking. Appetite was absent. The patient was obliged to preserve the most entire immobility, and the slightest contact

or the least movement elicited screams. The pains occupied all the limbs, and more especially the course of the lumbar and intercostal nerves.

"This condition continued several weeks, when on the 28th of [illegible], a warm bath was prescribed. Marked the disease, the excessive pain was much allayed, and the patient slept up for several hours, and slept calmly. On the next day the appetite returned, and the sufferings were less violent than usual. A second bath was given on the 31st of March. The improvement was now considerable, the pains entirely subsided, and three-fifths of the full allowance of food were prescribed; in a few days more, the recovery was completed."

Mr. Beau has recourse to the Valerian bath in many forms of nervous disease, such as hysteria, neuralgia, nervous emesis, nervosism, &c. An interesting case of paralysis agitans of one side of the body only, may at present be observed in the wards; the patient is a girl who for two years has been thus affected. The left arm and leg are in a state of constant agitation, consequent on loss of power. The case is one of hysterical paralysis, dyspepsia, gastric dyspnœa, globus hystericus, convulsive paroxysms have all existed in succession, and the anæsthesia is more marked on the left side. Since she has been admitted into hospital, generous food has been prescribed and every day a Valerian bath from which she derives much relief. After ten day's treatment the agitation of the arm subsided, and in all probability if the patient can be induced to persevere, a complete cure will be effected by the Valerian baths, aided by invigorating diet.

HOSPITAL OF THE SCHOOL OF MEDICINE.

(PROFESSOR NELATON'S WARDS.)

Melanic Growth Cured after Four Successive Operations.—Mr. Clémeaux's Operation for Hare-lip; Metallic Sutures; Chloroform.—The Padded Apparatus in the Treatment of White Swelling.

Experience shows that the surgeon should repeatedly have recourse to amputation in cases of cancer, and that a time comes when the disease seems to have exhausted its power of reproduction. The fact was well known to Blandin, who frequently alluded to it in his clinical lectures; we have observed in the wards of Messrs. Chassaignac and Démarquay several cases which illustrate its truth; and a few weeks ago, Mr. Nélaton produced in his lecture room a man, who has undergone four successive operations for the removal of a melanic growth, and who seems at last to be delivered from his inveterate enemy.

The case was one of an embarrassing and obscure nature; it was chosen twelve years ago for the theme of a lecture in a competition for the chair of clinical surgery, and entirely baffled the ingenuity of the candidates. Mr. Gosselin, who at the time had charge of the surgical wards of the Hospital of the School of Medicine, performed an operation for the removal of what he conceived to be an indurated gland, and failed in effecting a cure. He was surprised to find that the tumour was of a dark colour, and that the mass was hard, irregular, and voluminous; the gland had undergone the melanic degeneracy. The disease having relapsed after an interval of six weeks, Mr. Giraldès performed a second operation with the same unfavourable result. The patient was then dismissed, remained absent for five or six months, and was again operated on by Mr. Jarjavay. Mr. Nélaton, who, in the interim, had been appointed to the chair of clinical surgery, found this man in his wards. His condition was then most unpromising; the surface of the growth was ulcerated, bleeding, and it had considerably increased in size. The general health of the subject was, however, unimpaired, the muscular system well developed, and the outward appearance satisfactory. Mr. Nélaton determined on attempting the utter eradication of the tumour, and was compelled, in effecting his purpose, to expose the axillary plexus, the subclavian artery and vein, the lower part of the internal jugular and the phrenic nerve; in short, to dissect the entire region. This formidable operation was instituted ten years ago, and nothing hitherto has occurred of a nature to cause any apprehension of a relapse. A cicatrix, three and a half or four inches in length, now occupies the seat of the wound, which extended at first to six inches in every direction.

It is well to take due note of this case, the importance of which is enhanced by the fact that melanic growths relapsing very readily, the surgeon often despairs of being able to effect a cure, and, by declining to interfere, dooms the patient to inevitable death.

— An infant, aged eleven days, was recently operated on by Mr. Nélaton for a remarkable variety of hare-lip. The nose was flattened, the gap involved the alveolar ridge and the palate, and the deformity was considerable. In this instance, Mr. Nélaton resorted to the procedure recommended by Mr. Clémeaux, of Rochefort, which seems well calculated to prevent the possibility of the formation of an unsightly notch after the lips of the fissure have been brought together. The operation is conducted as follows:—Let us first suppose a case of hare-lip not extending into the nostril, and limited above by an angle formed by the soft parts. Instead of cutting away in the usual manner the blunt edge of the fissure, its margin is merely detached by an incision running round the upper angle and both sides of the division, down to a short distance from the lip. Thus a single, loose flap is dissected, moveable in the entire of its extent, but still attached at both its extremities to the edge of the lip, and, when lowered with a blunt hook, exposes a lozenge-shaped aperture, the four sides of which are bleeding. To these, sutures are applied, and instead of a notch, which Mr. Mirault's ingenious method does not always succeed in preventing, a prominence is obtained which not only has the advantage of constituting a suture endowed with life, but also of obviating a conspicuous defect.

By this procedure, union must take place at the lower part of the wound, because a bridge remains unbroken at the lower extremity of the fissure, forming a natural connection in every respect superior to any artificial suture; and even in cases in which the ligatures above have failed in securing adhesion, the lozenge-shaped orifice fills up by granulation, thanks to the persistency of the living band preserved from the knife. It may be objected, it is true, that the operation is delicate and tedious, when compared with the mere paring of the fissure with scissors, but the duration of the procedure is of small import if its consequences are more satisfactory. Some fear has also been expressed that the corrugated flap may form an exuberant protrusion of deformed aspect, and thus substitute one irregularity for another; but the apprehension is perfectly unfounded; experience shows that after some swelling, and even occasional turgidity, the fleshy substance alluded to contracts, and that no subsequent excision is ever necessary.

In the performance of the operation, Mr. Nélaton always recommends attention to the necessity of using a very narrow, straight bistoury; also to the propriety of securing the lip with a tenaculum, instead of the forceps, which has but an insecure hold of the part. The incision can thus be made with all desirable precision.

The question of sutures is one of some difficulty. When the patient is an infant less than a fortnight old, the tissues have but little resistance, and are easily cut through; hence the precept of withdrawing the needles after twenty-four or thirty-six hours at the farthest; in forty-eight hours, in general, the ulcerative process may be complete and endanger the results. But primary union is barely effected in twenty-four hours, and the surgeon may well feel some degree of embarrassment as to the safest course to be adopted. Now the procedure imagined by Mr. Clémeaux already affords some security against the chances of disunion or of incomplete union; but the metallic sutures recently introduced into practice remove all further uneasiness in this respect.

In the case which suggests the present remarks, Mr. Nélaton placed five silver wires, which he twisted and left *in situ* for a week. When they were withdrawn, on the eighth day, it was gratifying to remark that they had occasioned no ulceration

whatever, and on the tenth day after the operation no trace of their presence was perceptible. The case is therefore one of considerable practical interest. We should not omit to state that, before removing the wires, Mr. Nélaton unhesitatingly had recourse to chloroform. An assistant brought forward the infant's cheeks with both hands, while another held beneath the nose a compress impregnated with the anæsthetic. The child's screams soon subsided, and he slept; the five wires were then extracted with scissors and forceps, and the lip was dressed with a piece of fine linen covered with collodion.

— We alluded some twelve months ago (ART. 6016) to a case of elephantiasis in which Mr. Nélaton effected considerable improvement by the application of peripheric pressure with the cotton-wadding bandage recommended by Mr. Burggraeve, of Ghent. This apparatus deserves to be better known, and the benefits which can be derived from it in cases of localised arthritis, and white swelling, merit especial notice.

Pressure, as a method of treatment of these often painful and always tedious affections, has been highly spoken of by Professor Velpeau, but various appliances may be used for the purpose, and we conceive that a short description of the cotton-wadding bandage, the most efficient of all to satisfy the important indication in question, may not be wholly without interest to our readers.

The apparatus consists in a form constructed with cotton-wadding, pasteboard, and linen rollers. The interposition of cotton between the integument and the other parts of the bandage obviates the possibility of any undue constriction, and at the same time secures the perfect stability of the whole. The cotton-wool equalises, and by its elasticity renders the pressure permanent. It yields to the turgescence of the parts enclosed within the apparatus, and when the swelling subsides the cotton fills up the space existing between the integument and the unelastic envelope, and whatever the amount of turgidity or of subsequent shrinking of the limb, no vacant interval ever forms such as would require incision of the shell for the purpose of loosening or tightening the apparatus. In cases of white swelling, the limb should be first covered with a layer of cotton-wadding, especially thick around the diseased joint; pasteboard splints are then laid over and secured with a roller, the turns of which are consolidated with dextrine or starch paste. The cotton should be fine, carded wadding, and not gummed, because gum deprives it of its elasticity, and the pasteboard should be moistened in order to adapt itself easily to the shape of the parts.

For several years Mr. Nélaton has adopted this system in his private practice and in hospital, and he confidently asserts that no bandage is equally efficacious in the treatment of white swelling.

ART. 6279.

AURAL SURGERY.

Anchylosis of the Ossicula Auditus.

The minute articulations which connect the ossicula are supplied with a synovial and a capsular membrane, and are subject to the same diseases as other arthrodial joints. One of these affections presents especial interest, inasmuch as it more or less seriously imperils the auditory function, I allude to anchylosis of the ossicula.

This is an anatomical change frequently consequent on rheumatism, gout, or syphilis, and is, moreover, almost invariably the result of chronic and especially of catarrhal inflammation of the middle ear. Anchylosis of the ossicula was first described in 1743 by Hoffmeister, of Leyden, and was for a long time looked upon as an insignificant nicety of pathological description. I must myself plead guilty to the charge of having overlooked the practical utility of a careful study of this lesion, which is, however, repeatedly alluded to in my *Practical Treatise on Diseases of the Ear*, published in 1856. I was at the time impressed with the idea, that accurate diagnosis of this condition could scarcely be hoped for in the living subject, and that the only treatment calculated to be of service, was that which is usually resorted to in nervous deafness. In both diseases the function is much impaired, and is sometimes almost entirely abolished; the *membrana tympani* is transparent, and the Eustachian passages are free from obstruction. In both, tinnitus and torpidity of the organ are present, and the similarity of the anatomical and physiological symptoms tends to create a confusion which it is not easy to avoid.

It is not, however, quite impossible to establish the diagnosis with precision, and, if an appropriate course of treatment is resorted to in time, improvement, and sometimes even a complete cure, may be expected to follow.

I have had many opportunities of meeting with anchylosis of the ossicula, and the following brief description is delineated from the cases I have personally observed:

Anchylosis of these minute articulations may be *complete* or *incomplete*.

Incomplete anchylosis is usually attended with simple hypertrophy or thickening of the mucous membrane. The periosteum of the ossicula, being but an expansion of the mucous lining of the drum, any condensation of the latter will naturally interfere with, without absolutely abolishing, the mobility of these little bones. In general, the indurations are the result of plastic inflammatory exudation along the chain of the ossicula, and are almost invariably situated on the internal wall of the tympanum, near the margin of the fenestra ovalis. They impede the freedom and regularity of motion of the stapes, but do not, however, utterly destroy hearing. More or less, considerable deafness is induced, but the patient, especially when seated in a railway car, in a common carriage on a rough road, or with the assistance of a large ear-trumpet, can still distinguish loud intonations.

Complete anchylosis is the consequence of four different anatomical changes—viz., 1. An expansion of the thickened articular capsule may project over the plate or foot of the stapes, or the head of the malleus, fixing the latter to the incus, or over both the stapes and malleus. 2. The plate of the stapes may be attached by a firm fibrous band to the petrous portion of the temporal bone, or the malleus and incus may be closely united in a similar manner. 3. The stapes and malleus may both be immovably fixed in their situation by a fibrous band presenting calcareous deposits. 4. The stapes may be attached by ossification to the fenestra ovalis. The two latter anatomical changes are extremely common consequences of gout or syphilis; the former are more usually met with in subjects suffering from catarrh or rheumatism.

The morbid union of the ossicula to each other and to the promontory, induces in the osseous chain and in the aspect of the membrana tympani, changes deserving of attention. In well-marked cases, the manubrium of the malleus is displaced downward, and carries with it the short process of the incus. The membrana tympani undergoes a corresponding alteration, and its external surface loses its concave form, and now bulges outward, presenting the appearance of two inclined planes united at an angle, the summit and prominent edge being constituted by the extremity of the manubrium of the malleus. This curious morbid condition is of much importance as a most trustworthy sign, not only of the existence of anchylosis, but of the presence of fibrous attachments with the promontory.

The most frequent causes of anchylosis of the ossicula, are gout, rheumatism, and chronic catarrhal inflammation of the middle ear. Syphilis and scrofula induce it less usually, and give rise to manifestations of a different character, such as suppuration, fungus, caries, and necrosis. They may, however, affect the ossicula and their articulations, and deposit on their surface morbid products of plastic, fibrous, and even osseous nature. Careful dissection also distinctly establishes the fact, that in all forms of otitis, more especially in the catarrhal variety, the mucous lining of the tympanum becomes tumefied; if the inflammatory action is not promptly checked, and is allowed to become chronic, the membrane which invests the ossicula soon presents partial indurations and thickenings, which constitute the first anatomical variety we have described. When these changes occur along the chain of the ossicula, their joints lose their mobility; and if they occupy the in-

ternal wall of the drum, or the margin of the fenestra ovalis, their effects are especially injurious.

The symptoms of the disease may be classed under the separate heads of anatomical, physiological, and historical.

Anatomical signs.—On inspection of the ear, the meatus externus is found in a healthy condition, occasionally containing a small amount of dark and inspissated cerumen. The membrana tympani is transparent, or slightly clouded. But the handle of the malleus is more or less prominent at its insertion, and projects sometimes in so marked a manner, as apparently to extrude through the membrane. The latter is not thickened, nor does it present unusual vascularity. By insufflation, air penetrates freely through the Eustachian tube into the tympanum, causing one or two sharp clicks. But during forced expiration, the nose and mouth being closed, if the observer applies his ear to the mastoid, a coarse crepitation becomes audible. When this sign is distinctly present, no doubt can be entertained as to the existence of incomplete anchylosis. If the ossicula are entirely immoveable, no sound whatever can possibly be produced, either during insufflation or expiration. The minute articulations are completely ossified, and no resonance is audible in the explorations referred to.

Physiological signs.—Although pain is very rarely complained of in this affection, the progress of which is essentially chronic, tinnitus aurium is seldom absent, but it is common to most affections of the ear, and in this instance, is not invested with any peculiar distinguishing character. The sense of hearing is extremely dull, and on this point we may confine ourselves to the remark, that if the surgeon, after illuminating properly the meatus, gently touches the membrana tympani with the extremity of a blunt probe, in the point corresponding to the insertion of the malleus, the patient experiences the transitory sensation of faint and distant sound. The anchylosis may then be pronounced to be incomplete, and some hope of an ultimate cure may reasonably be entertained.

The *historical signs* may give valuable assistance in obscure cases. When, for instance, the patient is subject to attacks of rheumatism or gout, or if he is the child of gouty parents; if he suffers from catarrhal disease, granulation of the pharynx, or syphilis, information on these various points leads to a correct diagnosis, which will derive further confirmation from the careful interpretation of the signs above enumerated.

We may state as a concluding remark with regard to diagnosis, that the practitioner can here hesitate, but between *chronic catarrh* of the middle ear, and *nervous deafness*, and that the mistake of one for the other must frequently occur. In chronic catarrh of the middle ear, however, the membrana tympani preserves its concave shape and its transparent aspect, and no dry crepitus is audible, but only mucous sounds. It is fair to add that, moreover, at an advanced stage of the disease, the leading symptoms of catarrh are similar to those of anchylosis of the ossicula. Nervous deafness is readily known by the total absence of the ceruminous secretion in the meatus, by the perfect transparency of the membrana tympani, by the preservation of its natural form and situation, and of the connections of the ossicula, and especially by the absence of mucous sounds or crepitus. The local morbid excitement, and tinnitus are in addition considerable, and the latter is generally isochronous, with arterial pulsation. These various dissimilarities supply all the elements of the differential diagnosis.

The prognosis of anchylosis of the ossicula is in general unfavourable, but less serious, however, than the judgment to be formed on the course and event of other forms of deafness, due to disease of the auditory nerve. The gravity of the affection is to be estimated by comparison, and in many instances admits of the possibility of improvement, provided the articulations are not bound by osseous or fibro-cartilaginous adhesions. The chances of amendment will be greater if the treatment has been instituted at an early period, when the morbid attachments are yet plastic, and consist only of hypertrophied and indurated mucous tissue.

The treatment should be both local and general. Locally, fumigations of the external ear at first, and subsequently of the Eustachian tube and tympanum, should be resorted to. Those I have found most successful were performed with the liquor ammon. acetatis, and acetic acid. When the inflammation of the tympanum, which has given rise to anchylosis, has not entirely subsided, it will be proper to prescribe local depletion, and even issues behind the ear, or to have recourse to cauterisation of the pharynx, if it be the seat of obstinate granulation. General remedies must at the same time not be neglected. Of course gout, rheumatism, or syphilis, must receive the practitioner's careful attention; but we may confidently recommend as extremely serviceable, sulphurous douches (gaseous and liquid), calomel and opium, and the internal exhibition of iodide of potassium.

TRIQUET, M.D.

The Medical Circular.

REVIEW OF THE PERIODICALS.

The 'American Medical Times' opens with a continuation of Dr. JACONI's Lectures on *Dentition and its Derangements*. We extract the following remarks:

"The equality of a portion of the symptoms in a large number of cerebral diseases is a well-known fact. The prevalent liability to one of them—viz., convulsions—is a peculiarity of infantile age. The smallness of the large hemispheres explains the suddenness of the loss of consciousness in very young children, the undeveloped condition of the cerebellum, the loss of power over every one of the voluntary muscular actions; thus convulsions are a very frequent occurrence in very early infancy, and it can be said, that the number of cases decreases with every month. This is positively true, and the often-repeated statement of the greater frequency of convulsions during dentition—that is, during and after the second half-year, is a mistake. My own experience, moreover, has not been able to convince me of an assertion I have often heard from good observers—viz., that the period of the second dentition should be more fertile in attacks of convulsions than that immediately preceding. Let us see, however, on which facts this assertion is based, and whether or not dentition, either first or second, is so very influential in producing convulsions, that the diminution of attacks with increasing age should be essentially interfered with. It will be our main object to investigate the principal causes of convulsions in infantile age, the place among these causes which can reasonably be assigned to dentition, and, thirdly, the manner in which the protrusion of a tooth can become the cause of an attack of convulsions."

The author then recites the various causes of the convulsions, such as anæmia, hyperæmia, affections of the brain, primæ viæ, urinary and sexual organs, &c.

Dr. GEORGE ELLIOTT contributes to the same journal reports of *Difficult Obstetrical Cases*. The following case presented a form of difficulty sometimes met with. We have seen chloroform fail in removing the muscular constriction as it failed in this instance:—

"*Brow presentation—Forceps and version failed in consequence of the powerful unyielding contraction of a circular band of uterine muscular fibres; perforator, crotchet, and craniotomy forceps having also failed, the patient was finally delivered with the cephalotribe—Chloroform.*

Mrs. —— fell in labour with her fourth child on the night of the 6th of March, 1862, under the care of Drs. Mr. Nelaton, using a very many of securing the brim was somewhat undersized, and her previous labours had been slow on this account, but had terminated successfully both to mother and child without interference. Dr. Case informed me, when he came for me, that Dr. Bishop had failed to deliver either by version or forceps, and being thoroughly acquainted with his great ability in obstetric operations, I took my cephalotribe with the other instruments. By the time of my arrival, March 8th, the waters had been discharged for more than twelve hours. The brow presented, with chin directed to the right sacro-iliac synchondrosis; os fully dilated; child evidently full size. No advance had been made through the brim, nor was there any arrest by any portion of the pelvic brim; on the contrary, flexion could be very readily brought about, and the presentation converted into that of the vertex. When this had been accomplished, the posterior fontanelle was directed to the middle of the left ilium, and my forceps were readily applied by passing the first blade in front of the left sac.-il syn., and carrying the other directly to its place behind the right acetabulum. But my strongest tractions failed to do more than reproduce the brow presentation. A repetition of the manœuvre had the same effect. In short, the head would turn as it were upon a pivot, but not advance in its totality. One blade used powerfully as a vectis accomplished nothing. It was evident that neither Dr. B. nor I could accomplish anything in this way. Proceeding to turn, I then found exactly what Dr. B. had described—viz., that the arrest

was due to a circular uterine band, tetanically contracted a little below the shoulders of the child. Thus the knees were above this circular constriction on the right side of the uterus, and I toiled vainly without being able either to bring one down, or to push a leg by pressure from above through the right side of the uterine wall. All efforts at version by external manipulation alone, or conjoined with the hand in the vagina, failed also, when I recommended craniotomy.' Before doing so, however, Dr. Bishop again renewed his efforts, and succeeded in bringing the left foot to the brim of the pelvis, from which place we could advance it no further nor push up the head.

"*It is important to mention that during the operations of Dr. Bishop before my arrival, chloroform had been given, and that during all these efforts, Dr. Case kept the patient as profoundly under its influence as possible, without in any way relaxing the tonic spasm of the fibres referred to.*

"Careful exploration now enabled us to reach a loop of pulseless funis, and thus, all objections to craniotomy being removed, I opened the head, and broke up the brain. Both the crotchet and the craniotomy forceps broke away piece after piece of the well-ossified head without advance. Under these circumstances, with the full approbation of the gentlemen present, I took the cephalotribe (Scanzoni's), and without any difficulty locked it, and crushed through one diameter. Still my tractions did not avail, and it was thought better that it should be reapplied, in an opposite diameter, which was again readily effected. Having again crushed through the fœtal skull, by the unyielding grasp of this powerful tractor, I withdrew the head and overcame the obstacle. The child was a male, and of large size. Leaving the placenta to the management of Dr. Bishop, I was surprised to be called again to the bedside, to notice the curious way in which the constriction described had reproduced itself, or rather, perhaps, had steadily advanced with the altered uterine bulk, and now retained the placenta in an imperfect hour-glass. This, however, did not make the removal of the afterbirth (which was not adherent) an operation of difficulty, though it necessitated the introduction of the whole hand. In so doing the brim of the pelvis and lumbar vertebræ were carefully explored.

"Without the aid afforded by this powerful yet thoroughly manageable cephalotribe, I do not know how long it would have taken to overcome the singularly strong and tenacious grasp of this tonic uterine spasm."

We extract from the same journal a notice of some observations, by Dr. Edward H. James, on *Cantharides as a Therapeutical Agent.*

"The internal administration of cantharides in large doses, with the mode of its operation, forms the subject of a paper published in the 'Cincinnati Lancet and Observer,' from the pen of Dr. Alex. McBride, Surgeon O. V., U. S. A., who strongly advocates it as 'an agent the most powerful to rekindle the waning spark of vitality—an agent which in many cases of disease at an almost helpless stage, will rally the scattered and almost dissipated vital forces, concentrate and generalise their action, and re-establish that series of atomic changes upon which vital action depends.' He was led to the investigation of the subject in the year 1854, when typhoid and continued fever prevailed to a considerable extent in northern Ohio, and he frequently saw patients in whom congestion of the lungs had supervened at an advanced stage of the fever. These were treated with the application of emplast. canthar., and in many cases with marked success, and the observation made that in those cases that were at all remediable, the abatement of bad symptoms began within thirty minutes after the application of the plasters, especially when applied over a large surface. An effect so prompt could not be due to vesication, but was supposed to depend either upon the plaster acting as a poultice to the warm part, or the absorption of cantharides. The latter theory seemed more rational to the writer, and he resolved to try the result of cantharides when administered internally, and now reports a number of cases illustrating its happy effects. The first case reported is that of a feeble woman, aged fifty, who had long suffered from an obscure remittent fever, and every few days reduced still lower by a 'sinking' chill. During one of these chills sixty minims of tinct. cantharides were administered at once, from which she soon rallied, and from that time her recovery was uninterrupted. Other cases are reported, comprising one of extreme nervous depression, partial palsy, typhoid pneumonia, animal poisoning, gangrenous erysipelas, low stages of typhoid fever, cholera, &c., in all of which rapid improvement is said to have followed the first administration of the remedy. The dose was usually from ℥ss. to ℥jss. of the officinal tincture, sometimes alone, sometimes in combination with ammonia, or camphor, or quinine, or iron, as each was indicated, or alternating with the iodide of potassium. In none of the cases did strangury occur, and he says it will not where the peculiar action of the remedy is plainly and clearly indicated, which means that stage of the disease which authors have pointed out as the 'blistering stage.' He does not disparage blistering, but in urgent cases has applied them in connection with the internal use of the tincture; but in extreme cases we cannot wait for the absorption of cantharidin through the skin, 'when vitality and blood have almost forsaken the surface,' the internal administration of large doses becomes necessary to insure a speedy action. As a general indication for its use he gives the following:—'*When in a tonic, asthenic, or adynamic disease it is a desideratum, from whatever cause, to produce general or local capillary tonicity, the internal use of cantharides will be indicated, and in quantity proportional to the urgency of the demand.*' And again: 'When turpentine is indicated to produce general action, cantharides is still more indicated, if the indication is urgent; but they should not both be given.' When it is determined to use the cantharides internally, a full dose (one drachm, or perhaps more) should be given at once, after which smaller doses will generally suffice. Its repetition should not be trusted to incompetent hands, but the prescriber himself should as far as possible administer it, remembering that like all potent drugs it is as capable of doing mischief as good, and should only be given to a sufficient extent to accomplish the object desired: for if it acts by re-establishing the series of atomic changes upon which vital action depends, a too free exhibition may urge these changes beyond the point of endurance, the tendency of which would be to destroy. The writer believes cantharides to act primarily upon the capillaries, by inducing tonicity, diminishing their calibre, whereby congestion is relieved and absorption promoted; and that its action upon the general constituents of the organism throws a large amount of nitrogenized effete matter into the circulation, which the kidneys elaborate into urine, which increases the quantity of dense urine; and he has noticed the fact that so long as the urine is dense there is no strangury, but when it grows pale the quantity grows less, and if the medicine is continued strangury will follow. Hence we have the following rule:—'*Cantharides may be given in free dose (in cases where indicated) as long as the urine continues of a darker colour than pale amber.*' After some observations on the local and general effects of cantharides as usually administered, he thus concludes:—'Now, in conclusion, I wish to say that I have written the foregoing facts because they are true, and ought to be known to the profession; and for the few conjectures submitted, I ask your indulgence till they are further considered.'

"The same journal contains a report by Dr. G. R. Patton, on *The Use of the Seeds of the Pumpkin in Tænia.*

"A number of cases are reported, all of which had repeatedly undergone the usual routine of treatment. An emulsion was made with two quarts of the hulled seeds and two quarts of water, and a large tumblerful given three times a-day, preceded by a light diet and free evacuation of the bowels. The effect was in all the cases to bring away large pieces of the worm, in some of which the head was found. He thinks the pumpkin seed claims our first attention as an exterminator of tænia, the frequent failure being due to discontinuing the remedy too soon. The treatment should be maintained from four to six days, unless the head be discovered, the patient being confined to a light diet. No purgative should be used during its use, as the emulsion itself is sufficiently laxative, if a light diet be enforced."

Any suggestion that may prove useful in the treatment of *Scarlet Fever* should be received with favour; we, therefore, extract this notice of a fermentation of hops and vinegar, recommended by Dr. A. Searle:

"One simple but very efficient application to the neck in the commencement of these troubles, is hops and vinegar, applied in the following manner:—Take a strip of cotton cloth, five or six inches wide, and of sufficient length to reach round the neck and fasten; then place a handful of hops in a row, nearly the whole length of the cloth; then fold the cloth over the hops, and run the edges of the cloth together with the 'running stitch;' then in the form of a stock, dip in boiling vinegar, and when sufficiently cool, apply it around the neck, and constantly wear it through the whole course of the disease, excepting to be renewed occasionally, when dry, by dipping in hot vinegar again. This application had been suggested to me by a lady friend who had tried it, and after condescending to examine the nature and effect of this remedy, I have thrown aside every other, and adopted it in every case of scarlet fever, especially where there is any tendency to glandular complication. I will venture the statement, and say I had rather dispense with any and every other application, internal or external, excepting the medicine to be given at the commencement to prepare the system for a course, than to dispense with the application of hops and vinegar to the neck. In the very nature of the disease the tendency is to the worst kind of inflammatory complications in the glands of the throat and neck. Now, as a kind of negative prophylactic, we must avoid every kind of application that will unduly irritate the skin, and prevent the free perspiration and exhalation of morbid matter through the pores, such as mustard cataplasms, ice and cold applications, greasy salt pork, cupping, scarifying, leeching, and blistering. The tendency of the disease is also to mortification of the parts especially, and hops and vinegar are a suitable antiseptic. It produces the right kind of counter-irritation. It does not abrade the skin, and thus prevents the

patient from suffering any undue amount of irritation. It produces a salutary fermentation, and a glow of agreeable heat throughout the whole system; and, in fact, produces a general perspiration, equalizing the excitement, reducing the heat, and expelling a great deal of morbid matter from the circulation. In proof of the above good effects of this cataplasm, I can say I have always had the best of effects—that is, when I have had the whole control of the case. One case of a child seven or eight years of age was attended with delirium, and was comatose, in which state he was left by his physician as hopeless. I was called in the night, and prescribed the stock of hops and vinegar, saffron tea, etc. The effect was a sudden restoration, without any other treatment of importance. I was in New York city about eight years ago. A gentleman with whom I was acquainted was doing business there. He had just lost two children with the scarlet fever, under the care of Dr. S., a celebrated physician. Another child, the only one he had left, at the time, was then taken with the disease. He inquired of me what they should do. I told him of the hops and vinegar, and the mild treatment. He was going immediately by railroad. On arriving, he informed the family of the hops and vinegar, and inquired of the doctor if it would answer, as though it might be improper or dangerous. The doctor made light of it, as of not much importance, but he consented to its application, and the child recovered, and is still living."

The 'Medical Record' (Australia). Dr. C. E. Reeves communicates the followiug article on *Diseases of the Stomach* with especial reference to the specific influence of the acetate of lead in pyrosis:

"I am only acquainted with two cases in which it occurred before the 12th year; in several others, however, which came under my notice, it had set in about the 20th year. As a rule, it is seldom observed among males, particularly when it occurs in connection with disordered digestion, before the 30th year, but in females, from disorder of the functions of the womb being very apt to excite gastric derangement, it may occur earlier; but in the latter it is more commonly observed from the 35th to the 48th year—about the period of the cessation of the menstrual discharge—than any other. Of 51 males, 3 were under 30 years; 18 from 30 to 35; 18 from 35 to 40; of the remaining 13 cases 11 were under 50, and 2 beyond, being 53 and 56. Of 78 females, the youngest was 19 years of age; 18 between 20 and 30; 13 between 30 and 40; 23 between 40 and 50; 18 between 50 and 60; the remaining 5 cases were beyond 60—one being 70. The above table refers only to the ages of the cases when they came under treatment; a great number of them had suffered for some years.

"*Complications.*—The most common were disease of the womb, or disorder of its functions and chronic gastritis. In some of the cases chronic bronchitis, pulmonary emphysema, and disease of the heart, particularly hypertrophy, was observed; the patients were generally elderly females. In several of the cases in which the affection depended on duodenal irritation, nettle-rash was observed; gout, rheumatism, and psorias was observed in a few of the cases. The following was the state of the menstrual discharge in the 78 cases:—In two the patients were pregnant, 1 had profuse salivary discharge; in 5 the menstrual discharge was regular and natural; in 2 the water-brash was worse during it; in 11 it was regular, but there were profuse leucorrhœal discharge; in 19 scanty, regular or irregular in its appearance; in 6 of the number there was profuse leucorrhœal discharge; in 41, it was suppressed; in 28 naturally, but a great number had suffered before this had taken place; in the 13 remaining cases it had ceased since the occurrence of the water-brash; in 7 of these cases there was profuse leucorrhœal discharge.

"Chronic gastritis is a very constant complication. In all the cases in which the fluid was rejected after food, this or some other irritation of the stomach or duodenum existed. In the large towns it constantly occurs from this cause, and in nearly all the cases the sufferers followed sedentary occupations, or they had to make exertion immediately after food; This, by interfering with the process of digestion, had produced gastric derangement, and then the water-brash occurred.

"Dr. Copland observes (*Dict. of Medicine:* art., Pyrosis), 'that it has been attributed to the use of rye, barley, oats, and potatoes, and the want of animal food. The use of unfermented or unleavened bread has been supposed to induce it. The share which these have in producing this affection can scarcely be determined. But it is also prevalent in countries where dried and smoked meats are used, or dried fish—both the meat and fish being prepared without salt, or with but very little.'

"It has been observed by Grasser to rage epidemically. It is endemic in Scotland, Sweden, and Norway; the Laplanders, who live near the mountains, are particularly liable to it—one half of them suffer—both males and females being equally susceptible.

"I have noticed it in the country districts of England among the poor. Exposure to cold and wet, and a poor diet, seemed to have a great deal to do with exciting it.

'*Duration.*—Linnæus states that some of the Laplanders suffered through life. Heberdeen has seen the same occur. From its tendency to return, those who became subject to it when young will be nearly certain to suffer, more or less, from it through life. In one case which came under my care the patient, a male aged 40, had suffered since he was 18; in a female, aged 70, off and on since her 40th year; in another, aged 62, many years off and on—her brother also suffered. In several other cases it had existed from ten to fifteen years. It is very common to find that it had existed for one, two, three, and even four years. In a case which Dr. Martin, of Collins street, kindly brought under my notice, the patient a female, aged thirty-one, for years in the colony, had suffered at times for ten years. In this case there was every indication of ulceration of the posterior wall of the stomach, with implication of the pancreas. She had severe pain in the spine, shooting up the sides along the intercostal spaces; pressure on the epigastrium excited pain, which passed through to the spine. Her mouth was constantly filled with watery fluid, it ran out wetting the pillow when she was asleep, and she had severe pain, of a twisting character, for a quarter of an hour before the fluid came up. She suffered severely after a long walk, and while suckling, and throughout her pregnancy, with vomiting of food. She vomited solid food, and sometimes food of the lightest character. Bowels confined, menstrual discharge regular, leucorrhœal profuse; her womb had a tendency to fall. The relief from the acetate of lead in this case was immediate.

"*Mode of Employment.*—I have generally given it in doses of from half to one grain, three times a day, combined with an eighth or a sixth of a grain of opium, in a pill. It is necessary to watch its action. In those cases in which the strength has been much reduced, the blue line on the gums, and then colic will appear early; but by regulating the action of the bowels, by a dose of castor oil, twice or three times a week, the occurrence of the latter may be often prevented, particularly if the dose is lessened, as soon as relief is obtained. The patient must be at the same time placed on a strict diet. Tea, coffee, and beer generally act injuriously, they must therefore be prohibited. The following is the plan which I recommend:

"1. To sponge the body with tepid or cold salt and water every morning, and then rub it for five minutes with a coarse towel or flesh-brush, until a glow is produced.

"2. To take cocoa made from the nibs, or milk and water, with dry toast, for breakfast and tea. In some cases half milk and half water disagrees, but one-third or one-fourth milk, or the addition of a tablespoonful of lime-water, or ten grains of calcined magnesia will generally prevent this.

"3. For dinner fish with fine flesh, with dry bread, vegetable marrow, brocoli, cauliflower, asparagus, seakale, or any other soft vegetable; potatoes sometimes disagree. Oysters generally agree well, they may be taken two or three times a day. The fish alone is seldom sufficient to nourish the patient; beef, mutton, chicken, or veal tea must therefore be taken between the meals. Care is necessary to prevent the patient taking too much at a time; if a teacupful disagrees or excites distension, two-thirds or half a cupful should only be allowed. Patients are better without any stimulant, but if they demand one, two or three teaspoonsful of brandy, in a tumbler of water, may be allowed. Strict attention to diet and the action of the bowels will be necessary for some time, for irregularities in the former, or allowing the latter to become confined, is very liable to re-excite it."

'British Medical Journal' (August 30.) An interesting article on *Compound Comminuted Fractures of the Skull*, is communicated to this Journal, by Dr. A. Wynn Williams. Of one case he says:

"On examining his head, I found a depression over the upper and frontal end of the right parietal bone, in the centre of which was a fistulous opening discharging offensive pus; introducing the probe, I detected several pieces of loose bone. I made a crucial incision through the integuments, and, after dissecting back the flaps, perceived a fissure in the skull of about half an inch in length from before backwards, and somewhat less from side to side. After cutting away the callus that partially filled it up, I succeeded in picking out eighteen small roughened spicula of bone. I could then distinctly see the pulsations of the somewhat roughened dura mater. Considering it possible that there might be still some spicula remaining, I filled up the wound with lint to prevent its healing. At the expiration of a week, finding that the wound continued to discharge offensive pus, I made another examination with the probe, and discovered a piece of bone, lying under what appeared to be healthy bone, which I was unable to draw out with the forceps. Not liking to remove a piece of sound bone out of my patient's skull if it could be avoided, either by the trephine or the saw, I notched the bone on each side of the opening with a pair of strong bone-nippers, and through the opening, thus enlarged, succeeded in abstracting a piece of the inner table quite smooth on its under surface, of the shape and size of the half of a half-a-crown piece, together with several smaller ones. The whole number on this and the previous occasion amounted to twenty-four. I kept

them by me for several years ; but on my removal from Carnarvon to London they were, unfortunately, lost. After their extraction, the wound closed, and the man shortly returned to his work."

He reports two more cases of a similar character, and in the course of some general observations on the symptoms of fracture of the skull, remarks :

"The splintering of the inner lamina of the skull to a greater extent than the outer, has, until very lately, been attributed to its greater brittleness. Mr. Erichsen, however, does not consider this to be the only cause. He remarks, 'I should rather attribute it to the direction of the fracturing force from without inwards, causing a certain loss of momentum in passing through the outer table ;' and instances the case of a man who discharged a pistol into his mouth, the bullet passing out through the vault of the head, the larger fracture being in the outer lamina. For my part, I think there is another cause besides the brittleness of the inner table, or the loss of momentum in the fracturing force ; and I hope to be able to demonstrate to you that the third cause is the main one. It is this : the support given to the layer first struck by the layer last struck prevents the former from being fractured to the same extent as the latter, which has no such support. For instance, take a piece of slate, and knock a hole through it with a sharp pointed hammer, and the place of exit will be much larger than the place of entrance. Now, as both sides of the slate are equally brittle, we may, I think, dismiss the different degrees of brittleness without further comment.

"As regards the loss of momentum, suppose we take a piece of slate rock, of somewhat less than a quarter of an inch in thickness, and split it into three thin slates ; take two of these slates and place them in exact apposition ; strike them with the pointed hammer, with sufficient force to drive it through both ; and, of course, the slate last struck will have a larger hole than the slate first struck. But, if you now place the three slates in exact apposition, and strike them with the hammer, you will find, on examining them, that there is little or no difference between the first and second struck, because the first was supported by the second, and the second by the third ; whereas, the hole in the third will be considerably larger than the first or second, because it had no support at the point of exit.

"It is the opinion of all late writers on injuries of the head, that when small fragments of bone are driven down upon the dura mater, inflammation is almost certain to be set up and be propagated to the brain.

"The late Mr. Liston wrote, 'The presence of numerous sharp spicula of the internal table for even a short period upon the surface of the dura mater (and the more so if any of them have penetrated), is almost uniformly followed by internal inflammatory action, propagated to the brain, and its more immediate investments.'

"Mr. Prescott Hewett, in Holmes's 'System of Surgery,' says : 'But in the punctured fracture in which sharp splinters of the inner table are driven down upon or into the dura mater, inflammation almost invariably arises sooner or later ; and of all compound fractures of the skull, the punctured fracture is on this account the most dangerous, and the one which most imperatively calls for the use of the trephine.'

"Mr. Erichsen states : 'In the punctured fracture, it (the trephine) is applied, not to remove symptoms of compression which, in all probability, may not exist, but with the view of preventing inflammation, which would, to a certainty, be set up, if the splinters of the inner table were allowed to continue irritating the membranes or brain. Hence it is a rule in surgery, in all cases of punctured fracture, to apply the trephine at once, so as to prevent the injurious after consequences which must otherwise necessarily arise.'

"I need not detain you longer quoting opinions ; suffice it to say, that all modern writers express very much the same opinions. I confess, to me, it does seem somewhat remarkable that men, whose talents are so well known and appreciated—men who are occupied in the propagation of surgical science—should, one and all, express their opinion on this subject in pretty much the same words. Now, I would ask, are these opinions founded on facts ? I think you must agree with me, after having heard the history of the few cases I have read to you, that no such intense inflammatory action is likely to be set up ; and also that, unless the brain and its membranes have themselves received injury at the time of the accident, either laceration, contusion, or compression, no brain symptoms beyond what are produced by the concussion are likely to occur. In the first related case, numerous sharp spicula of bone —probably not so numerous as they afterwards became, owing to the natural process of removal wherever the fragments were surrounded by healthy granulations—lay in contact with the dura mater for the period of two years and a half ; in the second case, a year and a half ; and in the third case, a portion of the fragments were allowed to remain five weeks ; without, in either instance, exciting more inflammatory action than would have been set up in a similar injury inflicted on any other flat bones of the body. The amount of pus secreted is not more than is required for the natural process of repair. It is only, as in other parts of the body when matter is allowed to lodge and burrow between the membranes and the bone, that it becomes injurious. This I have seen exemplified in cases where there has been a comminuted fracture without a wound in the scalp. In such cases, when pus is formed, it has no outlet, and generally burrows between the dura mater and the bone, creating irreparable mischief, if the surgeon does not without delay turn the non-compound fracture into a compound one by making an incision through the integument. By thus giving exit to the pent-up matter, all symptoms of compression and injury to the brain will cease.

"I have discovered one author only who has written on injuries of the head, who appears to agree with me in believing that the brain and its membranes are not particularly prone to take on inflammatory action. This that very talented writer, and accurate observer of nature and all her efforts at repair, Sylvester O'Halloran, of Limerick, who published a work on External Injuries of the Head, in 1793, only a few years after Percival Pott published his work, wherein O'Halloran very justly blames Pott for his rash and unjustifiable abuse of the trephine. He, at the same time, calls in question the antiphlogistic treatment of injuries of the head, adopted by Mr. Pott and other previous authors, on account, as they presupposed, of a 'high tendency to irritability and inflammation in the cerebrum and its coverings.' He goes on : 'But is this supported by facts ? It undoubtedly is not. Every observation proves they have very little tendency to either ; at least, the most violent external injuries offered to them establish the fact.' Further on, he writes, 'To a certainty, then, neither the brain nor its envelopes are subject to inflammation or irritability ; at least, from external hurts.'"

In the same journal we observe some practical remarks by Mr. Haynes Walton on the importance of *Tracheotomy in Laryngitis*. He observes *apropos* of a successful case :

"I have seen life lost in laryngitis by temporising with leeches and other measures, when opening the trachea would in all probability, and according to the testimony of the *post-mortem* examination, have given a good result. In a case to which I was called, the physician in attendance overruled my opinion and my advice to operate, and death soon ensued. The healthy state of the trachea, and the œdema of the upper part only of the larynx, plainly showed the opportunity that had been lost.

"This is the light in which I regard the laryngeal affection with reference to the treatment by operation, whether the larynx is the sole seat of the inflammatory action, or participates only in that which is around and above it : it may be called a mechanical view of the matter. In the throat, as elsewhere, these inflammatory or erysipelatous attacks will and must run a certain course and pass through certain stages, however little or much they may be counteracted or modified ; and I believe in our power so to influence them, but not to arrest. When the maximum of the attack, or the highest point of intensity, does not quite produce such physical changes on the glottis by narrowing it so as to prevent the necessary amount of breathing, recovery is not, of course, prevented by suffocation. But a very little more stoppage may shut off too much air for the continuance of life, so that the issue depends on a matter of degree ; and that greater degree of inflammatory action must often be so slight, and of such kind and measure that it would not perhaps be appreciated or recognised in another part of the body, even were the affected spot under immediate observation, as on the surface. I should, therefore, always be inclined to watch more anxiously the state of the breathing, and the effect of its decline on the system, than anything else ; and to be guided by it, and to act accordingly. I should, too, be jealous in observation, lest the absence of any ordinarily expected condition, especially swelling externally or in the fauces should mislead me.

"Tracheotomy cannot cure the existing disease—certainly it cannot ; nor can any agency but the natural reparative power ; but it bridges the patient over the difficulty, and gives time, I may say life, while nature is making the cure. I say then, act in time, and do not wait till the heart is no longer able to drive the blood through the congested lungs.

"About fourteen years ago, a valuable member of our profession in London, a friend of mine, was, as I think, allowed to die after three days illness, because the physician and surgeon would not consent to tracheotomy. This gentleman begged to have it done ; he wrote his request on the slate and died pointing to his throat. The physician was rather inclined to acquiesce ; but his colleague, a very timid man, now deceased, resisted : and, as usual, life was extinct unexpectedly, while some ridiculously useless means were being tried."

We also extract the annexed remarks on the contingencies of the operation :

"There is no operation in which is to be found a greater diffe-

THE STUDENTS' NUMBER.

A new and improved GUIDE FOR STUDENTS will appear in the next week's MEDICAL CIRCULAR (September 17), containing all the information respecting the various SCHOOLS and HOSPITALS.

Orders to be sent to 20 KING WILLIAM STREET, STRAND.

THE MEDICAL CIRCULAR.

WEDNESDAY, SEPTEMBER 10, 1862.

THE ASSOCIATION ADDRESSES.

The addresses delivered at the Annual Meeting of the British Medical Association contain points worthy of remembrance. Our readers have no doubt perused those dissertations with a lively interest, and have formed their own judgment of their respective merits; nevertheless, there may be an advantage in passing them in review, so that the more striking facts and truths which they inculcate may be impressed forcibly upon the mind. These orations belong less to the Association than to the Profession at large. They are in fact, the efflorescence of professional thought and experience, the matured utterance of men who have owed nothing to the Association, either for their culture, their facts, or their principles. The attempt therefore made by the Association to monopolise their merit, to limit their circulation to its own petty sphere, to put their lighted candles under its own extinguisher, was equally mean and unjust.

The principal addresses were four in number: an introductory one by Dr. Burrows; one in medicine, by Dr. Walshe; one in surgery, by Mr. Paget; and one in physiology, by Professor Sharpey. Of the first little need be said. In it science had no voice; a profitless resumé of an old-world history usurped its place, and controversial politics, affecting the garb of liberality, enunciated dogmas which we fear that the College, represented by the speaker, has no intention to realise. So far as we can, at present, judge, these rhetorical proclamations of corporate unity and professional equality, had in them little faithful meaning, and if read by the aid of the gloss recently supplied in the new regulations for the licence of the College of Physicians, they were not intended to embrace the great body of future licentiates. Dr. Burrows as an influential member of the College has, in city phrase, discounted his own professions so largely, that they have but a small current value.

Dr. Walshe's address was of a different type; imaginative, eloquent, and comprehensive, but diffuse, redundant, and digressive. Still it was a sparkle of genius, the upshot of no common mind, an intellectual effort that any man might be proud to own, and few could afford to deride. There is among us, when we meet in public, one weakness that should be corrected—we flatter each other too extravagantly. The encomiums were cast so thick and sudden into the face of Dr. Walshe, that he could hardly get his breath, and, although he was no doubt very happy, he looked painfully diffident of his own deserts. It was not, however, he only who was made shamfaced; everybody was belauded; for each speaker tried to lighten the burden of the panegyrics heaped upon himself, by lavishing them in return upon somebody else. We mention this, because we cannot deal out our eulogies with equal liberality; besides, the same obligation does not rest upon us to be grateful.

Dr. Walshe enforced on the seeker after truth the duty of collecting facts, and of discarding *à priori* principles. He was subsequently called to account by Dr. Bennett for this rigorous teaching, and the latter speaker very fairly showed the value of a proper appreciation of principle in conducting medical researches. The debates recognised the difference between the inductive and the deductive modes of prosecuting scientific inquiries—a bit of scholasticism interpolated into the proceedings, not very profitable, nor altogether barren. As a practical experimentalist, Dr. Walshe was right; as a speculative thinker, Dr. Bennett was right also. Facts teach nothing of themselves though they be piled high as Olympus; it is the mind toiling among them, thinking about them, collecting, assorting, and arranging them around some preconceived principle that gives them significance. How the mind took the hint of its new principle, it cannot always explain, even to itself; sometimes from an incident of the facts, sometimes from a stray radiation from its own inner light, sometimes from an external suggestion, sometimes borrowed and allowed, sometimes stolen. However, it came into the mind; once there, as an hypothesis, it becomes the test of the evidence of the facts, the electric wire around which they must crystallise. On the other hand, without facts, hypothesis is a snare and a cheat, and has done more than any other thing to fill the path of the honest inquirer with thorns and ruts. We may add, however, that no truth in medicine will ever be established by a process purely deductive; the final appeal must be to facts. The man who will make the most extraordinary advances is he who can conceive most profoundly and observe most accurately. It is perfectly idle to expect any man to make great discoveries in science with the use only of half his faculties. The dispute, therefore, between these learned gentlemen was little to the purpose.

The address by Mr. Paget was replete with sound instruction, based upon a philosophical insight into the forces of the animal economy. It was in every respect a remarkable oration. What did he teach us? Virtually that Nature was the best surgeon, and after her the man who understood her ways and walked closely in them. He undervalued extreme theories of treatment; he had seen patients treated with brandy and get well; others treated with abstinence, and get well also, and this result he attributed "to the natural tendency to recovery—a tendency generally so certain that neither surfeit nor starvation could avert it." There has seldom been so emphatic a testimony borne to the restorative powers of Nature as in these words by Mr. Paget. True, it is an old doctrine, but it is only in modern days that it has been so intelligently comprehended. Mr. Paget, therefore, is averse to meddlesomeness in surgery, and enjoins such assistance to be given to the natural powers as will enable them to work under the most favourable conditions—in two words, he enforces "repose and cleanliness." Mr. Hilton has recently delivered a series of valuable lectures on "Rest," and proved that formidable diseases can be cured by "rest" as a main agent. Mr. Paget endorses this teaching, and, adding "cleanliness," has given us the Alpha and Omega of modern scientific surgery.

We must now add a few words on Professor Sharpey's discourse on physiology—so copious, so elaborate, so discriminative, so judicious, that we can hardly praise it too much, or

qualify it according to its deserts. The Professor surveyed the entire realm of physiology, made us acquainted, in words clear and brief, with the most recent discoveries in the abstrusest departments of this study, and worthily concluded these orations with a series of reflections on the nature of the life-forces, and the mysterious conditions of organisation and development, that are not more honourable to his profound knowledge and critical sagacity than to his fine moral feeling and philosophical liberality.

VIVISECTION.

The cruelties perpetrated at the Veterinary College at Alfort have raised the question of the necessity of resorting to vivisection at any time for scientific purposes. An international congress of benevolent persons has recently been held in London for the discussion of this question. It was attended by several medical men; among the rest, Mr. Macilwain, Dr. Fraser, Dr. Kidd, Dr. Tunstall, of Bath, and Mr. B. Travers; whilst communications on the subject were read from Dr. Elliotson and Dr. Richardson. Mr. Macilwain and Dr. Fraser denounced vivisections without exception. The former gentleman broadly asserted that a resort to them had never advanced medical science, and vindicated the memory of John Hunter from the discredit of being a frequent vivisector. Although Hunter had resorted to vivisection, yet Mr. Macilwain denied that he had derived any advantage from such investigations. He had, moreover, expressed a strong opinion against their utility. It is certain that the most remarkable characteristic of John Hunter's works is the keen sagacity exhibited in forming conclusions from simple observations. The circulation of the blood was a discovery not referrable to vivisection. Dr. Fraser affirmed that Sir Charles Bell was opposed to vivisection, and thought that it was quite as likely to mislead as to assist the student.

We have no doubt that vivisections are chiefly performed by a class of philosophers who never make any discoveries—people more hasty and inquisitive than thoughtful. All that vivisections teach might be learned by a careful observation of disease, but as it unfortunately happens that the observation of disease is a slow, protracted, and wearying process, and that the facts from which conclusions must be drawn occur at long intervals, and, therefore, lose much of their value as elements of comparison, inquirers are prone to resort to the summary method of vivisection, by which a large number of facts may be collected and compared in a short time. We would not discountenance vivisections altogether, especially since the introduction of chloroform has banished pain, but we should decidedly discourage a frequent and unnecessary resort to such operations. The conclusions derived from the observation of morbid phenomena are more reliable than those from vivisection. The latter, indeed, are never trustworthy alone, although, no doubt, evidence from both sources "makes assurance doubly sure," more particularly in determining the functions of the various parts of the nervous system. It is not a propensity of English physiologists to resort to vivisection, and they are not so blameable in this respect as our professional friends across the Channel. The stories told of Majendie and Brachet are simply horrible. Such barbarous tales narrated of Englishmen would ruin them in society; we are not, therefore, under any apprehension that the practice of vivisection will be abused in this country.

SUMMARY OF THE WEEK.

THE USE OF A MEDICAL COUNCIL.

The Scotch Corporations are so indignant with the English College of Surgeons for having set at nought the recommendations of the Medical Council, that they have determined to have their revenge by acting with equal contempt of Court. For "the present," they snap their fingers at the Medical Council, and intend to have things their own way. The Colleges of Physicians and Surgeons of Edinburgh, and the Glasgow Faculty, will admit candidates for examination after three winter and two summer sessions, and will allow registration without any previous examination in general education! So much for virtue! So much for the Medical Act! So much for fraternity! So much for the conciliating influences of the Medical Council! What do the Irish Corporations mean to do? Their representatives voted with the College of Surgeons; so, perhaps, they are satisfied with their victory. This is a lamentable state of things, and is the commencement, we fear, of a break-up of the Medical Council. It is quite time that the Profession should step in and make the government acquainted with their own views and wishes in this matter.

THE NEW POOR-LAW AMENDMENT ACT FOR IRELAND.

This Act contains some important clauses in relation to the Medical treatment of the poor, which deserves attention. There is a power given in it to guardians, to send any cases requiring Medical or surgical treatment into the Workhouse *Hospital*, without requiring the removal of any other members of the family. We allude to this power because it creates a *bonâ-fide* hospital in every District. In this country there are no actual workhouse hospitals. Chronic cases and aged persons alone are received, as a rule, and the acute and severe cases are provided for at the homes of the sufferers, or in Borough and County Infirmaries. The sick wards of our English Union Houses should be made *bonâ-fide* hospitals, and every pauper labouring under severe medical or surgical disease should be admitted. There is another clause in the Act which requires poor persons admitted into hospital, to contribute to the expense of maintenance, when they can afford to do so. This is also a prudent clause. Poor persons thus contributing to their own maintenance will not be disfranchised. Should this act be carried out in a frank spirit, the condition of the poor in Ireland will be far better provided for than is the case in this country.

INTERMARRIAGES.

This subject has been occupying the attention of our contemporaries for some time past, and evidence on both sides, and from all quarters, has been adduced. Is intermarriage wrong—of course, we mean physically—*per se*. If so, how? We have not seen a satisfactory answer in the affirmative of this question. Dicta are plentiful, but evidence is wanting.

Breeding in and in may be either advantageous or injurious, according as the original stock be healthy or diseased. In the latter case, the injury is not from the intermarriage, but from the disease. In other words, intermarriage does not induce degeneracy in a healthy stock. We are told, however, that the Spanish grandees became, through intermarriage, the smallest sized and most wretched looking creatures in Europe; but was this the result solely of intermarriage as a degenerating influence? There is a tendency in personal peculiarities or idiosyncrasies to perpetuate themselves; marriage in and in, therefore, intensifies these peculiarities in different families.

If the qualities for which a family be remarkable are associated with a healthy organisation, the type is improved; if the contrary, it degenerates and dies out. Here is the real danger of intermarriage; so that practically it is well to be cautious in encouraging intermarriages.

VEGETARIANISM.

The followers of this creed have held their fifteenth annual meeting at the Crystal Palace, where they enjoyed themselves over a dinner of herbs, rolls and butter, apples, pears, plums and lettuces, with tea and coffee as stimulating beverages. The fact having been ascertained, that during the privations at Preston the mortality had decreased, the Committee attributed this immunity from disease to the circumstance that the people were so poor that they were unable to buy animal food. A Dr. Trall, of New York, who was present, declared that he was a vegetarian, and that he never gave any physic, nevertheless his house was always full of patients—rather an unfortunate testimony to the sanitary virtues of a vegetable diet. The progress of physiological science has proved to us the possibility of life being preserved by purely vegetable aliment; we know it as a matter of science, we know it as a matter of fact. A vegetarian, however, must eat an enormous quantity of food to get an amount of nourishment equivalent to that obtained from a similar quantity of animal aliment. The Irish labourer is one of the stock illustrations of the vegetarians; it is true that he labours hard upon a scanty diet, but it is not true that, in this country at least, he enjoys good bodily health. In Ireland, where the people live chiefly upon potatoes, they eat immense quantities of them—quantities, indeed, that would astonish an Englishman accustomed to a different diet. The Vegetarians are, no doubt, innocent people, and we wish them all very good health. There is no harm, we hope, in drinking to it in a glass of hot punch, the components of which are all derived from the vegetable world.

THE FATE OF AVARICE.

A man of the name of Woollaston, having come into considerable property by the bequest of an uncle, gave himself up to a life of miserable penuriousness, taking a lodging at the east end of London, and depriving himself of almost all the necessaries of life. At last he was taken ill, and his face began to swell; his neighbours advised him to call in a surgeon, but he repelled their counsel with the remark that "no doctor should ever touch a penny of his money." The result was that the abscess eat its way into an artery, hæmorrhage occurred, and the miserable man died a victim of his own parsimony. It is probable that the man was a lunatic, and it would have been a mercy if his friends had placed him under proper supervision.

CHOLERA was raging at Peshawur at the latest date among Europeans and natives; it was also spreading at the north-west provinces. At Shanghai the disease has been prevalent, but according to the latest advices was abating, although the weather is reported to be fearfully hot.

THE ATMOSPHERE AND THE CIRCULATION OF THE BLOOD.—Dr. Wanner has communicated to the French Academy an abstract of experiments tending to prove that the atmospheric pressure is indispensable to the circulation of the blood.

AFFECTIONS OF THE THROAT IN SCOTLAND.—Sore-throat, ulcerated sore-throat, and diphtheria, have occurred in various localities in Scotland, and in Mid and South Yell. The sore-throat appears to have been accompanied with an affection of the hands, which raises the suspicion that sore-throat and diphtheria in the human subject is but a variety of the epidemic disease in cattle known by the name of murrain or ipizootic-aphtha, characterised by the aphthous and ulcerated mouth and sore hoofs.

REVIEW OF THE PERIODICALS.

(Continued from page 187.)

rence in execution between the living subject and the dead. In the latter, the trachea is prominent, and stands out, as it were, high and dry, no longer surrounded by full blood-vessels, and away from the shrunken muscles; in the former it is deep, covered, and astonishingly hidden by the acting muscles, and always seems smaller than one would expect, and more difficult to expose. It is quite impossible to give an accurate idea of the great dissimilarity of the proceeding, arising out of these conditions. The difference is still widened when there is swelling of the neck. In a case to which I was called to perform tracheotomy for diphtheria last year, in the person of a young adult, by Mr. Beale, there was, in addition to a very fat neck, so much swelling of the integuments, and so much infiltration of the neck-muscles, that for a time it seemed impossible that I should ever expose the trachea satisfactorily. The difficulty was increased by the very profuse bleeding. Except for the quiet behaviour of the patient, I could not have succeeded.

Tracheotomy in children is very strikingly more difficult than in adults, on account of the diminutiveness of the parts, especially in the lesser size of the trachea, and its comparatively greater depth, and the granular fat and small veins that lie on it.

"It is more easy to open the trachea, as I did in this instance, above the isthmus of the thyroid body, than below, because of the more superficial position and the absence of veins. Except when the thyroid body is diseased, or tracheotomy is needed for the extraction of a foreign body, this position should be preferred. Ordinarily, the isthmus covers the third and fourth tracheal rings; but it is uncertain in size and shape. The objections to the lower operation are, the greater depth to traverse, the presence of the inferior thyroid veins, and of the sterno-hyoid and thyroid muscles, which, in a thick-set muscular man, overlap the air-tube more than could be supposed from what is seen in the dissections of bodies. On the lower portion of the trachea exist branches from the inferior thyroid arteries. The carotids are, of course, in nearer relation, the lower the operation is done.

"There is no more important step in the whole proceeding than that of dividing the integuments exactly in the mesial line. It is the first thing to be done; and, if badly done, unfortunate results are likely to follow: the lateral lobe of the thyroid might be cut into, or the trachea missed, or perhaps the carotid artery opened. I have seen the first and second happen.

"I am particularly desirous to speak about hæmorrhage. Indeed, to get an opportunity for this has originated these remarks. Except under the most urgent haste, and when life seems to depend on the immediate and momentary admission of air to the lungs, should the trachea be opened while its surface is covered with blood? Several times I have seen death produced by the blood being inspired; and in each case, unfortunately, there was no hurry needed. In one of these, an extraneous substance was lodged in the larynx. An excellent surgeon, who, when he found that he could not control the bleeding by any ordinary measures, applied the actual cautery. Success ensued. I am sure that the patient is always placed in the greatest possible danger, except the bleeding be arrested or almost checked.

"I think that the trachea should invariably be hooked up and steadied before being opened, because of the greater accuracy secured, and the dangers that are avoided, and the time that is saved. This is recommended by all good practical surgeons who have written on the operation, and no doubt practised by most judicious operators; but, strange to tell, it has never happened to me to see it used in the many times that I have witnessed tracheotomy.

We remark in the same journal the following testimony in favour of *Teale's Mode of Operating in Amputations*, by Mr. WHIPPLE, of Plymouth:

"Having touched thus lightly on excision, I would pass on to amputations, after Teale's plan; of which we have had a large number. The stumps are all perfect in symmetry and usefulness, and with a great advantage over every other form, particularly for the young operator. You can set about the operation with mathematical precision, so that the young surgeon's first amputation is as secure of a perfect stump as that of the most experienced and self-possessed practitioner. The detail you all know; and the measurements made, no mistake can take place. I strongly press it on the beginner. I cannot say I like it for the matured operator. The tape in hand I do not approve; and (vanity! vanity!) I prefer a modification of my own. It is a compound operation—half the old flap, half Teale's. I transfix the limb with a catline anteriorly, carrying it as far as my judgment points out, and then cut it out at nearly right angles. I again transfix posteriorly, carrying my knife only half the length of the anterior flap, and cut it out also at right angles. Then my assistant holds back the flaps, which enables me to pass my knife round the bone; I then apply the saw. The

operation is expeditious ; and the flaps meet very neatly ; certainly not so exactly as Teale's, but by the time the cure is perfected very little difference is seen.

"The great advantage of Teale's method, in fact, is the abolition of any application but water-dressing."

The 'Medical Times and Gazette.' DR. SOELBERG WELLS commences in this number a series of Lectures on *Diseases of the Eye* The present Lecture treats of the theory of squinting. The author says, it is necessary to understand the theory before an operation is attempted ; he, therefore, enlarges on the optical theory of squinting, and had it been comprehensible without the diagrams to illustrate it, we should have been happy to reproduce it : as it is not, we refer our readers to the original article. DR. WHITEHEAD contributes *Notes on Causes of Mortality*, which are very elaborate. We make a few quotations :

OF THE EXISTING POPULATION.—PROPORTIONS OF THE SEXES.

"The results of statistical inquiries into the condition of the people inhabiting this quarter of the globe, during the last sixty or eighty years, have revealed the fact, that the numerical relations of the male and female sex stand in an unequal proportion to each other, and that the excess is constantly on one and the same side. For the aggregate of the several European populations, systematically investigated, the results have been nearly the same, according to the different censuses, since the commencement of the present century. In the several constituent communities, however, deviations in one or other direction are constantly observable, the disparity lessening in one state and become wider in another, although, apparently, in a compensatory sense merely, as the general issue has continued to be almost unvarying.

"In one state only, and that very insignificant as to numbers, has the male element been found in excess of the female,—a circumstance sufficiently accounted for by an unusual immigration of males during a season of political agitation in the neighbouring States.

"The aggregate population of central Europe, comprising France, the Germanic Confederation, Norway, Sweden, Belgium, and the Netherlands, amounted, in 1842, to somewhat more than 101 millions, of which number 49,874,097 were males, and 51,296,858 females, giving an average proportion of 102·8 females to 100 males. For Russia, however, the disparity is considerably lower. With a population, in 1842, of 49½ millions, the proportion of the sexes stood at 101·2 females to 100 males. This lower estimate may appear singular when it is taken into consideration, that the proportion of male as compared with female births in Russia was, in that year, and seems to be so generally, far higher than in any other European country. The circumstance may possibly be accounted for on the supposition, that the mortality of adult women in Russia is more or less augmented by the hardships to which the female portion of the serf population are said to be exposed in their maternal trials, and the laborious employments in which they participate with the men. Taking these two groups together, comprising a population of 151 millions (in 1842), the average proportion stood at 102 females to 100 males.

"For the following principal states taken together, Portugal, France, England, Belgium, Switzerland, Prussia, Austria, Saxony, Wurtemberg, Bavaria, Hanover, Denmark, Sweden, and Norway, the mean relative average of the two sexes in 1851 was 101·57 females to 100 males. The extreme variation, amounting to 6·87, was represented by Prussia (the lowest), where it stood at 100·12, and Sweden (the highest), 106·99 to 100 respectively : the numerical superiority of the female sex being lower in Prussia and higher in Sweden than in any other of the countries above enumerated. The only European State wherein the male exceeded the female element was Sardinia (Piedmont included), the proportion being 99·04 females to 100 males. That this assumed predominance of the male sex is not attributable to any error in the operations, is proved by the fact that the same results accrued in two successive recensions ; neither is it due to any exceptional excess of male births, nor yet to a high rate of female mortality. The phenomenon seems to be reasonably attributable to an inordinate influx of males into the Sardinian States during the preceding few years.

"These fluctuations are materially affected by a number of influences to which all communities are more or less exposed, such as external political relations sometimes necessitating the rapid absorption of men into the military and naval services, the extent of the emigration movement, the prevalence of epidemics, and other causes. But neither of these agencies can have operated in the production of the notable change of relations which has taken place in the French population during the first half of the present century—or more strictly speaking, during the thirty years ending with 1851. For, although the military drain in that period has perhaps been greater in France than in any other European country in the same space of time, and with the emigration movement, which always engages more largely the male than the female, somewhat on the increase ; yet has the female element been steadily, though slowly, decreasing from the beginning of the century, with the exception of a temporary rise in 1821, to the publication of the Report for 1851.

Again :—

"In the large towns and densely-peopled districts of France and England, as well as those of Austria, Prussia, etc., with a few exceptions, the numerical superiority of the female sex seems to be the rule. For although the contrary obtains in the principal towns of Russia, and the same thing to a trifling degree in Berlin and Rome, the female preponderates in Naples, Florence, Brussels, Vienna, Paris, London, and Stockholm. Marseilles has an excess of the male element ; but at Lyons, Bordeaux, Lille, and Rouen, the general rule prevails. These differences are due to purely local circumstances, amongst which may be mentioned certain branches of trade employing much more largely the male than the female ; and *vice versâ*, public establishments for the education of males, the erection of extensive public works, considerable military garrisons, etc. Another cause of disproportion may be found in the influx of females into large towns from the agricultural districts in search of domestic and other kinds of employment ; while a principal reason of the extraordinary male preponderance in St. Petersburg and Moscow is manifestly owing to the custom which prevails among all ranks of society in Russia, of employing males exclusively as domestic servants. The rigour of the climate, moreover, prevents the migration of any but males, except during the few brief months of summer.

"Of the numerical predominance of the female sex, however, among the dense, as compared with the sparsely disposed, masses of Central Europe there can be no doubt. For example:—The mean average proportions of the Austrian population are 104·50 females to 100 males ; but for Austria Proper, containing Vienna and other large towns and districts, densely peopled in comparison of the rest of the Empire, they stand at 108·12 to 100. And for Paris, for the forty years ending 1856, the female element is represented by 102·88, while that for the whole of France stands at 101·08 in 1851, and 102·10 in 1856.

"In the following table, representing the relations of the sexes from the several registration divisions of England, ranged in the order of excess, the same tendency (that of a higher female preponderance, namely, as a condition of agglomeration) is also observable :—

To 100 *Males.*

Divisions.	Females.
London	113·60
South Western	108·15
North Western	104·44
Northern	104·36
Eastern	104·29
Western	102·93
South Midland	102·50
South Eastern	102·27
North Midland	102·01
York	101·86
Welsh	101·77
Mean	104·40

"In reference to the question now under consideration, two items in the preceding table seem to require a word of explanation. First, the high figure (108·15) which represents the proportion of females in the South-Western division (chiefly agricultural), would appear to stand in contradiction of the rule assumed. But this apparent anomaly may possibly be accounted for by the fact, that the South-Western district contains a considerable number of places resorted to by invalids and retired families, all employing a large amount of female service. Such localities are to be found on the coasts of Dorsetshire, Devonshire, Cornwall, and Somersetshire, sought by multitudes from all quarters on account of the mildness of the climate and salubrity of the atmosphere ; as well also as Bath and other inland places in no trifling degree dependent, commercially speaking, upon the presence of strangers of the class mentioned. In the second place, the York division (largely engaged in manufacturing processes), on account of the low item (1·86) representing the preponderance of its female element, may also be objected to. But the densely-crowded part of Yorkshire is limited to a portion of the West Riding, while the rest of this extensive county is chiefly agricultural. Were the relations of the sexes for Leeds, Bradford, Sheffield, Halifax, and Huddersfield, with the adjacent and intermediate towns of smaller size to be ascertained, it is probable they would present a striking contrast with those of the rest of the division.

"The actual relative proportion of the sexes of the five principal countries of Europe in 1856, after Tegoborski, stand as follows:—

Countries.	Population.	Females to 100 Males.
Austria . . .	38,000,000	104·5
Prussia . . .	16,000,000	100·4
France . . .	36,000,000	102·1
Russia . . .	68,000,000	102·1
England . . .	27,000,000	104·9
Aggregate population .	185,000,000 Mean .	102·8

Dr. Wm. Cooke communicates a paper on *Diphtheria*. He reports in detail four cases of great severity, and adverts to two other milder cases, all in one family, of whom three died. The infection was brought into the family by a little son, who had taken the disease at school. Some cases of *Craniotomy* are reported in the same journal by Dr. Ramsbotham. We extract a few:

"*Case* 135.—On July 25th, 1843, at 3.30 p.m., I was sent for by one of the parish Surgeons to a patient in Wapping Workhouse, in labour of her first child. The membranes broke about twenty hours before, and the uterus had been acting very strongly ever since; yet its mouth was not dilated more than to the size of a crown piece, and was thick and rigid, while the pelvis in its conjugate diameter at the brim did not possess a greater space than two and a-half inches. The head was entirely above the brim, and the left foot was in the vagina. I passed a piece of wide tape with a running noose easily over the ankle, hoping to make the child revolve, and to extract it feet foremost. But, notwithstanding, I used as much traction as I thought the leg would bear,—for putrefaction had commenced in the child's body,—I could not succeed in bringing down the breech, partly, perhaps in consequence of the small size of the pelvis, but chiefly owing to the tonic contraction of the uterus, which had firmly embraced the fœtal body. I therefore perforated the head, and extracted with the crotchet. The operation required much exertion, and occupied fully an hour; the placenta passed naturally. Next day the woman had passed water freely, and was as well as if she had gone through an ordinary labour. She recovered satisfactorily.

"*Case* 139.—On December 26, 1844, at 3.30 p.m., I was requested by a Medical friend to visit Mrs. C., Bucklersbury, aged thirty-seven, in labour of her first child. Pains commenced early on the morning before, and she went on well through the day and night. The membranes broke about midnight, and the uterus began to act with much vigour. Still the head remained above the pelvic brim, which was not wider in the conjugate diameter than 3⅛ inches. The pains continued very powerful; about 11 a.m. she became very restless, and could not be controlled, and at 2 p.m. was seized with a violent convulsion. She was bled to sixteen ounces; and at 3 she had another fit, and was again bled to the same amount. My friend then tried to deliver her by the forceps, failed in doing so, and sent to me. I found her very much exhausted, in a state of partial coma, from which she could be roused to answer questions, but she immediately relapsed into insensibility. The funis was prolapsed, not pulsating. The pains had quite ceased since the second fit. As there could be no doubt about the child's death I perforated the head immediately, and delivered in half an hour by the crotchet. There was no return of convulsions after delivery. She gradually recovered her consciousness; and I saw her on the 30th, when she was convalescent. On September 17, 1846, I was consulted about her, in consequence of pregnancy, and I recommended that labour should be induced prematurely.

"*Case* 140.—On the same day, December 26, 1844, at 10.30 p.m., at the request of a Professional friend, I saw Mrs. W., Hatton garden, aged thirty-two, in labour of her first child. The membranes broke thirty hours before; the head was in the pelvis very much compressed and elongated, producing great pressure on all the structures in the cavity; the pelvis was narrow throughout. The pains had been very violent after the membranes broke; but had now ceased entirely; there had been no advance in the head for twelve hours; and the child's body emitted a most offensive putrid odour. The woman was very much depressed both in mind and body, so that I had but very little expectation of her recovery. I introduced the catheter with great difficulty, owing to the pressure produced by the head, perforated the skull, and extracted easily in about fifteen minutes by the crotchet. She rallied wonderfully and recovered, but five days after delivery the urine passed involuntarily; a slough took place at the neck of the bladder, for which, I believe, she sought Surgical assistance after she recovered from her confinement.

"N.B.—I have already remarked that in almost all the cases which I have seen of slough taking place at the neck of the bladder, the child's body has been in a highly putrid condition. I therefore attribute the disorganisation to long-continued contact with the putrid head, and consequent absorption of putrid matter as the predisposing cause; and to uninterrupted pressure for a lengthened period as the immediately exciting cause.

"Besides the case previously detailed, in which I delivered by craniotomy, the head presenting, under hæmorrhage, and the three cases, also already given, in which I perforated behind the ear after the body was born, when turning had been accomplished under *placenta prævia*; it will be observed that during the five years embraced between January 1, 1840, and December 31, 1844, I delivered thirty-two women by means of the crotchet, which instrument I always use because I regard it as much more efficacious and much less dangerous than any kind of "craniotomy forceps" that I have yet seen. In two of these cases the face presented. Two were complicated with convulsions. In one the head and a foot presented at the pelvic brim. One was the first child of twins. In one the cause of delay was pelvic tumour. In two the fœtus was hydrokephalic. In one a slough took place from long-continued pressure, contracting the vagina, the bladder being uninjured. In two, fistulous orifices occurred in the neck of the bladder, both fœtuses being highly putrid. Only one woman died,—one of the cases of hydrokephalus,—she had been in labour between four and five days, and was moribund when delivered.

"Those difficult breech presentations and transverse cases, which occurred to me between January 1, 1840, and December 31, 1844, will occupy the next series of these reports."

The 'Lancet.' The lectures on *Pain* by Mr. Hilton are continued in this journal. The following case is an instructive one:—

"*Case of diseased hip joint, with necrosis of acetabulum, cured by 'rest.'*—The next case of hip-joint disease is one complicated with disease of the acetabulum; and that is its great feature:—A delicate, pale, unhealthy-looking young gentleman, aged fifteen, in the spring of 1846, after taking a long walk, suffered excessive pain and some swelling in his right hip-joint. He was then in Edinburgh, and was kept in bed, by his surgeon's advice, during three months, his thigh being strapped up with some irritating plaster spread upon leather. Slowly recovering from this attack, he continued well until August, 1847, when over-exertion brought on his hip-joint symptoms again more severely than in 1846, and he remained at home in London, under the care of an hospital surgeon, alternately keeping and quitting his bed at short intervals, so that the joint had not the advantage of continued rest, until the end of 1847, when, notwithstanding numerous leeches, lotions, strong counter-irritants, and abundance of medicine, all his hip-joint symptoms became much worse. As to leeches, he said to me, "I have had upwards of 1,200 applied to my hip in the course of a few months!" The loss of blood by 1,200 leeches may be estimated at about 300 ounces. This is pretty well for a delicate lad suffering from hip-joint disease. He told me that he had taken pailsful of horrid medicine. The loss of blood, the physic, and the counter-irritation reduced his strength, and brought on loss of appetite, want of sleep, with jumping and starting pains in the limb, to such an extent that he was compelled from unmitigated exhaustion to fall flat upon his back, and there remain uninterruptedly at rest upon his bed; and from that time he began to improve in every respect.

"Here, then, was a case of 'forced rest' against the judgment and discretion of the medical attendants—forced rest compelled by direct feebleness on the part of nature; and from that time the patient began to improve. He continued in bed until the summer of 1849—nearly eighteen months. The blistering and counter-irritants that were applied were, according to his own account, something awful. Even when exhausted in bed his surgeon would not let him alone, but still applied blisters, setons and counter-irritants. A large abscess made its appearance in the spring of 1849 just above Poupart's ligament, near the anterior superior spinous process of the ilium. The skin was allowed to ulcerate, and the discharge was immense, and was dashed out of the opening by coughing or sneezing, or by taking a full breath, indicating intimate association of the abscess with the interior of the abdomen and pelvis.

I first saw this patient in the autumn of 1849, lying on his bed, not pale, but transparently white, like alabaster (I never saw a man so transparently white—translucent almost—as he was), thoroughly exsanguine, and exceedingly emaciated. Abundance of thin pus was escaping from two sinuses—one at the upper and inner side of the thigh, and the other, before alluded to, close to Poupart's ligament. Through the opening of this latter abscess I passed a long probe into the pelvis, behind the acetabulum, and there felt necrosed or carious bone. The discharge from this abscess occurred most abundantly during the effort to evacuate the bowels, when it would gush out. There was scarcely any pain in the hip-joint. I ascertained by careful but painless examination, although he was in great fear the whole time, that the thigh-bone and the anterior part of the acetabulum were firmly united; the limb was in good position, except that the foot was a little too much everted. Seeing no advantage in his lying any longer in bed, he was daily dressed,

laid upon a couch, and as soon as the weather and his own extreme feebleness permitted, he was taken out of doors into the garden, lying there all day upon the couch.

"In the spring of 1850, he passed nearly all his time out of doors, sitting in a Bath chair in the garden, or being dragged about in a small hand-carriage. From the time of my first visit he left off all medicine, except cod-liver oil and steel wine, and took porter, wine, meat, &c., in abundance. In 1851, amongst other efforts, he went to the Exhibition, resting on his crutches: and in 1852, he was employed in a public office, where he has been constantly occupied ever since.

"March 21st, 1861, he called on me in good health, well covered with firm flesh. He belongs to a rifle corps, goes through the drill, and can walk ten or twelve miles without pain; but the exertion of walking beyond that distance brings on fatigue, which he attributes to his stiff hip-joint. Several small portions of cancellated bony structure have been extruded from the upper abscess at three or four different times, but none during the last four years. The sinus from the intra-pelvic abscess does not remain closed for more than three or four months at a time, when a little pain and fulness occur under the closed aperture. This soon opens of itself, or he himself opens it. About a teaspoonful of pus escapes, and in a day or two nothing but a thin, watery fluid oozes out, and then it remains closed during another three or four months. He walks somewhat lame, dipping the pelvis a little to the lame side when he touches the ground with the foot of that leg. Standing upright upon the sound leg, the heel of the lame side is about an inch and a half or two inches from the ground. The head of the femur is in this case a little anterior in position to where it ought to be. That explains the slight fulness below Poupart's ligament, which impedes the easy return of the blood, and produces a varicose condition of his superficial veins. The muscles of the damaged leg are exceedingly well developed, but not quite so much so as in the sound side.

"I think I might fairly refer to this case as one of diseased hip-joint, complicated with disease of the acetabulum, not placed under very favourable circumstances as regards professional treatment, and, consequently, not as regards rest; yet in spite of that, so strong have been the energetic efforts made by nature, that the patient is, in his actual condition, happy and comfortable, equal to all the duties of his office, capable of taking exercise, and able to form part of the defensive corps against any encroachment upon his country."

We also extract the annexed observations:

"I desire, before quitting this subject, to repeat the expression of my surprise and regret that some surgeons should continue to make their diagnosis of hip-joint disease depend on the recognition of what may be fairly denominated the 'outlying symptoms' of that disease; for I cannot conceive the reason why surgeons should not go directly and promptly to the hip-joint itself, and examine that part with care. I am confident that if the same method of proceeding to diagnose hip-joint disease was adopted as is usually followed out for the purpose of detecting disease about the knee, ankle, shoulder, and other joints, much of the doubt which still hangs over these (sometimes obscure) hip-joint cases, especially in their early stage, would disappear. It is because surgeons will depend on the outlying symptoms for their diagnosis, and not upon the actual positive inflammatory or abnormal or painful condition at the hip-joint itself, that mistakes so frequently occur.

"There are numerous cases simulating hip-joint disease, some of which may be improved by 'rest,' and some deriving no benefit from that method of cure. Thus we often meet with lameness in children, in one or both of the lower extremities, in which the local symptoms somewhat resemble hip-joint disease, although the pathological cause will be found in the brain or in the spinal marrow. In such cases, although the patient is lame, there is no general febrile state, except when teething coexists, nor is there any evidence of local heat, or pain or tenderness in the hip-joint itself. The limb is not flexed or adducted, nor is there usually any distinct pain when the patient walks, which he does limping a great deal; but it is unaccompanied by the peevish anxiety which usually attends the existence of hip disease: in fact, the positive symptoms of hip disease are not well marked.

"In these cerebral or spinal cases, the limb usually becomes feeble or wastes before or coincidently with the lameness and the defect in accurate progression. The movements of the limb can be accomplished through the will, but they are exceedingly ill-defined, so that there is great want of precision and accuracy in the step. The limb seems as if it were simply suspended from the pelvis; and obeying gravitation, as well as an imperfect volition, it swings loosely as if partially paralysed. The limb is usually colder than the corresponding one on the other side. Even in such a case, if any doubt exists as to the real cause of the lameness, it is better to apply a splint to the limb, and keep the patient in bed for a month or six weeks; if, at the expiration of that time, there be no improvement, and other symptoms seem to indicate brain or spinal marrow affection, the patient will have lost but a short period of time; the treatment in reference to the brain and spinal marrow might be going on at the same time that 'rest' is secured to the limb in reference to the probability of anything wrong at the hip-joint.

Three or four years ago, I was requested to see a case of this kind in consultation with Mr. Frederick Toulmin, of Hackney. I thought I recognised a slightly increased temperature at the hip-joint, and some pain there on pressure. These local symptoms might have originated in the attempts made on the part of this boy to take exercise when his limb was in part paralysed. He kept a long straight splint on six weeks, chiefly by my advice; it turned out that it did no good, but certainly it did him no harm. He was afterwards treated for cerebral disturbance, and he ultimately got well. Still I hold that, in cases admitting of doubt, it is better to have the splint applied; for if in this case an error had been committed, or any omission made, hip-joint disease might have gone on to some considerable extent."

Mr. Hilton records other most interesting cases, accompanied with valuable practical remarks.

Mr. Hancock continues his observations on *Division of the Ciliary Muscle*, and reports a series of cases in illustration of its value.

The following case of *Rupture of the Heart* is reported in the same Journal, by Mr. Edgar Lowe:

"Rupture of the heart so seldom occurs without some ascertainable cause, that I think the following case, which lately came under my notice, may be of interest to the readers of 'The Lancet:'

"Richard S——, an agricultural labourer, aged sixty-five, (residing at Orleton, a very hilly part of the county,) of temperate and regular habits, had always enjoyed good health, except an occasional winter cough. On Monday, the 4th of August, he returned from his work as usual, and, according to the evidence of his wife, expressed himself as "never better in his life." They went to bed at their usual time, about half-past nine, and at four the next morning she was awoke by him calling to her. He was sitting up in bed, and complained of acute pain in the right side of the chest, and asked her to make him a cup of tea. She got up to do so, and he then said a pipe of tobacco would do him more good. She ran down stairs directly, brought up the pipe, when he placed both hands on his chest, said "Oh, God! I'm choking," fell back into her arms, and died.

"I received an order from the Coroner to make a post-mortem examination, and did so on the 9th, four days after death. Externally, the chest, neck, and lips were livid. No appearance of blow or injury of any kind. On opening the cavity of the thorax, I found the lungs perfectly healthy, and free from pleuritic adhesions, but the pericardium much distended. This I opened carefully, and found completely filled with dark, semi-coagulated blood. I then examined the heart, and found that the muscular structure had given way in two places near the base of the right ventricle. One was a jagged opening of about a quarter of an inch in length, and the other close to it, but smaller. The walls of both ventricles were to some slight extent thinner than usual; but the heart was of the normal size. No fatty degeneration, valvular disease, or deposit of ossific matter. I could not ascertain that he had ever suffered from any accident.

"This, then, is a case where, although the cause of death is immediately apparent, the circumstance leading to that cause can only be conjectured: probably some extra exertion during the day causing disturbed circulation and increased muscular action of the heart."

REVIEW OF BOOKS.

Hæmorrhoids and Prolapsus of the Rectum: their Pathology and Treatment; with especial reference to the Application of Nitric Acid. With a Chapter on the Painful Ulcer of the Rectum. By Henry Smith, F.R.C.S., Assistant-Surgeon to King's College Hospital. Third Edition. London: Churchill, 1862.

The fact that the book now before us has in so very short a period reached a third edition is, one would think, sufficient to entitle it to the notice of the Profession without any special recommendation. But we should not be doing justice to the talented author were we to omit giving a review of it in our columns.

The diseases of which Mr. Smith treats are of such daily occurrence, and of so painful and troublesome a nature that any one who can improve the treatment of them and bring forward a ready means of cure is entitled to the gratitude not only of the profession, but of society at large. Mr. Smith has evidently given the most careful attention to his subject, and has investigated the pathology of these diseases with extraordinary perseverance, which has led to his obtaining unusual success in their treatment. The result of

his experience given in his book, in an honest and straightforward style, must carry conviction to the mind of the unbiased reader.

In the present edition he has added much new matter, and has described and illustrated certain modes of treating hæmorrhoids and prolapsus, which were not alluded to in the former editions, but which more mature experience (as he expresses it) has justified him in recommending. He has added a short but entire chapter on the painful ulcer of the rectum, which is so often associated with hæmorrhoidal disease, and frequently mistaken for it.

Although it is stated in the title-page that this work has especial reference to the application of nitric acid, Mr. Smith does not by any means discard other modes of treatment, where it is desirable to adopt them, but he has taken great pains in pointing out the cases which can be cured without recourse to the ligature, and compares the results of the different modes, describing the class of cases to which each is applicable, attention to which must save the surgeon from disappointment, and the patient from much unnecessary suffering.

Experience has taught the author to combine other modes of treatment, where desirable, with the application of nitric acid, and on this head we will quote a few of his observations. He says: "Since the publication of the last edition of this work, I have met with a considerable number of old-standing and severe cases of prolapsus of the rectum, where, either from the existence of some organic disease, or from advanced age, the operation by ligature was not admissible, and yet, from the extent and nature of the disorder, it could not be remedied by the application of nitric acid alone. Under such circumstances, I have adopted what may be considered a combined method of treatment, consisting in the employment of nitric acid, and the removal of folds of relaxed tissue from around the margin of the anus."

"It is mainly in those cases where there is considerable prolapsus in weak old persons, associated with a very relaxed condition of the anal orifice, that I adopt this practice, which I can recommend with confidence."

He then goes on to describe the manner in which he proceeds with the operation, and gives cases in illustration of the value of this method. The other modes of treatment are all illustrated with numerous cases in which they have been used, and which are both interesting and instructive.

In concluding our remarks, we can safely say that the whole subject has been treated in a masterly style, and to those who take an interest in the treatment of these troublesome diseases, and wish for useful information on the subject, we confidently recommend a perusal of Mr. Smith's book.

POISONING BY BELLADONNA.

(Extracted from the 'Dublin Medical Press.')

TO THE EDITOR OF THE 'DUBLIN MEDICAL PRESS.'

SIR,—As I do not happen to have heard or read of any cases of poisoning by belladonna *treated in this country* by means of opium, I would feel obliged by your insertion of the subjoined cases in illustration of the antagonistic action of opium and belladonna. I also beg leave to ask for an early insertion, in order that, if a similar occasion should arise—a circumstance not very unlikely to occur—as the fruit of the belladonna is now ripe and attractive, your readers may have an opportunity of still further testing the propriety of this plan of treatment.

I am, Sir, your most obedient servant,

J. H. WHARTON.

27 Upper Merrion street, 28th August, 1862.

Case 1.—Thomas Murphy, æt. 10, was admitted under my care into the Meath Hospital on the 20th instant. His mother, who accompanied him, furnished the following history:—"On the preceding evening, in company with several other children, he repaired to the gardens in Brown street," formerly in possession of the late Mr. Hunt, well known as a chemist and druggist in this city, "from which he returned home about half-past seven o'clock, when he stated that he had eaten some poison berries about two hours previously, that his eyes were dim, and his tongue and mouth 'sticky.' He soon fell asleep, and at nine o'clock was awoke for supper, of which he took none, and was restless and tossing about in the bed all night." On admission, the following particulars were observed:—The patient was delirious, talked to his companions, whom he supposed to be present, laughed, caught at imaginary objects, and picked the bedclothes. On one occasion he sat up in bed and stooped his head, as it were, into a basin of water, with which he went through the form of washing his face with his hands. He had frequent and almost uninterrupted spasmodic jactitations, which at times *appeared* to be not wholly involuntary, and they were occasionally so violent as to render it necessary to prevent him from being rolled or partly thrown out of bed. The movements of the limbs were of a changing character, at one time simulating chorea, at another hysteria, and, after a little, tetanus. On one occasion his head and heels were drawn backward, as in opisthotonos; at another, his upper and lower extremities were extended to the utmost while he lay on his back and whistled a lively air; the pupils were enormously dilated, giving the eyes a brilliant softness; power of vision almost wholly lost; eyes suffused and pinkish; countenance much flushed, and occasionally, his aspect was silly, and not seldom, sardonic; skin not deprived of sensation, as proved by his showing signs of pain and passion when pinched. An indistinct rash was observed by the resident pupil, but it quickly disappeared, as I could not ascertain its presence; general surface of the body warm, with the exception of his legs and feet, which were cool; pulse, 110, and strong; pulsations well defined; respirations, 28; tongue dry, of a yellow brown colour; power of deglutition absent.

Case 2.—Eliza Kenny, æt. 6. History and symptoms very similar to those just described. The spasms were, however, less violent, and the delirium of a more hysterical character. In this instance, deglutition was not wholly lost, but was partly accomplished with much difficulty and perseverance, and with great and determined resistance on the part of the patient.

Case 3.—James Flattley, æt. 11, affected in a manner corresponding to that of his companions. The spasms, however, were neither so frequent nor so severe. Unlike them he was able at intervals to answer a simple question, such as "What's your name?" The comparative mildness of his symptoms was possibly due to his having vomited in the morning a portion of the "berries."

Treatment.—An emetic consisting of sulph. zinc, ℈i. was prescribed for Murphy (No. 1.), which was attempted to be administered by forcing open the jaws and giving it in small quantities. So far, however, from any effect having been produced by this means, it was soon discovered that whatever portion was retained in the mouth was spat out, and often with an *apparently* too-well directed aim at the bystanders. This tendency to spitting, which was manifested more or less all through Murphy's case, was similar to that condition produced by chloroform.

Endeavours were then made to cause evacuation from the bowels by the administration of the following enema:

℞ Spr. tereb. rect. ℥ss.
Olei olivæ, ℥i.
Tinct. assafœtida, ℥ss.
Decocti hordei, ℥vi. M.

On the introduction of the long tube, the patient evidently strained, as if at stool, but no dejection took place. After a proper interval—during which a purgative bolus, composed of fifteen grains of the compound powder of jalap, was placed far back upon the tongue, an enema similar to the above was administered, and with a like result. To subdue the jactitation cold affusion was had recourse to, which produced only a temporary benefit. Sinapisms were also applied to the legs. In Case 2 an emetic of sulphate of zinc was likewise prescribed, which, being followed by mustard and warm water and tickling of the fauces, caused a very moderate emesis; but no satisfactory evidence existed from examining the fluid ejected that it contained any portion of the belladonna fruit. A draught of castor-oil and turpentine was then prescribed. In Case 3, which was admitted after I had left the hospital, a purgative bolus, composed of calomel and jalap, was most judiciously administered by the resident pupil, as deglutition was a matter of no difficulty.

Four o'clock p.m.: The patients' symptoms having been uncontrolled—indeed in Eliza Kenny's case the excitement and flushing of the face were increased, it was resolved to place them under the influence of opium—a matter of difficulty, if not impossibility, with Murphy (Case 1). Accordingly, an eight-ounce mixture was prescribed, containing eighty drops of tincture of opium by measure, of which one ounce was directed to be given to Cases 1—if possible—and 3, every second hour until its action should be observed, and half that quantity to No. 2 at the same intervals.

Ten o'clock p.m.—The Cases 2 and 3 were found to be much relieved, and to have taken their medicines regularly; the former in five, the latter in ten-drop doses. They had had some sleep, and had partaken of food. Beef-tea, and stirabout subsequently, a portion having been rejected. Case 1, however, had taken, or rather been forced to take, only an inappreciable quantity of his medicine, and as his state was not by any means improved, it was determined to exhibit the drug per rectum—a resolution warranted by the success arrived at in Cases 2 and 3.

Accordingly, fifteen drops were injected at midnight, and at two o'clock a.m. on the 21st the report is, "all three sleeping gently." At four, six, and eight o'clock a.m., the medicines in the doses already supplied were regularly given. It was also duly administered in Case No. 1, as he was enabled to swallow in two hours after the exhibition of the opiate enema.

At nine o'clock Case 1 is reported, "Delirium subsided; all spasm gone; is still a little stupid about answering questions; pupils less dilated; a like improvement in the other two." The opium was now administered at increasing intervals, until finally

stopped on the 23rd, when the patients were discharged, moderate dilatation of pupils continuing in Cases Nos. 1 and 3, and none in Case 2. All the cases had double vision at a certain distance, and at uncertain distances, incapability of counting correctly was manifested; none had anæsthesia. Retention of urine was not present in any. It passed involuntarily in Case 2, not so in Case 3, the subject of which expressed a desire to relieve his bladder. With regard to Case 1, I am unable to speak with greater certainty than that before admission, according to the mother's account, there was no retention. All were flushed, and, as before mentioned, the muscular movements were similar, though greatly intensified, and varied in Case 1. In all, the pupils were obviously less dilated during sleep than wakefulness—a condition verified by repeated observation. The quantity of opium taken by Case 3 amounted to about fifty-five drops; by Case 2, double that quantity; by Case 1, reckoning only from the exhibition of the opiate enema, eighty-five. With regard to the opium, it is perhaps not unworthy of mention, that the bowels continued constipated in Case No. 1, as also the inability to swallow until the antagonistic effect of opium had been observed; that vomiting in Case 3 occurred under the same circumstances, although no emetic had been prescribed; and the same may be said of Case 2, for the vomiting which occurred after the partial exhibition of the sulph. zinc and mustard, was rather the return of the small portion of these substances which had been swallowed.

I cannot bring the foregoing to a close without acknowledging my obligations to Mr. John J. Ball, the acting resident pupil at the Meath Hospital, who reported the foregoing cases, and who, from personal inspection carried on every two hours by night and day, so long as the urgency of the symptoms continued, was enabled to note the above particulars.

MEDICAL SOCIETIES.

EPIDEMIOLOGICAL SOCIETY.

MONDAY, JULY 7.

DR. BABINGTON, F.R.S., President, in the Chair.

A communication, by Dr. ARCHIBALD SMITH, was read on

DIPTHERIA IN PERU.

The following important information on the occurrence of diptheria in Peru had been communicated by Dr. Archibald Smith in a note to Mr. Radcliffe since the previous meeting. Dr. Smith has known Peru ever since 1825, but he had never heard of or seen diptheria there as an epidemic until 1858-59. In the former of these years the disease proved very fatal among children; in 1859 it was less prevalent, and consequently attended with fewer deaths. The affection was superinduced on the following epidemic sequence, as noticed in Lima, the capital of Peru. Lima is situated six miles from the sea, at an elevation of 500 feet, with a winter temperature of 60 deg. to 64 deg. F. as minimum, and summer heat of 80 deg. to 84 deg. as maximum. Atmosphere generally humid, and climate relaxing. Barometer all the year round 29½ to 29¾. Malarial and pythogenetic causes are always fertile causes of disease, such as intermittent, remittent, and typhoid fevers. The sewage gas is often extremely offensive, and it is by no means uncommon to see the intermittent pass into the declared typhoid form, while pure typhus *per se* is seldom seen in civil practice, judging from Dr. Smith's own experience. In 1851 reigned in August and September a catarrhal fever or influenza, which extended all over Peru. 1852. A mild adynamic fever, with a red cutaneous eruption, which attacked all but destroyed none, like the "Polka" of Brazil, which Dr. Lallemand called the first stadium of yellow fever. 1853. What may be called an epidemic of nascent yellow fever, terminating with a few cases of black vomit by end of autumn. 1854. Yellow fever in aggravated form. 1855. No yellow fever, but epidemic intermittents. 1856. Intermittents disappear, and the yellow fever returns. 1857. In August and September, catarrhal influenza. 1858. Diptheria as an epidemic. 1859. Diptheria on the wane, and small-pox prevalent. "This last year," remarks Dr. Smith, "on the third or fourth day of high fever I was called to see a youth, when I observed the false membrane in the throat and fauces, and next morning on return found the diptheria vanished, and the eruption of small-pox fairly established."

HIRSCH'S RESEARCHES IN HISTORICO-GEOGRAPHICAL PATHOLOGY.

Dr. Weber read an analytic summary of the important work of Dr. Hirsch, of Dantzic, entitled "Handbuch der Historisch Geographischen Pathologie," and which the author has dedicated to the London Epidemiological Society, "in acknowledgment of their efforts and services in the promotion of public hygiene." The first volume was published in 1859, and the first part of the second volume last year. It is the first systematic attempt to treat in a worthy manner the great and difficult subject of the chronological and geographical distribution of all epidemic diseases throughout the world. The amount of research among the Medical literature of Europe generally, displayed by the author, is not surpassed by that of Dr. Copeland himself in his Herculean task, and the impartiality and discriminating judgment are on a par with the erudition. Dr. Weber concluded his summary by pointing out the great desirableness of having an English translation of Dr. Hirsch's work, and the especial duty of English Medical men availing themselves of the singularly favourable opportunities which they enjoy above their Professional brethren of any other country in investigating epidemic diseases in the numerous and widely-dispersed dependencies of the British Empire.

A communication was also read from Dr. S. HALL, of Hobart Town,

ON THE VITAL STATISTICS OF TASMANIA IN 1861.

The total registered deaths in the colony during the year were 1,472, to which must be added the deaths of seven convicts not stated in the public records. As the population of Tasmania on April 7, 1861, amounted to 89,977, the death-rate that year would be a trifle over 16 per thousand of the inhabitants, or one death in about 60 or 61 individuals. Among the exclusively rural population, estimated at between 53,000 and 54,000, the death-rate did not much exceed 11 per thousand; but even this low rate is above what it ought to be, as there is a considerable number of preventible deaths constantly occurring from the neglect of sanitary precepts. The proportion of children in the population of Tasmania is much greater than in England and other European countries. According to the census of last year, the children under 15 years of age constituted about 38 per cent. of the whole population, while in England, at the census of 1851, this proportion was only 35, and in France it did not exceed 30 per cent. Of the 1,479 deaths, 323 were in children under one year; 124 occurred between 1 and 2 years; 53 between 2 and 3; 22 between 3 and 4; 40 between 4 and 5; and 67 between 5 and 10 years. The three last groups were all above the usual proportions, owing to the prevalence of measles, which had not visited Hobart Town for six or seven years previously. Of the deaths in middle and advanced life, 28 occurred between 80 and 90 years of age; 3 between 90 and 100; and 2 in persons upwards of 100. Everything seems to indicate a great salubrity of climate. The total registered births in the colony during 1861 were 3,207, but as many escape registration. Dr. Hall estimates the natural increase of the population at nearly 4,000. In 1861 the rainfall, a trifle over 28 inches, exceeded the mean of the twenty previous years by upwards of 6 inches.

OUR NOTE BOOK.

ON THE CALORIFIC AND VASCULAR NERVES OF THE SYMPATHETIC.

By M. CLAUDE BERNARD.

This paper is the first of a series which M. Bernard is presenting to the *Académie des Sciences*, and has in view the demonstration that the vascular and calorific nerves are special nerves to be topographically and physiologically distinguished from the ordinary motor nerves. Having opened the spinal canal in dogs, he divided as they left the cord all the origins of the sacro-lumbar plexus (sometimes on one side and sometimes on the other) which supplies sensation and motion to the hinder extremity. The limb became completely paralysed, but no calorification or vascularisation was observed, the temperature on this side often, indeed, diminishing. When only the posterior and anterior roots were divided, corresponding abolition of sensation or of motion occurred; but in neither case was there any vascularisation or change of temperature in the limb. In a dog in which complete paralysis of the left hind leg was produced by division of the origins of the sacro-lumbar plexus the sciatic nerve was afterwards divided. Its origin having been already divided, this subsequent section was not felt, and added nothing to the paralysis of motion and sensation that already existed; but vascular and calorific phenomena immediately followed, the temperature of the limb steadily rising until it was from 6° to 8° C. higher than that of the opposite one, and so continued untill the death of the animal next day.

The experiment was repeated a great many times with exactly the same result. It is evident, therefore, that nerves influencing these functions must have become adjoined to the motor and sensitive nerves in the short interval between their issue from the canal and the point where the sciatic was divided. It is only the sympathetic, placed on the sides of the spinal column, which could thus become joined to these nerves; and M. Bernard, in another experiment, destroyed the ganglion of the sympathetic and its filaments, which lay upon the side of the fifth and sixth lumbar vertebræ, leaving the nerves of the sacro-lumbar plexus entirely intact. An excess of temperature in the limb was immediately observed, and during the three days the animal lived, the paw of the side operated upon was from 5° to 8° hotter than the other,—no paralysis whatever being present. The conclusion to be drawn is that there are three distinct descriptions of nervous influence,—1. The sensitive, due to the posterior roots of the sacro-lumbar plexus; 2. The motor or muscular, belonging to the anterior roots; and 3. The vascular and calorific, due to the sympathetic.—'Gaz. des Hôp.' and 'Med. Times.

LEGAL INTELLIGENCE.

WAKEFIELD COUNTY COURT.

LIABILITY OF MASTERS TO PAY FOR MEDICAL ATTENDANCE ON SERVANTS.—HORSFALL *v.* NETTLETON.

An action has recently been tried at the County Court at Wakefield, involving a question of considerable importance to the profession—the liability of masters to pay for medical attendance on their servants. The plaintiff was Mr. Henry Horsfall, surgeon; the defendant, a widow lady. The amount was nine shillings and six pence for medicine and attendance. On the 4th of December, 1856 Mr. Horsfall received a message to go and attend defendant's servant. He did so, and prescribed for her on four occasions. His books were produced, in which were entries, "Mrs. Nettleton, pro servant." He did not know the servant's name, nor did he remember to have attended her previously. He sent in his bill in January, 1857. Defendant went to the Isle of Man and could not be found. In cross examination, Mr. Horsfall said that Mrs. Nettleton did not say that she would be liable for the payment, but she did not say the contrary.

Mrs. Nettleton, in defence, said that she remembered her servant being taken ill. At that time Dr. Atkinson was attending her own son, and she proposed to the servant that he should attend her also. This offer was declined, as the servant said that she had seen Mr. Horsfall before, and would prefer seeing him again. Defendant offered that if Dr. Atkinson attended her it would be without charge, but if she employed Mr. Horsfall it would be at the patient's own expense. She did not receive any bill till about three years ago, when it was accompanied with a threatening letter, which she handed to her solicitor.

Mrs. Kenyon, a servant of Mrs. Nettleton, deposed that she went for Mr. Horsfall.

For the defence it was urged that there had been no contract, and that Mr. Horsfall had been sent for without defendant's knowledge or consent: but it was admitted that he had had an interview with defendant immediately after he had seen the servant.

The judge, in giving his decision, stated that a contract might be either expressed or implied. In this case he thought that an implied contract was clearly established, and as it was the usual custom for masters and mistresses to pay for medical attendance on those in their service, he should give a verdict for the plaintiff.

Whether this decision may be taken as a *legal* precedent remains to be seen.

Births, Marriages, and Deaths.

BIRTHS.

ALTHAUS.—On the 30th ult., at Bryanstone street, the wife of Julius Althaus, M.D., of a daughter.

EDWARDS.—On the 28th ult., at Benarth, Carnarvonshire, the wife of James Edwards, M.D., of a son.

EVERSHED.—On the 2nd inst., at Billingshurst, Sussex, the wife of Thomas E. Evershed, Esq., M.R.C.S., of a son.

HARRIS.—On the 29th ult., at High street, Falmouth, the wife of Arthur B. Harris, L.R.C.P.E., of a daughter.

HASLAM.—On the 29th ult., the wife of George H. Haslam, Esq., M.R.C.S., of Shropshire street, Market Drayton, of a daughter.

TAYLOR.—On the 26th ult., at Hutton hall, Penrith, the wife of Michael W. Taylor, M.D., of a son.

WILLIAMS.—On the 30th ult., at Menai bridge, Anglesea, the wife of D. W. Williams, M.D., of a son.

MARRIAGES.

CASTLE—GATEHOUSE.—On the 28th ult., at Emsworth, Hants, William Henry B. Castle, L.R.C.P., of Landport, Portsmouth, to Harriette, elder daughter of the late John Gatehouse, of the same town.

SMITH—BROWN.—On the 28th ult., at Christ church, Blackfriars road, John Smith, Esq., M.R.C.S., of Wrangle, Lincolnshire, to Elizabeth Ellen Woods, eldest daughter of the Rev. Joseph Brown, M.A., Rector of Christ church.

SMITH—PARBURY.—On the 27th ult., at All Saints' church, Clapham park, Thomas Smith, Esq., F.R.C.S., of Montague street, Russell square, to Ann Eliza, daughter of Fred. Parbury, Esq., of Sydney house, Clapham park.

DEATHS.

ADRIEN.—On the 22nd ult., at Malta, John Joseph Adrien, L.R.C.S. Irel., Staff Assistant-Surgeon, Army (February 10, 1854), formerly Assistant-Surgeon 22nd Regt. of Foot (only son of the late John T. Adrien, Esq., Professor of Medical Jurisprudence, Royal College of Surgeons, Ireland).

BRICE.—Recently, William Henry Brice, L.R.C.S. Irel., Assistant-Surgeon 28th Regiment of Foot, Bombay.

FORBES.—On the 30th ult., of consumption, at Torquay, James Forbes, M.D., British Consul at Santiago de Cuba, aged 57.

GUNNING.—On the 24th ult., Henry James Gunning, M.R.C.S. Eng., of Cloughton, near Scarborough, Yorkshire, aged 55.

HILL.—July 7, of cholera, at Agra, William Henry Hill, M.R.C.S. Eng., Assistant-Surgeon 35th Regt. of Foot (January 19, 1860), aged 25.

IRVINE.—On the 27th ult., at Banchory, James Irvine, M.R.C.S. Eng., of Old Aberdeen.

LEWIS.—On the 12th ult., suddenly, at Wymondham, Norfolk, Lewis Lewis, M.R.C.S. Eng., L.S.A. Lond., aged 54.

M'KECHNIE.—Recently, Andrew M'Kechnie, Surgeon, Royal Staff Corps, on half-pay.

SIMPSON.—Recently, E. Simpson, Surgeon Royal Artillery.

SOMERVILLE.—Recently, W. Somerville, M.D., Principal Inspector-General of Hospitals, on half-pay.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the science and practice of Medicine, and received certificates to practise, on the 28th ult.:—James, Duce, Wednesbury, Staffordshire; John James Flinn, Liverpool; John Abernethy Hicks, Emsworth, Hants; David Watkin Hughes, Wymondham; George Mowat, Plymouth; Francis Trimmer, Gloucester.

The following gentlemen also on the same day passed their first examination:—Frederick A. Best, St. Bartholomew's Hospital; James Chapman, Grosvenor-place School.

QUARANTINE.—In consequence of disease being prevalent in Arabia and Egypt, quarantine is strictly maintained in Malta, Tunis, and in many of the Mediterranean ports.

LONDON WATER.—According to the analyses of Dr. R. D. Thomson, the waters used in London for domestic purposes are more impure than might have been expected at this season of the year.

YELLOW FEVER.—Her Majesty's ship 'Landrail,' 5 guns, Commander Martin, arrived at Jamaica on the 25th of July, from Havannah, having on board some cases of yellow fever. Eight sufferers from the malady were landed and placed in the naval hospital. One man died on board, and six subsequently succumbed to the disease. She left again on the 26th for a cruise. The 'Ariadne,' 26 guns, Captain Vansittart, arrived on the 27th from Carthagena, with about thirty cases of ordinary fever on board, which it was hoped would not—as was the case under similar circumstances last year—assume the more serious type. The 'Ariadne' was about to leave Jamaica for Vera Cruz, with provisions for the 'Phaeton,' and then to go to the northward on account of her sickly state.

DEATH FROM CHLOROFORM.—Last week an inquest was held at King's College Hospital, by Mr. Bedford, on the body of Elizabeth Freed, aged seventeen. She was admitted in consequence of injuries received from a fall, and was suffering from a sphacelated wound. An operation being necessary, she was submitted to the influence of chloroform, which, as the patient was of a nervous temperament, was administered with great caution, in a short time after which she died. It appeared that she suffered from fatty degeneration of the heart. The verdict was given accordingly, with the remark that the chloroform was properly administered.

TREATMENT OF MILITARY SURGEONS IN AMERICA.—It will be remembered that when the Confederate army entered Winchester, the Union Hotel Hospital, with its surgeons and assistants (eight), its attendants, nurses, and inmates, all fell into the hands of the Confederate General Jackson, as prisoners of war. So far from destroying the hospital, as at first reported, he directed Brigade-Surgeon Peale to continue in charge, and was informed that all the Federal sick and wounded would be placed under his care. Surgeon Peale accepted the position, and the labours of the hospital were, as before the capture, performed with devotion and skill. The Confederate general went a step further, and has presented an example which is not only worthy of record, but also of imitation by the whole civilised world, in warfare. The surgeons and assistant-surgeons were "unconditionally released" upon their "parole of honour," "to report in person, singly or collectively, to the Secretary of War at Washington as such," at the same time pledging themselves to use their "best efforts that the same number of medical officers of the Confederate States army, now prisoners, or who may be hereafter taken, be released on the same terms," and "to have this principle established"—viz., "the unconditional release of all medical officers taken prisoners of war hereafter." Comprehending the humanity and magnanimity of this act of the Confederates, and in accordance with it, we observe it is announced (not officially, however,) that the Secretary of War has not only unconditionally released all the Medical officers of the Confederate army, held as prisoners of war, but has directed that all those officers hereafter taken, be also unconditionally released. We are pleased to record this action on the part of the powers at war, and regard it as an important step towards the recognition of the surgeon upon the battle-field, not as a partisan or belligerent, but as an angel of mercy, commissioned to meliorate the woes of humanity.

PREVENTABLE ILLNESS.—Dr. Farr calculates that there are every year over 100,000 premature deaths in England, and more than 1,000,000 persons who suffer from serious illness, also the direct result of the neglect of the laws of health.

Appointments.—Daniel Robert Alcock, M.R.C.S. Eng., L.A.H. Dub., Assistant-Surgeon R.N., has been appointed to the *Resistance*. —Cunningham Atchison, Surgeon R.N. (seniority, April 16, 1862), has been appointed to the *Severn* (additional).—Charles Henry Biddle, M.R.C.S. Eng., L.S.A. Lond., has been appointed House-Surgeon to the General Dispensary, Leeds, *vice* Matthew Algernon Adams, M.R.C.S. Eng., L.S.A. Lond., resigned.—S. A. Bindley, F.R.C.S. Eng. (exam.), has been appointed Treasurer of the Medical Benevolent Society, Birmingham, in room of Mr. Bartlet, resigned.—T. Lewis Brittain, M.D. Edin., has been appointed House-Surgeon to the Birmingham Lying-in Hospital and Dispensary for Diseases of Women and Children.—Thomas Clark, L.R.C.S. Irel., Assistant-Surgeon 33rd Regiment of Foot, has been appointed to Medical charge of the Sanatorium at Poorundhur, *vice* William Harvey Brice, Assistant-Surgeon 28th Regiment of Foot, deceased. —M. H. Clayton, M.R.C.S. Eng., has been appointed President of the Medical Benevolent Society, Birmingham, for the ensuing year. —Assistant-Surgeon E. S. Cleveland, M.D., M.R.C.S. Eng., has been appointed to officiate as Garrison Assistant-Surgeon at Bengalore, during the absence of Dr. Houston on other duty, or until further orders.—John Swanwick Drennan, M.D. Trin. Coll. Dub., L.R.C.S. Irel., on retiring by rotation, has been re-elected Physician to the Belfast General Hospital.—William Eddowes, jun., M.R.C.S. Eng., L.S.A. Lond., has been appointed House-Surgeon to the Salop Infirmary, Shrewsbury, *vice* William Alexander Provis, M.R.C.S. Eng., L.S.A. Lond., resigned.—George Elin, M.D. St. And., M.R.C.S. Eng., L.S.A. L.M. Lond., Surgeon to the Hertford Infirmary, has been appointed Medical Officer to Haileybury College, Hertford, late the East India College.—James Foster Gray, F.R.C.S. Eng. (exam.), L.S.A. Lond., has been elected one of the Surgeons of the Royal Victoria Dispensary, Northampton, *vice* Charles Dodd, M.R.C.S. Eng., L.S.A. Lond., deceased.—James Hardie, M.D., L.R.C.S. Edin., has been appointed House-Surgeon to the City and County Infirmary, Perth, *vice* William Roy, M.D. Univ. Edin., who is about to enter on a new sphere of labour.—John Pitt Harris, L.R.C.P. Edin., L.R.C.S. Irel, L.M. Combe, Lying-in Hospital, Dublin, has been elected Medical Officer for the Louisburgh Dispensary District of the Westport Union, Co. Mayo. *vice* D. O'Grady, resigned.—T. Henry Hughes, M.D. Edin., M.R.C.S. Eng., has been appointed House-Surgeon to the Birmingham Lying-in Hospital and Dispensary for Diseases of Women and Children.—Henry Leach, M.R.C.S. Eng., L.S.A. London, has been elected Physicians-Assistant and Apothecary to the *Dreadnought* Hospital Ship off Greenwich, *vice* Mr. John Cooke, M.B. Univ. Lond., F.R.C.S. Eng. and L.M., L.S.A., Lond., resigned.—Owen J. Llewellyn, Surgeon R.N. (seniority, May 23, 1861), has been appointed to the *Severn* for the *Pantaloon*.—Henry Murney, M.D., Univ. Edin., M.R.C.S. Eng., L.M. Rot. Hos. Dub., on retiring by rotation, has been elected Surgeon to the Belfast General Hospital.—Thos. Odell, M.R.C.S. Eng., L.S.A. Lond., has been appointed Surgeon to the General Infirmary, Hertford, *vice* Richard David Jones Evans, M.D. Mar. Coll. Aberd. F.R.C.S. Eng. (Hon.), L.S.A. Lond., deceased.—George Andrew Paterson, M.D. Univ. Edin., F.R.C.S. Edin., has been appointed one of the Deputy-Commissioners of Lunacy in Scotland.—O. Pemberton, M.R.C.S. Eng., Surgeon to the General Hospital, Birmingham, has been appointed one of the Directors of the Medical Benevolent Society, Birmingham.—William Edward Powell, L.F.P.S. Glasg., L.S.A. Lond., has been elected Medical Officer and Public Vaccinator for the Kirton District of the Boston Union, Lincolnshire, *vice* Edward Lane, M.R.C.S. Eng., L.S.A. Lond., resigned.—Dr. W. F. Wade, sen., Physician to the Queen's Hospital, Birmingham, has been appointed one of the Vice-Presidents of the Medical Benevolent Society, Birmingham, for the ensuing year.—T. W. Williams, M.R.C.S. Eng., has been appointed one of the Vice-Presidents of the Medical Benevolent Society, Birmingham, for the ensuing year.—Robert Wollaston, M.R.C.P. Lond., F.R.C.S. Eng. (exam.), has been appointed Visiting Physician to the Institution for the Insane of the Upper and Middle Classes, Coton-hill, Stafford, *vice* Dr. Edward Knight, M.D. Eman. Coll., Cantab., deceased.

Healthy Appetites in the Isle of Wight.—Our island at the present time is full of visitors, and an idea may be gathered of the necessary amount of food required to sustain them, together with the 55,000 inhabitants in addition, when we mention that the last fortnightly gathering of sheepskins alone by the fellmongers, without the addition of some hundreds of lamb-skins and hides, amounted to upwards of 1,800, showing that 900 sheep must have been slaughtered here per week, in order to supply the demand of the consumers of mutton, and this number was actually exported from Newport quay on Wednesday; and it is very likely that the next fortnightly collection will be still greater.—'Hants Independent.'

Battles in Hot Weather.—The New York Press are anxiously discussing the probable influence of climate on the fate of the war. It has been assumed that malaria, musquitoes, "yellow jack," and alligators would be more fatal to the Federal armies than the weapons of their antagonists. But we think, says the 'New York Evening Post,' both our enemies and our friends have placed too much stress on this question of climate. It is well known that Europeans, for several years after their arrival in India, are better able to endure the heat than even the natives and the acclimated residents themselves. After a time their stamina are impaired, and they suffer like the rest. The Europeans who have constituted the Indian armies of France and England, whether in the time of Lally or since, have been able to go through their campaigns with vigour and success. So, too, during our own revolution, our soldiers were never so overcome by the climate of the South but that they were able to fight battles and accomplish marches far more successfully than when they were sufferers from the cold, and experienced the horrors of such camps as Valley Forge. In Mexico their endurance of that *tierra caliente* was equally conspicuous. In the great Continental wars of the beginning of this century, it was the experience of Guthrie, Larrey, and the other great Military Surgeons, that the power of bearing extreme heat or cold depended more on the intrinsic stamina of the troops, than on the place of their nativity. But this subject has been thoroughly inquired into by our Government in former years, and the result of the inquiry no one knows better than Jefferson Davis himself. The Medical statistics of our army from 1837 to 1854 were within his own observation, and he himself, when Secretary of War, transmitted to Mr. Bright, President of the Senate, a particular report on the subject. The comparison made between the endurance on a South Carolina and a New York regiment discloses the following facts:—In the campaign of 1847 the 1st regiment of South Carolina, 1034 strong, serving for 18½ months, lost by disease 509 men. The New York 2nd, 1063 strong, during the same period lost but 276! The loss from other and accidental causes was one-third less in the New York than in the South Carolina regiment. This would show that if disease and climatic influences are to "fight in their courses" against the combatants in the field or in garrison, the enemy will lose two men to our one. The following is a list of the battles fought during hot months in the war of the revolution:—

June	1775.	Battle of Bunker hill.
"	1776.	Attack on Fort Moultrie by the British.
"	1778.	Battle of Monmouth.
July	1778.	Battle of Wyoming.
"	1779.	Tryon's Expedition.
"	"	Capture of Stony Point.
Aug.	1776.	Battle of Long Island.
"	1777.	Defeat of St. Leger.
"	"	Battle of Bennington.
"	1778.	Battle of Rhode Island.
"	1780.	Battles of Hanging Rock and Camden.
Sept.	1777.	First Battle at Stillwater with Burgoyne.
"	"	Battle of Brandywine.
"	"	Battle of Eutaw Springs.

All these battles, North and South, were fought in the hottest weather of the year, and both armies were in full activity.

Another Operation of Ovariotomy in Paris.—M. Nélaton performed this operation on the 9th of July last, upon a patient forty-one years of age, who had been tapped a dozen times before. The cyst was multilocular, and the abdominal development considerable. The patient has done extremely well, and forty days after the extirpation of the cyst the wound was healed up. All the usual precautions in operations of this kind were scrupulously enforced, and M. Nélaton may congratulate himself upon the issue of this case. It is very likely that other surgeons will be inclined to imitate the Professor, who, it will be remembered, became reconciled to the operation by witnessing a series of them performed by Mr. I. Baker Brown.—'Lancet.'

APPOINTMENTS FOR THE WEEK.

Wednesday, September 10.

Operations at Middlesex Hospital, 1 p.m.; St Mary's Hospital, 1 p.m.; University College Hospital, 2 p.m.

Thursday, September 11.

Operations at St George's Hospital, 1 p.m.; Central London Ophthalmic, 1 p.m.; London Hospital, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Great Northern Hospital, King's cross, 2 p.m.; West London Hospital, 2 p.m.; Royal Orthopædic Hospital, 2 p.m.

Friday, September 12.

Operations at Westminster Ophthalmic Hospital, 1½ p.m.

Saturday, September 13.

Operations at St Thomas's Hospital, 1 p.m.; St Bartholomew's Hospital, 1½ p.m.; King's College Hospital, 1½ p.m.; Charing-cross Hospital 2 p.m.

Monday, September 15.

Operations at St. Mark's Hospital for Fistula and other Diseases of the Rectum, 1½ p.m.; Metropolitan Free Hospital, 2 p.m.

Tuesday, September 16.

Operations at Guy's Hospital, 1½ p.m.; Westminster Hospital, 2 p.m.

BOOKS RECEIVED FOR REVIEW.

The Winter Climate of Menton. By P. C. Price, F.R.C.S.E. London John Churchill, New Burlington street.

NOTICES TO CORRESPONDENTS.

A STUDENT.—Mr. Hogg's book on the Microscope, is as good an one for your purpose as you can purchase.

L.S.A.—We are much obliged to you, but we decline the paper. The 'Medical Times and Gazette' is the organ of the Apothecaries' Society, and might therefore be glad of your contribution.

W. H.—1st. The tincture of hellebore is a pharmacopœial preparation, but it is now rarely used.—2nd. We cannot say.

A UNION SURGEON.—Undoubtedly you would be liable to an action if you sent the man to an asylum, under the circumstances. It is a mistake to suppose that a second certificate would screen you, although it is probable the damages would be trivial. You must remember Mr. Wakem's case, and that there is such a thing as lawyers' costs.

CHIRURGUS on the "Pharmacy" question received. The present regulations must be altered in favour of instruction in pharmacy. We do not approve of long apprenticeships.

Mr. HENRY S.—1st. Yes.—2nd. Yes.

Dr. J. E. B.—You would have no difficulty if you advertised. We think the terms reasonable.

GULIELMUS.—Walton and Maberley, Gower street. Price 12s. 6d.

SENEX.—Your letter shall be forwarded.

ILLEGITIMACY IN SCOTLAND.

To the Editor of the Medical Circular.

SIR,—In last week's copy of your Journal, there appeared an account of a lecture to young women, on "Illegitimate Births," delivered by Dr. Strachan, of Dollar. In this philosophical lecture which says very little for the morality of the people of Dollar (if truly represented!), and especially for the labours of those who have spent their time, strength, and patience, in a work that is not likely to contribute in the smallest degree to the happiness and enjoyment of those over whom they have presided as ministers of the Gospel for years. If the seed has been sown, I am afraid, it must have fallen on "stony places," or by the "wayside," where it was either scorched by the sun and withered away, or was devoured up by fowls, when the proportion of illegitimate children stands so high with them. There are several statements made by Dr. Strachan worthy of observation, and one in particular, to which I beg to call the attention of the readers of your Journal, and that is, to the high proportion of illegitimate children in Dollar; according to Dr. Strachan's report, it is from 12 to 36 per cent., which seems to differ widely from the statistics newly published by the Registrar-General of Scotland,—showing only 9 per cent., which proportion is perhaps less than that of any other country in Europe.

There are other strange conclusions drawn in this lecture by Dr. Strachan, which in my opinion are all hypothetical, and strongly militates against good moral principles, instead of in their favour, as you would expect from one of Dr. Strachan's position in life, and if followed out would greatly increase the tendency of immorality, rather than diminish it.

The young ladies of Dollar are deeply indebted to Dr. Strachan for saying so much in reference to the purity of their morals, &c. I presume Dr. Strachan sleeps under the impression that this is evident proof of his own success amongst them. SCOTCHMAN.

Mr. W. JOHNSON.—No.

A SUBSCRIBER.—Carbonic acid gas has been employed as an anæsthetic with success. M. Ch. Ozanam read a paper on it before the Paris Academy of Science. Whether suffocation will not succeed as well is a question you had better answer for yourself by experiment. Partial suffocation would, no doubt, induce anæsthesia. It would be a perilous process, however.

Dr. ROBINSON.—Note received, with enclosures.

Dr. H. SMITH.—We believe that the old regulations will cease to be in force at the termination of this year.

ALPHA.—Any instrument maker will supply you with Czermak's laryngoscope. Apply to Mr. Ferguson, of Smithfield. The best description of the instrument and its mode of application, has appeared in the MEDICAL CIRCULAR, from the pen of Mr. Yearsley.

H. B.—We would advise you not to interfere.

PHYSIC.—We have no recollection of having received any note with such a signature.

EARTHWORMS.

To the Editor of the Medical Circular.

SIR,—Will you kindly inform me among your correspondents, whether an ordinary Earthworm is considered to have any eyes, or to be totally shut out from the light of day. I am your constant Subscriber,

IGNORAMUS.

Dr. TUTHILL MOSSEY.—Enclosure received.

Dr. FLEMING.—Note received.

St. Mary's Hospital Medical SCHOOL.—The WINTER SESSION will commence WEDNESDAY, OCTOBER, 1st, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Dr. SIEVEKING, after which a CONVERSAZIONE will be held.

As an incentive to Clinical Study, the Medical Appointments in this Hospital, including FIVE HOUSE-SURGEONCIES, have always been open to its Pupils without additional Fee or expense of any kind: thus offering advantages, both professional and pecuniary, of far more value to the Student than any system of Scholarships or Prizes.

Physicians—Dr. Alderson, Dr. Chambers, Dr. Sibson, Dr. Handfield Jones, Dr. Sieveking, and Dr. Markham.
Surgeons—Mr. Coulson, Mr. Lane, Mr. Ure, Mr. Spencer Smith, Mr. Walton, and Mr. J. Lane.
Physician-Accoucheur—Dr. Tyler Smith.
Ophthalmic Surgeon—Mr. White Cooper.
Aural Surgeon—Mr. Toynbee.
Surgeon-Dentist—Mr. Sercombe.

LECTURES.—Medicine: Dr. Chambers and Dr. Sibson. Surgery—Mr. Lane and Mr. Spencer Smith.—Physiology: Dr. Broadbent.—Anatomy: Mr. Gascoyen.—Operations on the Dead Body: Mr. James Lane.—Dissections: Mr Norton and Mr. Coombs.—Chemistry—Dr. Matthiessen.

SUMMER SESSION.—Midwifery: Dr. Tyler Smith and Dr. Grailly Hewitt.—Materia Medica: Dr. Sieveking.—Botany: Dr. Dresser.—Medical Jurisprudence: Dr. Sanderson.—Practical Chemistry: Dr. Matthiessen.—Ophthalmic Surgery: Mr. White Cooper.—Aural Surgery: Mr. Toynbee.—Dental Surgery: Mr. Sercombe.—Comparative Anatomy: Mr. Mivart.—Natural Philosophy: Mr. Smalley.

Clinical Lectures on Medicine and Surgery are delivered twice a week, throughout each Session by the Physicians and Surgeons.—A Maternity Department is attached to the Hospital.

Students are required to perform the duties of Clinical Clerks and Dressers in each Session during the last two years of their curriculum.

PRIZES, &c.—A Scholarship in Anatomy of the annual value of 25*l*.—A Prize of 20*l*. for Students of the First Year.—Prizes in the several Classes, at the end of each Session, of the average value of Five Guineas.—Two Prosectors, who each receive 5*l*. and a Certificate.

The Fee for the Hospital Practice and Lectures required by the Colleges of Physicians and Surgeons, and the Society of Apothecaries, is 89*l*. 5*s*., which may be paid by instalments.

A detailed Prospectus will be sent and further information obtained on application to

GEO. G. GASCOYEN, Dean of the School.
St. Mary's Hospital, August, 1862.

New American Preparations.—W. TWINBERROW begs to inform the Medical Profession that he has had a large consignment (direct from Keith and Co. of New York) of all the most valuable American Medicinal Preparations. Also—

EXT. CANAR. INDICA, direct from Calcutta.
PIERLOT'S VALERIANATE of AMMONIA.

Pharmaceutical Chemist, 2 Edwards street, Portman square, London.

St. Bartholomew's Hospital and MEDICAL COLLEGE.—The WINTER SESSION will commence OCTOBER 1, with an Introductory Address by Dr. MARTIN, at Four o'clock p.m.

LECTURES.

Medicine—Dr. Black and Dr. Kirkes.
Surgery—Mr. Lawrence and Mr. Coote.
Descriptive Anatomy—Mr. Skey, and Mr. Holden.
Physiology and General Anatomy—Mr. Savory.
Chymistry—Dr. Frankland.
Demonstrators of Anatomy—Mr. Callender & Mr. Smith.
Demonstrator of Morbid Anatomy—Dr. Andrew.

SUMMER SESSION, COMMENCING MAY 1, 1863.

Materia Medica—Dr. Farre.
Botany—Dr. Harris.
Forensic Medicine—Dr. Martin.
Midwifery—Dr. Greenhalgh.
Comparative Anatomy—Mr. Callender.
Practical Chymistry—Dr. Frankland.

The Hospital contains 650 Beds, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows, Dr. Farre, and Dr. Black; on the Surgical Cases, by Mr. Lawrence, Mr. Skey and Mr. Paget; and on Diseases of Women, by Dr. Greenhalgh.

Collegiate Establishment—Students can reside within the Hospital walls, subject to the collegiate regulations. Some of the Teachers connected with the Hospital also receive Students to reside with them.

Seven Scholarships, varying in value from 20*l*. to 50*l*., are awarded annually. Further information respecting these and other details may be obtained from Mr. Paget, Dr. Martin, Mr. Callender, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomical Museum or Library.

Grosvenor-place School of MEDICINE, No. 1 Grosvenor place (adjoining St. George's Hospital).—Session 1862-63.

The Introductory Lecture was delivered on WEDNESDAY, OCTOBER 1st, at Three o'clock p.m., by Dr. CHOLMELEY.

WINTER SESSION.

General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Mr. Shatman.
Practical Anatomy—Mr. Lomas.
Chemistry—Dr. Wood.
Principles and Practice of Medicine—Dr. Leared and Dr. Cholmeley.
Principles and Practice of Surgery—Mr. Spencer Wells and Mr. William Adams.

Further information may be obtained of Dr. Richardson, 12 Hinde street, Manchester square, W.

A fully-qualified married SURGEON, of many years experience in country practice, seeks an Engagement with a Surgeon in good practice, either for a Branch or as Out-door Assistant; or would act temporarily as LOCUM TENENS. An arrangement with a retiring Practitioner, or for a share in a practice might be made.—Good references.—Address, SIGMA, "Medical Circular" Office, 20 King William street, Strand.

The London Hospital MEDICAL COLLEGE.

The next WINTER SESSION will commence on WEDNESDAY, OCTOBER 1, 1862, when the INTRODUCTORY LECTURE will be delivered by Mr. HUTCHINSON, at Three p.m.

General Fee to Lectures and Hospital Practice, 84 Guineas, payable in two instalments of 42 Guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone £50.

Students can make Special Entries to Lectures or Hospital Practice.

Further particulars can be had on application to Dr. PARKER, Hon. Secretary, 22 Finsbury square, E.C., or at the College.

LECTURES AT THE LONDON HOSPITAL MEDICAL AND SURGICAL COLLEGE.

Medicine—Nicholas Parker, M.D.
Surgery—T. B. Curling, F.R.S., and Jonathan Hutchinson.
Descriptive and Surgical Anatomy—John Adams.
Physiology, General, and Morbid Anatomy, and Practical Histology—Andrew Clarke, M.D.
Practical Anatomy—John Conper.
Chemistry and Practical Chemistry—Henry Letheby, M.B. Lond.
Anatomy and Pathology of the Teeth and Dental Surgery—H. J. Barret.
Midwifery and Diseases of Women and Children—F. H. Ramsbottom, M.D.
Forensic Medicine—F. H. Ramsbotham, M.D., and ——
Materia Medica and General Therapeutics—Herbert Davies, M.D.
Ophthalmic Surgery—George Critchett.
Botany—Christopher Dresser, Ph.D.
Comparative Anatomy—J. L. H. Down, M.D.
Special Operative Surgery—Mr. Maunder.

Mile-end, August 1, 1862.

Medical.—Wanted by a Gentleman, a situation as an ASSISTANT, who can attend to any case. References as to character will be given if required.—Address, J. H. W. 9 Pit's-oste-Moor, Bury, Lancashire.

J. W. N. Brewer's THERAPEUTIC & SPECIAL PREPARATIONS are Exhibited in Class 2 E, annex International Exhibition Pharmaceutical Society's Department, to which a PRIZE MEDAL has been awarded.

SYRUPS OF THE HYPOPHOSPHITES, BIPHOSPHITES, &c.
HYDRASTIN,—SEPTANDRIN,—PODOPHYLLINE.
INJECTION GUACO, most successfully used in Gonorrhœa, &c.
LIQ. FERRI ET QUINÆ PERACET.

Clinical experience has proved this Preparation to be the most successful remedy in cases of Enœmia, Chlorosis, Neuralgia, &c. &c.

J. W. N. BREWER, PHARMACEUTIST,
5 Liverpool street, E.C., London.
Attention given to all enquiries.

THE MEDICAL CIRCULAR.

WEDNESDAY, SEPTEMBER 17, 1862.

TO THE STUDENTS OF MEDICINE.

(Session 1862-63.)

Gentlemen,—The beginning of a new Session is always a period of interest, equally to teachers, students, parents, sons, and the Profession. We, who have sat in the same theatres, dissected at the same tables, heard, perchance, the voice of the same professors, recal to our memory all the incidents of the career on which you are now entering, and wish you, heartily, God speed! Fathers are solicitous about the industry and virtue of their sons; and sons, thrown off from the family circle, and cast into a new sphere at a critical juncture, when hope and desire and ambition and the pulse of pleasure quicken the feelings, and excite curiosity, are eager to taste the novelties that crowd from every quarter upon the senses.

Circumstances, custom, and opinion have made this huge metropolis the seat of Professional education. That this is a misfortune to all, and a curse to many, I have no doubt.

Loving the metropolis as I do, its vastness, its magnificence, the ever-hurrying hive that inhabits it, the music of its streets, the forceful endeavours that characterise its population, the public activities at work within it, the boundless charities of which it is the theatre, its name of magic and its cosmopolitan sympathies, I still regard it as a snare to the young and inexperienced. Apart from its moral aspects, metropolitan life is unfriendly to habits of study; its manifold temptations solicit the youth to resorts more congenial to his quickening desires than either books or dry bones; and if a considerable portion of his first and second year is dissipated in idle indulgences we cannot be surprised, and may not harshly blame. We do not expect young men, fresh from the restraints of home, to have all the self-control of veterans in moral duty, nor to exercise all the vigilance against insidious vice which comes from long service in standing guard over treacherous passions. What we can do, however, we ought. We may warn where we cannot guide. Though we cannot steer the ship, we may lay down a chart for the instruction of the helmsman.

I imagine you nurtured in some sweet vale of Devon, with its flanking slopes covered with apple-orchards, and its white lime-washed cottages shining through the foliage for many a mile; the air is filled with a sweet and dreamy fragrance of honeysuckle, pouring out its rich odour from its golden cups as it hangs on the hedge-side, and winds its tender arms round the thorn and dwarf-oak, and of jasmine climbing up the trellised porch, and resting its delicate white blossom lovingly on the window-sill, of the rose, too, standing sentinel at the door, and double stocks, and sweet-william, and humble mignionette dusting your feet with its perfume; and the hum of bees is mingling in low concord with the ripple of the mill-stream, that tumbles and eddies among the roots of the sweet brier, and dock, and harebells, as they hide modestly at the foot of the "long purples," looking out garishly from the bank that skirts the garden of your home; and the heaven above you is blue and peaceful, and the sultry tranquillity of the hour is broken only by the happy laugh indoors, or the sound of sisterly music; and your own heart is calm, pensive perchance, over a cherished hope, or nursing some day-dream of unfulfilled ambition; innocence is in the air, in the sky, on the earth, all around you and above you, and tempers soothingly the impulses of your own awakening spirit. Would that you might live here for ever! Earth has nothing richer to offer, as hereafter the mind, thrown back upon itself after a life of struggle, will testify.

Our happiness is not the choice of our judgment. If Eden were planted again, and you or I were a new Adam, we should not remain in it. Not all its loveliness nor wealth could satisfy the heart's desire to be up and doing, to feel its strength, and accomplish its destiny by its own efforts. If the world was not wide enough for Pyrrhus, how could a village Paradise fulfil his wants? Man is bigger than the material universe, more capacious than the possibilities of its riches,—stands above it, and looks beyond it. Not this nor that can satisfy you or me. An unrequited longing torments us, and hurries us to new scenes and toils. Wherever we go we feel straitened, for we are always greater than our place. No man, however much he may have failed in the matter of achievement in the eyes of others, ever felt that he had reached the limit of expansion. He always wants to break out in some forbidden direction. This desire often ruins him, and is the true secret of his failure; but the poor fool, self-deluded, does not know it.

Family oracles sometimes say, "Let him follow his own bent; he will do better if he goes to sea, or takes to rifle-shooting or the diggings." But such perverse people have unfortunately as many bends as a crooked stick, or the Thames from Richmond to Greenwich. They never run long in one direction. They try this to-day, and something else to-morrow; and on the third day they stand at the corners of the streets with their hands in their pockets, wondering what they shall do next. Now I will suppose that a wise father has given the proper bent to your mind, and that you, willingly following, have come to London to study the noble science and art of physic. What advice can I give you?

I will assume that you turn away from the solicitations of the metropolis,—that you are guided by the pure light of the old home still enveloping you as in a sanctuary, and shining upon your path. The word of caution is still in your ear, and the parting "God bless you!" mingling sweetly with every thought, and chastening the desires born of your new experiences. What then? You have taken your resolve in earnest, and are now a student.

You will commence your medical studies as you did your early lessons in the dame's school—by the exercise of your memory. You are a learner, and you will be expected to know that which is written and formulated. There is a whole museum of facts which you must label, and classify, and deposit in your mental bins and glass cases, and it will require all your industry to achieve creditably this work. Rely upon it, that you will find it *hard* work; so do not procrastinate, but cast off your holiday clothes, and make a beginning.

Whilst you will be thus labouring, you will be ploughing up your own mind, driving into it deep furrows, letting in the air and sunlight, and unconsciously sowing seeds that may grow up tares or wheat as may happen. It is this unconscious culture that should be jealously watched. The earth was made receptive and fruitful, and plants will spring up, whether the husbandman give his help or withhold it.

It is only a few years ago that your lecturers counselled you that the chief merit of a student was docility, modesty, a willingness to be taught, a subordination of your intellect to the wisdom and experience of your teachers. These counsels are seldom heard now; and for my own part I have never expatiated in this vein, for to me it was false and unsatisfactory. I saw that medical culture required a new spirit to be infused into it, that the science was rapidly progressing, facts accumulating beyond the power of classification, opinions changing upon all topics, authority becoming of little account, and as improvement could scarcely be expected from the elder professors, I hoped to make the student feel that upon him must devolve the duty and the glory of forming the science of the new epoch. I taught independence, self-reliance, a breakage of idols, and an honest examination of all facts and theories. Mind for mind, I would put the pupil on the level of the professor—perhaps above him; and if this teaching were revolutionary, I am glad now to know that the revolution is accomplished.

During this work of improvement, there must necessarily be a sifting of old opinions, and a re-examination of authoritative dogmas. How can the student avoid a knowledge of this strife? He learns it from the pages of the "Circular," from the gossip of the dissecting-room, from the tart antagonisms of rival teachers, from the observation of their practice in the wards. Shall he then be a passive recipient of contradictions and errors, or a judge rather, examining the witnesses, taking the evidence, and passing sentence according to the light of his own unbiassed intellect? Suppose he err, he is still no worse than one or more of his teachers; and if he err by the exercise of his own faculties, he is a gainer to the extent of the mental labour he threw into the work. Think

for yourself, then, my young friend; be not afraid; learn betimes to exercise the analytic and judicial faculties—for, believe me, this duty cannot be commenced too soon: and you will find that, in after-life, you will be a good practitioner in the exact degree of their strength and development.

Be not hasty either; we work best through patience. The greatest mechanical force is exerted by slow degrees; for what is lost in speed is gained in power. Time is an element in all great achievements. See how many millions of years, as the geologist tells us, the great Architect was occupied in framing this fabric of the world, how he laid its rocky foundations upon a formless rolling deep, powdered it again to sand, cemented with lime, ran veins of metal into all its winding fissures, consolidated it into a round ball, and then, covering it with a soft warm loam, sowed it with seeds innumerable, and blest it with inexhaustible fertility! Not by a single *fiat* was this masterpiece accomplished by Him who could have spoken it in a moment into perfection, but through the long ages, layer by layer, foot by foot, was He building up this palace of beauty and memorial of his power!

Is your pride fallen? No? Then consider how you grow; study the laws of your own being; "know thyself." An infant, feeble, helpless, lower than the animal in everything but the potentialities of your nature. The dome of thought, the brain, is not yet developed. Its posterior organs, or so much of it as subserves instinct and motion, are disproportionately large, and the anterior lobes, which are the instruments of the intelligence, continue for a time undeveloped and quiescent.

Then, as these enlarge, the senses acquire activity, and you begin to *know*. You are a fact medium, an apprehender of the qualities of things, a note-book of nature. You are yet incapable of an abstraction, your power of comparison embraces only the region of fact, you have attained to the dignity of a savage, you believe that which you can see and touch, that fire will burn, and ice chill, and you either deny or are indifferent to every affirmation the senses cannot demonstrate. Years roll on, the physical structure acquires fresh developments, the head elongates, and new sentiments and passions affect the mind and heave the breast. The imagination expands, and the powers of abstraction are conscious of a wonderful nativity. A change has come over your spirit; you can now joyfully achieve mental work, in which only a year since you found no pleasure. What a transformation is not this! You are a different being! You seem to have been endowed with a fresh consciousness; your relations to the world are strangely altered; some genius has appeared to you, and put into your hand a key to unlock the mysteries of Nature. You walk abroad uneasy and pensive under the golden cloud of a miraculous revelation. A power has been given to you which has not brought with it confidence but timidity, for it surpasses all your experience.

But you are not yet a man; you can indeed perceive law as well as fact, but the reason must grow in power as your muscles grow in strength. You are not yet a truth-measurer, but your inexperience allows you to believe anything true that has been revealed to your imagination. You are vain,—are you are not? You feel within you a great power of acquisition, you dress yourself in the purple robes of knowledge, your heart swells, and your mouth is full of speech,—hush! Speak softly; a sage glance pierces through this vesture of book-lore and measures your stripling limbs and puny strength.

Be patient, you will grow strong in time. Such power as you have, use it, for exercise is necessary to development; put out all your strength, that you may go beyond it. Measure yourself not with the known but the unknown, that you may have at once the boldness of the man militant, and the modesty of genius. To be deserving of applause it is necessary to do, rather than to acquire, to bring the unknown into the region of the known. When someone was praising Ptolemy in the presence of Philopœmen, this general remarked, "Who can praise a prince of his age who is always preparing, and never performs?" Prepare yourself indeed; but you shall be allowed no merit until you have proved your strength in the trial.

There is a power within us indeed equal to all efforts; but it must be supplied with external aliment. Wait and let the stream fill the open reservoirs. When the water shall have risen high enough, there will be an accumulation of force that may lift mountains. Alone we are nothing, we borrow strength from the world. As the wire conducts the electricity of the thunder-cloud so prepare yourself to receive the gathered forces as they flash past your watch-tower. Ideas enter, how we know not; but when one knocks give it welcome as to an angel, for it may be a master-thought, which all labouring humanity has for ages been striving to evolve. The least then is equal to the greatest, and the part absorbs the whole. The revealer is the depository of the general wisdom, the culmination of his epoch. We flow into one another, and the stream rises at particular points to its highest level, but we all help to give it passage. Be content then to wait and fit yourself for any vocation. Your particular line of pursuit is Medicine, now let us say a word about our science.

In studying Medicine, as a science, you will find two doctrines prevalent, one of which is based on the axiom that disease is essential or constitutional, the other, that it is local or special. These theories dominate the practice of the art, and divide the Profession into sects and into all possible diversities of opinion. The disciples of the first school have little confidence in long ranges of blue and white bottles; but they have implicit faith in the resources of Nature, and in fresh air, pure water, exercise, and the *vis medicatrix*. This doctrine leads, in its exaggerated manifestation, to some of the most popular forms of quackery, to the invention of the *elixir vitæ*, the vegetable heal-all, the blood purifiers of Morrison and Holloway, and the institution of water-cure establishments, hot-air and vapour baths, and similar organisations for cheating the unwary. The other doctrine as inevitably tends to the multiplication of remedial agents, to an almost superstitious faith in their efficacy, and to the formation of specialties in the healing art.

It concerns us to know, first, that which is true—if both be not true; and next, that which is most useful to us in our attempts to improve our art. The doctrine of "essentials" is simple, attractive, and eminently philosophical in its tendency, because it leads up to the discovery of one primitive cause. We see an example of it in Dr. Wilks' exposition of the unity of the malignant and benign cell, and another in Mr. Paget's recent declaration of his faith in Nature as a curative force.

But this doctrine does not explain disease, which must be looked for in the changes in the dynamic, chemical, and mechanical forces and conditions of the part diseased. It might be even true that the elementary constituents of organisation remain unchanged, nevertheless, the disease itself, as a conditional result of local changes in the nutritive forces, shall exist. There are subtle elements, too, that must be accounted for, though they cannot be weighed or measured. Then we must learn to regard disease as a series of diverse facts, capable of analysis and definition. Upon this method alone can medicine be pursued successfully as a science.

Let us apply these views to therapeutics, or the treatment of disease—the perennial problem and the practical end of medical science. There is a case of phthisis in Harvey Ward: how should it be treated?

"O," says Pneumatodes, "that is very easy. Consumption is caused by the deprivation of pure air, and consists of malnutrition; send him to the top of Snowdon, and feed him on cod-oil, and he will soon get well." Perhaps he may; but Kritos intervenes, "Not so fast, my friend, your nostrum is no use; I tried it, and my patient died. Consumption means more than you think: it is not merely the negation of health, it is a positive and complex disease. If there be ulcers in the larynx, your Snowdon air will, in a very short time, kill the patient, and if the stomach be in a state of chronic inflammation, your nutritive cod-oil will be his poison. No; my rule is to treat symptoms, and I find that every patient requires a different combination of remedies."

This is a familiar statement of the difficulty, and of the views taken of it in practice. What we want to know is, *why* cod-oil will cure one patient, and not cure another? Why is it that one doctor will cure rheumatism with nitrate of potass, and another fail with that and succeed with colchi-

cum; whilst a third will find opium the only remedy? There may be certain conditions of the disease, as Dr. Latham has recently remarked, in the several groups of cases, which modify the action of the remedies, and our business should be to discover those conditions. We must not delude ourselves with the truism that disease is merely the absence of good health, and that hygiene is the most philosophical system of therapeutics. If this doctrine were true, to the exclusion of any other, there would be no purpose in the study of individual diseases, except as a matter of curiosity, and medical science, pathology, diagnosis, and therapeutics, would come to an end.

Medical science can be advanced only by analysis and induction. My own belief is that, notwithstanding we number diseases already by scores, there are scores yet to be distinguished, and that it is this imperfection of our analysis that is the chief cause of our failure as practitioners. Take scarlatina. I have no doubt that diphtheria, now distinguished as a separate affection, has been for ages confounded with scarlatina, and subjected to the same treatment. We shall be more skilful in curing both for defining them with accuracy.

Again, I have observed, season after season, epidemics of a disease commonly called scarlatina, and passing current in the Profession itself under that name, which, for twenty years, at least, I have been accustomed to distinguish as a different disease—a species of urticaria. These are regarded sometimes as mild cases of scarlatina, sometimes as measles, and sometimes, too, as measles and scarlatina concurrent, for such examples I have frequently seen reported in the Medical Journals. The instances of second attacks of scarlatina and measles are generally attributable to this mistake in diagnosis.

Here, my young friend, is a fine field before you. Observe the cases in the wards with your own eyes, and do not look through other men's spectacles. Analyse—analyse—analyse! It is in the more minute division and definition of disease that we shall find the straight road to an intelligible, consistent, and successful practice. Do not ask yourself whether you are studying your profession inductively or deductively, nor inquire of anybody else whether you would be thought a cleverer fellow if you worked in one way rather than the other. Satisfy the authority of Truth by analysing the facts that lie before you, and do not fear that Truth herself will ultimately crown your genius.

Another fruitful source of error in estimating the efficacy of remedies is the omission to ascertain what would be the result without medicine of any kind. If a patient get well from an attack of rheumatism in six weeks with colchicum, or in seven weeks with potash, how long would the disease have continued had Nature worked her own cure? The difference would show the value of the medicine. Then, again, it is important to determine *how* Nature works the cure. We are very apt to deceive ourselves in this respect, and to form false conclusions. There are some who think that the profuse perspiration in rheumatic fever is eliminative, and should be encouraged; others, that it is a part of the disease itself, is baneful, and should be controlled. Which view is right? Upon a correct answer to this question depends the true indication of treatment.

Take, again, for an example the little operation of vaccination. It is ordinarily thought that the vesicle is primarily the effect of local irritation, and, secondarily, the local effect of changes induced in the system by the matter originally inserted. My opinion is different: I think that the vesicle is not a mere effect of local irritation, or of systemic changes, but that it is itself a *cause* of those changes; that it is a laboratory for the formation of the virus which is absorbed into the system. The proved fact that the security of the patient is proportionate to the number of the pocks is due to this function of the vesicle. Here are at least two views of one phenomenon. Nature's ways must be closely studied, the healing process must be tracked and analysed, the tides and times of disease must be recorded to form the fundamental axioms of scientific therapeutics.

I cannot continue these illustrations. Let me remind you that sound principles are useless without faithful practice, and that doctrine and discipline should knit hands. Talent ever waits upon industry, and speculation upon fact. Like Glaisher's balloon, you must be duly ballasted, or your flight may be too high to be serviceable. The regions of speculation are beautiful to look at from below, brilliant with many colours, and infinite in their unsearchable depths; but rise to their altitude, and you will find that they are cold and dark and chilling, that they paralyse the senses and deaden the soul. If you would recover the use of your faculties, you must let off the gas and descend to a denser medium.

The strictest guardian, too, of virtue is study. It is the sword of Heimdall, the watchman of Asgard, and keeps the giant passions at a distance from the celestial portals. A lazy man is accessible to every temptation, and he learns too late that neither knowledge nor virtue will abide with indolence. Keep this truth ever in view; for sloth is the dry rot of the soul, the wire-worm that eats to the heart of the oak, and crumbles its solid texture to powder. Get knowledge; it is good in itself, it is good for you, it is good for mankind; get it honestly,—that is, by your own labour; do not steal it. But it would be better even to steal it than to despise it.

When Demetrius had taken Megara after a siege, he asked Stilpo the philosopher if his soldiers "had taken anything from him?" "No," replied Stilpo, "I found none that wanted to steal my knowledge." This answer was double-edged; it implied first that Stilpo valued all other things as nothing against knowledge, and that the plunderer valued knowledge as nothing against all other things. Each animal after his kind; the libertine to his lust, the horse to his manger, the swine to his trough, the true man to his duty. You must make your election now whilst you stand in the forked path; and I hope that it will be such as the experience of riper years will not repent.

GEORGE ROSS.

NOTICE TO CORRESPONDENTS.

In consequence of the occupation of our space with the contents of the Students' Guide, we are constrained to postpone our ordinary information and correspondence to the next number.

SESSION 1862-63.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

Office—Soho square, London.

REPORT OF THE GENERAL COMMITTEE ON EDUCATION,

Adopted by the General Council July 6th, 1861.

I.—*General Education and Examination.*

The Medical Council are of opinion that it is desirable—

1. That all students pass an examination in general education before they commence their professional studies.

2. That the time of commencing professional studies shall be understood to be the time of commencing studies at a medical school, and that no qualifying body be held to have complied with the recommendation of the Council which shall allow the examination in general education to be passed after the commencement of professional study.

3. That, as far as may be practicable, testimonials of proficiency granted by the national educational bodies, according to the following list, be accepted, with such modifications as the Medical Council may from time to time think proper to make:—

A Degree in Arts of any University of the United Kingdom, or of the colonies, or of such other Universities as may be specially recognised from time to time by the Medical Council. Oxford Responsions or Moderations. Cambridge Previous Examinations. Matriculation Examination of the University of London. Oxford Middle-class Examinations, Senior and Junior.* Cambridge Middle-class Examinations, Senior and Junior.* Durham Middle-class Examinations, Senior and Junior.* Durham Examinations for Students in Arts, in their second and first years. Durham Registration Examination for Medical Students. Dublin University Entrance Examination. Queen's University, Ireland, two years' Arts course for the Diploma of Licentiate in Arts; Preliminary

* After January 1st, 1863, all Junior Middle-class Examinations will be excluded from the list.

Examinations at the end of A.B. course; Middle-class Examinations; Matriculation Examinations. First-class Certificate of the College of Preceptors.

4. That the Examination in General Education be eventually left entirely to the examining boards of the national educational bodies recognised by the Medical Council.

5. That no certificate of proficiency in general education, which does not affirm the proficiency of the candidate in Latin, be deemed a sufficient proof of preliminary education previous to the commencement of professional studies.

6. That students who cannot produce any of the testimonials referred to in the third resolution, be required to pass an examination in Arts, established by any of the bodies named in Schedule (A) of the Medical Act, and approved by the General Council, provided that such examination be in every case conducted by a special board of examiners in Arts.

7. That without professing to lay down any complete scheme of general education for persons intending to become members of the Medical Profession, the Committee recommend that the scheme of examination in Arts of the licensing bodies be, as nearly as practicable, similar to that of any of the national educational bodies above specified.

8. That after October 1st, 1861, all medical students be required to be registered.

9. That the list of students registered be closed within fifteen days after the commencement of each session or term.

10. That no student beginning professional study after September, 1861, be registered, who has not passed an Arts examination, in conformity with resolutions 3 or 6.

11. That the several bodies in Schedule (A) of the Medical Act, either jointly or severally, open a register for students commencing their studies in Medicine, in the form annexed.

12. That after January, 1863, all Junior Middle-class Examinations be excluded from the list.

13. That the said register be opened on the first day of each session or term, and remain open for fifteen days; and that within seven days after its close the officer in charge transmit a duly authenticated copy thereof to the Registrar of the Branch Council of that division of the United Kingdom to which the body or bodies belong.

14. That the Registrar of the Branch Council lay the copy of the said register before the Branch Council, in order that the Branch Council may take whatever steps may seem necessary to secure its accuracy; and that it be thereafter transmitted, with any remarks by the Branch Council thereon, to the Executive Committee.

15. That the licensing bodies shall have power to admit exceptions as to the time of registration, if satisfactory to them, and transmit lists of such exceptions to the Branch Council of the part of the United Kingdom in which such exceptions shall have been granted, with the grounds stated.

16. That the various educational and licensing bodies be requested to transmit to the Registrar of the General Council returns embodying any alterations which they may from time to time introduce into their courses of general study and examinations which qualify for the registration of medical students; and that a copy of such returns be sent by the Registrar, as soon as convenient, to each member of the General Council.

II.—*Professional Education.*

17. That the age of twenty-one be the earliest age at which any professional licence shall be obtained.

18. That four years of professional study be required, after the examination in general education.

III.—*Professional Examinations.*

19. That the professional examinations be divided into at least two distinct parts; that the first be not undergone until after the termination of two years of study, and the final examination not until after the termination of four years of study.

20. That the first professional examination be conducted partly in writing and partly *viva voce;* and that such parts as admit of it be made as practical and demonstrative as possible.

21. That the second examination be conducted partly in writing, partly *viva voce,* and practically, so far as may be convenient and attainable.

22. That the professional examinations be held by the several licensing bodies (except in special cases) at stated periods, to be publicly notified.

23. That returns from the licensing bodies under Schedule (A) be made annually on the 1st of January, to the General Medical Council, stating the number and names of the candidates who have passed their respective final examinations, and the number of those who have been rejected.

24. That it be recommended to all the examining boards that they should require from every candidate for examination before them a statement, signed by himself, whether he has, or has not, been rejected within three months by any of the examining boards included in Schedule (A) of the Medical Act.

25. That it is not desirable that any University of the United Kingdom should confer any degree in Medicine or Surgery, whether that of Bachelor, Doctor, or Master, upon candidates who have not graduated in Arts, or passed all the examinations required for the Bachelorship in Arts, or the examinations equivalent to those required for a degree in Arts.

Schedule.—Register of Medical Students.

No.	Name.	Date of Birth.	Place of Birth.	Present Residence.	Date of Registration.	Place of Study.	Registering Body.	What Examination in Arts, and its Date.
1	A. B.	—	—	London	—	University College, London.	University of London.	Matriculation Examination of University of London; May, 1861.
2	C. D.	—	—	Birmingham	—	Birmingham General Hospital.	Royal College of Surgeons of England.	Oxford Middle-Class Examination; August, 1861.

UNIVERSITY OF LONDON.

Burlington House.

Visitor—Her Majesty the Queen.
Chancellor—The Earl Granville, K.G.
Vice-Chancellor—George Grote, Esq., D.C.L., &c., &c.
Registrar—W. B. Carpenter, M.D.
Chairman of Convocation—Dr. Foster.
Clerk of Convocation—Wm. Shaen, Esq., M.A.
Clerk to the Senate—Mr. H. Moore.
